* Strabo derives the word *βαρβαρος* from *βαρβαριζω*, *barbarize*, by reason foreigners coming to Athens used to stammer, or speak coarsely: others derive it from *βαρβαρ*, a word that foreigners frequently stumbled on, which yet had no meaning; others from the Arabic *bar*, a desert; Vossius from the Chaldee adverb *בָּרַ*, *extra, foris*.

BARBARISM*, in grammar, denotes an offence against the purity of style or language.

A *barbarism* differs, according to Isidore, from a barbarous term, as the former, for instance, is Latin, though corrupt or misused; whereas the latter, which this writer calls *barbarologia*, is a word merely foreign, intruded into Latin speech.

BARBE, or **BARB**, in commerce, a kind of horse brought from Barbary, much esteemed for its beauty, vigour and swiftness. *Barbs* are usually of a slender make, and their legs far apart. It is a maxim, That *barbs* grow ripe, but never old; because they retain their vigour to the last, which makes them prized for stallions: their mettle, according to the duke of Newcastle, never ceases but with their lives.

It is said, they were anciently wild, and run at large in the deserts of Arabia; and that it was in the time of the Cheq Ishmael, that they first began to tame them. It is said there are *barbs* in Africa that will outrun ostriches, such are ordinarily sold, according to Dapper, for 1000 ducats, or 100 camels. They are fed very sparingly, Dapper says with camel's milk. It is added, that in Barbary they preserve the genealogy of their *barbs*, with as much care as the Europeans do those of their noble families; and that to sell them, they always produce their titles of nobility.

The race of horses is much degenerated in Numidia; the Arabs having been discouraged from keeping it up, by the Turkish officers, who were sure to be masters of them. At present the Tingitanians, and Egyptians, have the reputation of preserving the best breed, both for size and beauty. The smallest of these last are usually sixteen hands high, and all of them shaped, according to their phrase, like the antelope.

The good conditions of a Barbary horse (besides the supposed quality of never lying down, and of standing still when the rider drops his bridle) are to have a long walk, and to stop short, if required, in a full career.

BARBE, in the military art.—To *fire en BARBE*, is to fire the cannon over the parapet, instead of through the embrasures; in which case the parapet must not be more than three foot and a half high.

BARBE, or **BARDE**, is also an old term for the armour of the horses of the ancient knights, and soldiers, who were accoutred at all points.

Della Crusca says, the *barde* is an armour of iron or leather, wherewith the neck, breast, and shoulders of the horse are covered.

BARBER. See **CHIRURGERY**.

BARBICAN. See the article **BARBACAN**.

BARBING is sometimes used in ancient statutes for sheering.

Cloth is not to be exported till it be *barbed*, rowed and thorned.

3 H. 7. c. 11.

BARBOTINE, a seed, otherwise called *semen fantonicum*, and *semen contra vermes*, in English *wormseed*. See **WORMSEED**.

BARDE. See the article **BARBE**.

BARDESANISTS, a sect of ancient heretics, thus denominated from their leader, Bardesanes, a Syrian of Edeffa, in Mesopotamia.

Bardesanes, born in the middle of the second century, became eminent after his conversion to Christianity, for his piety and learning; but especially for his zeal against heretics, against whom, we are informed by St. Jerome and Eusebius, he wrote a multitude of books: yet had he the misfortune to fall, himself, into the errors of Valentinus, to which he added some others of his own. He taught, that the actions of men depend altogether on fate, and that God himself is subject to necessity. His followers went further, and denied the resurrection of the body, and the incarnation and death of our Saviour; holding, that these were only apparent or phantastical.

Strunzius has given the history of the *Bardesanists*.

BARDS;

BARDS, BARDI, ancient poets among the Gauls and Britons, who described and sung in verse the brave actions of the great men of their nation; with design to inculcate and recommend virtue, and even sometimes to put an end to the difference between armies at the point of engagement.

* Bochart derives the word from *parat*, to sing. Camden agrees with Feltus, that *bardus* originally signifies a singer: and adds, that the word is pure British. Others derive the word from *Bardus*, a druid, the son of Dryis, and the fifth king of the Celts.

The *bards* differed from the *druids*, in that the latter were priests and teachers of the nation, but the former only poets and writers.

Larrey, Bodin, and Pasquier, indeed will have the *bards* to have been priests, as well as philosophers: and Cluverius, orators too: but without much foundation in antiquity. — Strabo divides the sects of philosophers among the Gauls and Britons into three, *viz.* the druids, *bards*, and evates. The *bards*, adds he, are the fingers and poets; the evates, the priests and natural philosophers; and the druids, to natural philosophy add also the moral. Hornius however reduces them to two sects, *viz.* *bards*, and druids; others to one, and make druid a general name comprehending all the others. Cluverius will have it, that there were *bards* also among the ancient Germans; because Tacitus makes mention of their songs and poems which contained their history.

BARE-pump. } **PUMP.**

BAR-FEE, a fee of 20 pence, which every person acquitted of felony pays the gaoler.

BARGE, a kind of state, or pleasure-boat, used chiefly in the navigation of rivers which lead to great cities.

Barges are of various kinds, and acquire various names, according to the variety of their uses and structures: as,

<i>A company's barge,</i>	<i>A Severn-traw,</i>
<i>A roso-barge,</i>	<i>A Ware-barge,</i>
<i>A royal-barge,</i>	<i>A light horseman,</i>
<i>A sand-barge,</i>	<i>A West-country-barge.</i>

BARK*, the exterior part of trees, serving them for a skin or covering.

* In writers of the last age, this is sometimes also called *bast*.
Vid. 15 Cur. 2. c. 2.

The bark of trees in general is of a spongy texture; and, by many little fibres which pass through the capillary tubes whereof the wood consists, it communicates with the pith; so that the proper nutriment of the tree, being imbibed by the roots, and carried up through the fine arterial vessels of the tree by the warmth of the soil, &c. to the top of the plant, is usually supposed to be there condensed by the cold air, and in that form returns by its own gravity down the vessels, which do the office of veins, lying between the wood and inner bark; leaving, as it passes by, such parts of its juice as the texture of the bark will receive, and requires for its support. See **WOOD**.

That soft whitish rind or substance between the inner bark and the wood, which Mr. Bradley thinks to do the office of veins, some account a third bark, only differing from the others in that its fibres are closer; 'tis this contains the liquid sap, gums, &c. found in plants in the spring and summer months. It hardens by little and little, by means of the sap it transmits, and is converted imperceptibly into the woody part of the tree. There are few trees but what have it; yet it is still found in less quantity, as the tree is more exposed to the sun: that of the oak is ordinarily about an inch thick. It is here that the corruption of trees generally begins, whence those who fell and cut out trees ought always to take care to leave as little of it on, as possible.

There are a great many kinds of barks in use in the several arts: some in medicine, as the *quina*, or *jesuit's bark*, *macer*, *chacarilla*, &c. others in dyeing, as the bark of the alder; others in spicery, as *cinnamon*, *castia lignea*, &c. the bark of oak in tanning; others on other occasions, as *cork*; that of the linden-tree for cordage for wells; that of a kind of birch is used by the Indians for canoes, capable of holding twenty-four persons.

The ancients wrote their books on *barks*, especially those of the ash and tilia or lime-tree; not on the exterior or outer bark, but on the inner and finer, called *phlyra*; which is of so durable a texture, that there are manuscripts on it still extant a thousand years old.

In the East-Indies they manufacture the bark of a certain tree into a kind of stuff or cloth. It is spun and dressed much after the manner of hemp. The long filaments separated from it, upon beating and steeping it in water, compose a thread, of a middle kind between silk and common thread; neither so soft nor bright as silk, nor so hard or flat as hemp.

Some of these stuffs are pure bark, and are called *pinasses*, *biam-bonnes*, &c. In others they mix silk with the bark, and call them *Ginghams* and *Nillas*: the *Foutalungees* too are part silk, part bark, and are only distinguished by being striped.

BARK-Mills. } See the articles { **MILL.**
Grafting in BARK. } **ENGRAFTING.**

BARK*, in navigation, denotes a little vessel for the sea, usually with pointed or triangular sails, in number two, or three at the most.

* The word is derived by some from the Latin *barca*; Four-nier from *Barce*, a city in Africa; and Toletanus from *Barcelona*; others, among whom is Salmastus, from the Greek, *καπη*, a round building; Scaliger from *βαπος*, burthen.

Some authors use the word *bark* for any vessel that has no masts. — Of *barks* there are various kinds: as,

<i>A binlander,</i>	<i>A fruit,</i>
<i>A sail,</i>	<i>A snail,</i>
<i>A jettee,</i>	<i>A snake.</i>

BARK-BINDING, a distemper incident to trees, cured by flitting the bark, or cutting it along the grain, *viz.* in apple-trees by cutting frait down.

BARK-GALLING is when trees are galled by thorns, or by being bound to flakes, &c. It is cured by clay laid on the galled place, and bound on with hay.

BARKING of trees is the peeling off or stripping the bark from the wood.

The month of May is the season for *barking* of trees, because then the sap loosens the bark from the wood; which it is very hard to effect in any other time, unless the season be very wet; heat and dryness being always opposite thereto.

Malignantly *barking* of apple-trees or other fruit-trees is made felony, by 37 H. 8. c. 6.

BARLEY-Sugar. See the article **SUGAR**.

BARM, otherwise called *yauf*, the head or workings out of ale or beer. See **LEAVEN**.

BARNABITES, an order of religious, thus called from the church of St. Barnabas at Milan, where they were first established; and not, as some have imagined, because St. Barnabas was their patron: in reality St. Paul is the patron of the *Barnabites*.

The *Barnabites* are regular priests of the congregation of St. Paul. Their habit is black, and the same with that they wore when first established, in 1533, by the express bulls of Pope Clement VII. Their office is to instruct, catechize, and serve in missions.

BARNACLE*, in natural history, a bird of the goose kind, frequent in the western isles of Scotland; concerning whose origin and species many fables have been advanced.

* The word is also written *bernacle*, agreeably to its supposed etymon, from the Saxon *bearn*, a child.

Several authors have represented the *bernacle* as the produce of a marine animal, or shell-fish: but the later naturalists on better grounds refer it to the natural manner of generation of the feathered kind; making it a real goose, produced like others *ad ova*. See a description and draught of it in Sir Rob. Sibbald's Nat Hist. Scot.

The *bernacle* is the same with what is otherwise called the *Soland goose*, in Latin *anser Scoticus*; some will have it the same with the French *macreuse*, or *macrout*; and others with the *diable de mer*, but erroneously: Dr. Robinson assigns the difference: making the *bernacle* to be of the goose, the *macreuse* of the duck, and the *diable de mer* of the moorhen kind. — The same author shews, that the *macreuse* is no other than the *feater*, or *anas niger minor*, described by Mr. Ray and Willughby; contrary to the opinion of M. Cattier, who took it for the greater *cost* of Bellonius; and also of others, who mistook it for the puffin of the Scyllies and isle of Man; and of others with whom it passed for a sort of *co-lymbus* or *doucher*. See *Ray Syn. Meth. Avium*, p. 141.

BARNACLES, also denote an instrument which farriers apply to horses' noses when they will not stand quietly to be shod, blooded, dressed, or the like.

BAROCO, in logic, denotes the fourth mode of the second figure of syllogisms.

A syllogism in *baroco* has the first proposition universal and affirmative, but the second and third particular and negative; and the middle term the attribute in the two first.

For example,

BA	Every virtue is attended with discretion:
RO	Some kinds of zeal are not attended with discretion:
CO	Therefore some kinds of zeal are not virtues.
BAR	Nallus homo non est bipes:
OC	Non omne animal est bipes:
O	Non omne animal est bipes.

BAROMETER*, a machine for measuring the weight of the atmosphere, and the variations therein, in order chiefly to determine the changes of weather.

* The word is compounded of *βαρος*, weight; and *μετρον*, measure.

The *barometer* is frequently confounded with the *baroscope*, though somewhat improperly; the latter, in strictness, being a machine that barely shews an alteration in the weight of the atmosphere: but it is one thing to know that the air is heavier at one time than at another, and another to measure how much that difference is; which is the business of the *barometer*.

The *barometer* is founded on the Torricellian experiment, as it is called from its inventor Torricelli: which is no more than a glass tube filled with mercury, hermetically sealed at one end; the other open, and immersed in a basin of flag-nant

nant mercury. Now, as the weight of the atmosphere diminishes, the mercury in the tube will here descend; on the contrary, as it increases, the mercury will again ascend: the column of mercury suspended in the tube being always equal to the weight of the incumbent atmosphere; as is shewn under the word *TORRICELLIAN*.

Common BAROMETER.—The construction thereof is thus: a glass tube AB, (*Tab. Pneumatica*, fig. 1.) hermetically sealed in A, having its diameter about $\frac{1}{2}$ of an inch, and its length, at least, thirty-one inches, is filled with mercury so justly, as not to have any hair over it, nor any bubbles adhering to the sides of the tube; which is best done by means of a glass funnel, with a capillary tube. The orifice of the tube, filled after this manner, so as to overflow, is then closely pressed by the finger, so as to exclude any air between it and the mercury; and thus immersed in a wooden vessel, of a convenient diameter, so, however, as not to touch the bottom: at the distance of twenty-eight inches from the surface of the mercury, are fixed two plates, CE and DF, divided into three inches, and these again subdivided into any number of smaller parts.—Lastly, the tube is inclosed in a wooden frame, to prevent its being broke; and the basin, though open to the air, is cured from dust: and the barometer is complete.

Many attempts have been made to render the changes in the barometer more sensible, and so to measure the atmosphere more accurately; which has given rise to a great number of barometers of different structures.—Hence the *wheel barometer*, *diagonal barometer*, *horizontal barometer*, *pendant barometer*, &c.

Des Cartes, and after him Huygens, used a tube AB, (*fig. 2.*) having a cylindric vessel CD; one half of which vessel, together with the upper part of the tube, were filled with water; the other half of the vessel, and the lower part of the tube, with mercury.—But here, though the column suspended was larger, and consequently the variation greater, yet the air, imprisoned in the water, getting loose by degrees, filled the void space in the top, and so ruined the machine.

Huygens then bethought himself of placing the mercury a-top, and the water at bottom, in the manner following: ADG, (*fig. 3.*) is a bent tube hermetically sealed in A, and open in G; the cylindric vessels BC and FE are equal, and about twenty-nine inches a-part; the diameter of the tube is about a line, that of each vessel fifteen lines, and the depth of the vessels is about ten; the tube is filled with mercury (the common barometer standing about twenty-nine inches) which will be suspended between the middle of the vessel FE, and that of the vessel BC; the remaining space to A, being void both of mercury and air: lastly, common water, tinged with a sixth part of aqua regis, to prevent its freezing, is poured into the tube FG, till it rises a foot above the mercury in DF.

When, then, the mercury rising above the level of that contained in FE, through the tube AD, becomes a balance to the weight of the atmosphere; as the atmosphere increases, the column of mercury will increase, consequently the water will descend; as the atmosphere again grows lighter, the column of mercury will descend, and the water ascend. This barometer therefore, which is the same with that of Dr. Hook, will discover much minuter alterations in the air than the common one: for, instead of two inches, the fluid will here vary two foot; and by enlarging the diameters of the cylinders, that variation may be still increased: but it has this inconvenience, that the water will evaporate, and so render the alterations precarious; though the evaporation be, in some measure, prevented by a drop of oil of sweet almonds swimming a-top.—On account of this defect, others have had recourse to a

Horizontal, or rectangular BAROMETER, ABCD, (*fig. 4.*) the tube whereof is bent, in form of a square BCD; a-top of its perpendicular leg it is joined to a vessel or cistern AB; and its variation accounted on the horizontal leg CD.

Now here the interval, or space of variation, may be made of any extent at pleasure, and so the minutest change in the air become sensible. For the diameter of the tube CD being given, it is easy to find the diameter of the vessel AB so as that the scale of descent in the tube DC shall have any given proportion to the scale of ascent in the vessel AB; the rule being, that the diameter of the vessel is to that of the tube in a subduplicate reciprocal ratio of their scales.

The diameters then of CD and AB being given, together with the scale or ascent of the mercury in the vessel, the scale of mercury in the tube is found thus: as the square of the diameter of the tube is to the square of the diameter of the vessel, so, reciprocally, is the scale of mercury in the vessel, to the scale of mercury in the tube.

This and the preceding contrivance of Huygens are founded on a theorem in hydrostatics, viz. that fluids having the same base, gravitate according to their perpendicular altitude, not according to the quantity of their matter; whence the same weight of the atmosphere supports the quicksilver that fills the tube AD and the cistern B, as would support the mercury in the tube alone.

This last, however, with its virtues, has great defects; for, by reason of the attraction between the parts of the glass and of

the mercury, (which Dr. Jurin has shewn to be considerable) with the length of the scale, (consequently the quantity of motion) and the attrition against its sides, especially in sudden rises and descents, the mercury breaks, some parts of it are left behind, and the equality of its rise and fall ruined.—Some therefore prefer the

Diagonal BAROMETER, where the space of variation is considerably larger than in the common one, and yet the rise and fall more regular than in the others.—Its foundation is this; that in a Torricellian tube BD, (*fig. 5.*) inclined at any angle to the horizon, the cylinder of mercury equivalent to the weight of the atmosphere is, to a cylinder of mercury equivalent to the same placed in a vertical tube, as the length of the tube BC to the perpendicular height DC. Hence, if the height DC be subtriple, subquadruple, &c. of the length of the tube, the changes in the diagonal barometer will be double, or triple, &c. of the changes in the common barometer. This barometer will scarce allow its tube to be inclined to the horizon at a less angle than 45° , without undergoing the inconvenience of the horizontal one.

Wheel-BAROMETER. This was a contrivance of Dr. Hook, to make the alterations in the air more sensible; the foundation of this is the common vertical barometer, with the addition of a couple of weights A and B, (*fig. 5.*) hanging in a pulley, the one of them playing at liberty in the air, the other resting on the surface of the mercury in the tube, and rising and falling with it.

This is the motion of the mercury communicated, by means of the pulley, to an index which turns round a graduated circle; and thus the three inches of vertical ascent are here improved to five, or six, or more, at pleasure.

But the friction of the parts, in the pulley, and index, is so considerable, that unless the machine be made with a great deal of accuracy, it does not answer.

Pendant BAROMETER is a machine rather pretty and curious, than useful. It consists of a conical tube, placed vertically, its upper and smaller extreme hermetically sealed; it has no vessel or cistern, its conical figure supplying that defect: for when filled, like the rest, there will be as much mercury sustained as is equivalent to the weight of the atmosphere; and as that varies, the same mercury takes up a different part of the tube, and so becomes of a different weight.

Thus, when the weight of the atmosphere is increased, the mercury is driven up into a narrower part of the tube, by which means its column is lengthened, and, for the reason just given, its weight increased. Again, the atmosphere decreasing, the mercury sinks into a wider part of the tube, by which means its column is again shortened, and its pressure accordingly weakened. Thus, the same mercury is still a balance to the atmosphere under all its variations.

The inconvenience in this barometer is, that, to prevent the mercury and air from changing places, the bore of the tube must be very small; which smallness of the bore renders the friction so sensible, as to impede its playing.

Marine BAROMETER is likewise a contrivance of Dr. Hook, to be used at sea, where the motion of the waves renders the others impracticable. It is nothing more than a double thermometer, or a couple of tubes half filled with spirit of wine; the one hermetically sealed at both ends, with a quantity of common air inclosed; the other sealed at one end, and open at the other.

Now, the air, we know, is able to act on the spirit of wine, and raise it, two ways; the one by its gravity, as in the Torricellian tube; the other by its heat, as in the thermometer. If then the two tubes be graduated, so as to agree with each other at the time when the air is inclosed, it will easily follow, that, where-ever the two agree afterwards, the pressure of the atmosphere is the same, as at the time when the air was inclosed. If in the thermometer open to the air the liquor stand higher, considering what how much the other is risen or fallen from the other cause of heat or cold, the air is heavier; on the contrary, when it is lower, compared with the other, the air is lighter than at the time when the instrument was graduated.

Here the spaces answering to an inch of mercury will be more or less, according to the quantity of the air inclosed, and the smallness of the tubes; and they may be increased, almost, in any proportion.

But it must be remembered, that the density and rarity of the air, on which this machine is founded, do not only depend on the weight of the atmosphere, but also on the action of heat and cold.—This, therefore, can never be a just barometer; but may properly enough be called a *manoscope*, or instrument to shew the density of the air. See *MANOMETER*. Nevertheless, the instrument is said to be of good use in giving notice of all bad weather at sea, as also of veerable winds, and of the neighbourhood of ice. *Phil. Transf. N^o. 429. p. 133.*

Statical BAROMETER, or *BAROSCOPE*, used by M^r. Boyle, Otto de Gueric, &c. is ingenious, and liable to be misled on by a double cause: it consists of a large glass bubble, balanced by a brass weight, in a nice pair of scales: for these two bodies being of equal gravity, but unequal bulk, if the medium in which they equiponderate be changed, there will follow a

change of their weight; so that if the air grows heavier, the greater body, being lighter in specie, will loose more of its weight than the lesser and more compact; but if the medium grow lighter, then the bigger body will outweigh the less.

The most accurate *barometer* yet invented seems to be that of Mr. Cawell; the structure whereof he describes as follows: suppose ABCD, (fig. 6.) a bucket of water, wherein is the *barometer x r e z y o s m*, consisting of a body *x r s m*, and a tube *e z y o*. The body and tube are both concave cylinders, communicating with each other, made of tin, or rather glass. The bottom of the tube, *z y*, has a lead weight to sink it, so as the top of the body may just swim even with the surface of the water, by the addition of some grain weights a-top. The water, when the instrument is forced with its mouth downwards, gets up into the tube to the height *g o*. There is added on the top a small concave cylinder, which we call the *pipe*, to distinguish it from the other at bottom, which we call the *tube*: this pipe is to sustain the instrument from sinking to the bottom. *m d* is a wire, *m S* and *d e* two threads oblique to the surface of the water, performing the office of diagonals. Now, while the instrument sinks more or less, by the alteration of the gravity of the air; there, where the surface of the water cuts the thread, is formed a small bubble, which ascends up the thread, as the mercury of the common *barometer* ascends, and *vice versa*.

This instrument, as appears from a calculation which the author gives, shews the alterations in the air more accurately than the common *barometer*, by no less than 1200 times. He observes, that the bubble is seldom known to stand still a minute; that a small blast of wind, that cannot be heard in a chamber, will make it sink sensibly; and that a cloud always makes it descend, &c.

Portable BAROMETER. See the article PORTABLE.

Phænomena of the BAROMETER.—The phenomena of the *barometer* are various; the causes assigned for them, by several authors, are widely different; nor is its use in predicting the weather yet perfectly ascertained.

On the top of Snowdon-hill, 1240 yards high, Dr. Halley found the mercury to be lower by three inches eight tenths, than at the foot thereof; whence it appears, that at every 30 yards the mercury sinks $\frac{1}{10}$ of an inch. Mr. Derham, from some experiments he made at the top and bottom of the monument, allows 32 yards perpendicular ascent, to a fall of the mercury of $\frac{1}{10}$ of an inch: whence we have not only a foundation for determining the height of the atmosphere, which, on this foundation (were it equally dense every where) would not be found more than 5 miles and $\frac{1}{10}$; but also a very accurate method of measuring the height of mountains. Thus, if on the surface of the earth the mercury be at 30 inches, at 1000 foot high, it will be at 28,91 inches; at 2000 foot, 27,86; at 3000, 26,85; at 4000, 25,87; at 5000, 24,93; at 1 mile, 24,07; at 2 miles, 20,29; at 5 miles, 11,28; at 10 miles, 4,24; at 15 miles, 1,60; at 20 miles, 0,95; at 30 miles, 0,08; at 40 miles, 0,012; though it must be observed, this is on a supposition that the atmosphere is equally dense every where.

The greatest height the mercury has been known to stand at in the *barometer*, at London, is 30 inches $\frac{3}{4}$, its least 28 inches; its greatest height at the observatory of Paris, has been found 28 inches $\frac{3}{4}$, and its least 26 $\frac{1}{4}$ of the Paris foot, which exceeds the London foot by $\frac{1}{12}$; and with these observations agree others, made at Hall, in Saxony, by Wolfius. At Algiers it rises to 30 inches $\frac{3}{4}$ or $\frac{1}{2}$, with a northerly wind, though attended with the greatest rains and tempests. *Shaw. Trav. p. 218.*

It is true, there is an experiment wherein the height of the mercury is found surprizingly to exceed these numbers; mercury perfectly purged being suspended in a tube, in the Torricellian way, at the height of 75 feet; though by the least shake it falls down to the ordinary height. See an account of this phenomenon under the word TORRICELLIAN.

The phenomena of the *barometer*, Mr. Boyle observes, are so very precarious, that it is exceedingly difficult to form any general, certain rules about the rise or fall thereof. Even that which seems to hold most universally, *viz.* that, when high winds blow, the mercury is the lower, sometimes fails.

Dr. Halley gives us the following observations: that in calm weather, when the air is inclined to rain, the mercury is commonly low; in serene good settled weather, high.

That on great winds, though unaccompanied with rain, the mercury is the lowest of all, with regard to the point of the compass the wind blows on. That, *cæteris paribus*, the greatest heights of the mercury are on easterly and north-easterly winds. That after great storms of wind, when the mercury has been low, it rises again very fast. That in calm frosty weather it stands high.

That the more northerly places find greater alterations than the more southern*: and that within the tropics, and near them, there is little or no variation of the height of the mercury at all.

* For instance,—at Naples it hardly ever exceeds an inch; whereas,—at Upminster it is 2,5 inches,—at Peterburgh 2,3 1/2. *Phil. Trans. n. 434. p. 407.*

Dr. Beal observes that, *cæteris paribus*, the mercury is higher in colder weather than in warm; and usually in the morning and evening higher than at mid-day.

That, in settled and fair weather, the mercury is higher than either a little before or after, or in the rain; and that it generally descends lower after rain than it was before it. If it chance to rise higher after rain, it is generally followed by a settled serenity.

That there are frequently great changes in the air, without any perceptible alteration in the *barometer*.

For the use of BAROMETERS, an ingenious author observes, that by their means we may regain the knowledge which still resides in brutes, and which we forfeited by not continuing in the open air, as they generally do; and by our intemperance, corrupting the crasis of our organs of sense.

As to the predictions from *barometers*, Dr. Halley has found, that the rising of the mercury forebodes fair weather after foul, and an easterly or north-easterly wind.

That the falling thereof portends foully or westerly winds, with rain, or stormy winds, or both.

That, during the time of a storm, the mercury beginning to rise is a pretty sure sign that it begins to abate.

Mr. Patrick observes, that in hot weather, the falling of the mercury prefigures thunder; that when foul weather happens soon after the fall of mercury, it seldom holds long; and, the same is observed, if fair weather succeed presently after its rise.

Lastly, Mr. Derham, from a long series of *barometrical observations* made by Dr. Scheucher, at Zurich, compared with others made at the same times by himself at Upminster, observes, that throughout the whole year the mercury was lower at the former place than at the latter, by sometimes one, and sometimes two inches; though the difference at a medium he computes to be about half an inch; and thence concludes the situation of Zurich to be near $\frac{1}{2}$ of an English mile higher than that of Upminster. He found, however, a considerable harmony between the two; the one usually rising and falling, and that much or little, as the other did; though this harmony is not so exact, as has been observed in *barometers* nearer home, as at London, Paris, in Lancashire, &c.

Cause of the phenomena of the BAROMETER.—These are the chief phenomena of the *barometer*; to account for which, the hypotheses that have been framed are almost infinite. Indeed, as the weight of the atmosphere is generally allowed to be the foundation of the *barometer*, so it is generally granted, that the alterations in the weight of the air, are the occasions of those in the *barometer*; and yet even this does not obtain universally. Dr. Lifter, for instance, accounts for the changes of the *barometer* from the alterations of heat and cold. This, he says, he has often observed, that in storms, &c. when the mercury is at the lowest, it breaks and emits small particles, which he calls a kind of *fretting*; and argues, that in all times of its descent, it is more or less on the fret. In this disorder, he thinks, its parts are contracted and brought closer together, and for that reason descend: besides, in the *fretting* they let go little particles of air, before inclosed in them; and these rising into the top of the tube, the mercury must sink, both from the column's being shortened by their escape, and by their lying upon it. Mercury, therefore, he adds, rises either in very hot or very cold weather, between the tropics, &c. as being then in its natural state; and again, in the intermediate degrees of heat and cold it falls, as being contracted, and as it were convulsed and drawn together.—But this account, however ingenious, yet comes far short of accounting for the phenomena; nay, in some respects, it contradicts them.

The changes in the weight of the atmosphere, therefore, must be laid down as the cause of those in the *barometer*; but then, for the cause of that cause, or whence those alterations arise in the atmosphere, will be no easy matter to determine; there being, perhaps, no one principle in nature that will account for such a variety of appearances, and those too so irregular. It is probable, the winds, as driven this or that way, have a great share in them; some share too vapours, and exhalations rising from the earth, may have; some, the changes in the air of the neighbouring regions; and some, the flux and reflux occasioned in the air by the moon.

Dr. Halley thinks the winds and exhalations sufficient; and on their footing gives us a very probable rationale of the *barometer*: the substance of what may be said on that head is as follows.

1st, Then, the winds must necessarily alter the weight of the air in any particular country; and that, either by bringing together and accumulating a greater quantity of air, and so loading the atmosphere of any place; which will be the case, as often as two winds blow at the same time, from opposite points towards the same point: or, by sweeping away a part of the air, and removing some of the load, and thus giving room for the atmosphere to expand itself; which will be the case, when two winds blow at the same time, and from the same point, opposite ways: or, lastly, by cutting off the perpendicular pressure of the atmosphere; which happens, as often as any single wind blows briskly any way; it being found by experiment,

riment, that a strong blast of wind, even made by art, will render the atmosphere lighter, and accordingly, the mercury, in a tube under which it passes, as well as in another at a distance from it, will subside considerably. See *Phil. Trans.* N° 292.

2dly, The cold nitrous particles, and even air itself condensed in the northern parts, and driven elsewhere, must load the atmosphere, and increase its pressure.

3dly, Heavy, dry exhalations from the earth, must increase the weight of the atmosphere, and heighten its elastic force, as we find the specific gravity of menstruums increased by dissolved salts and metals.

4thly, The air being rendered heavier, from these and the like causes, is thereby the more able to support the vapours; which being likewise intimately mixed with it, and swimming every where equally throughout it, make the weather serene and fair: again, the air being made lighter, from the contrary causes, it becomes unable to support the vapours wherewith it is replete; these therefore precipitating are gathered into clouds, and those in their progress coalesce into drops of rain.

These things observed, it appears pretty evident, that the same causes which increase the weight of the air, and make it more able to support the mercury in the barometer, do likewise occasion a serene sky, and a dry season; and the same causes which render the air lighter, and less able to support the mercury, do likewise generate clouds and rain.

Hence, 1st, When the air is lightest, and the mercury in the barometer is lowest, the clouds are very low, and move swiftly; and when after rain the clouds break, and a calm sky again shines forth, being purged of the vapours, it appears exceedingly bright and transparent, and affords an easy prospect of remote objects.

2dly, When the air is heavier, and the mercury stands higher in the tube, the weather is calm, though somewhat less clear, by reason the vapours are dispersed every where equally; if any clouds now appear, they are very high, and move slowly. And when the air is heaviest of all, the earth is frequently found enveloped in pretty thick clouds, which appear to be formed out of the grosser exhalations, and which the air is then able to sustain, though a lighter atmosphere could not.

3dly, Hence it is, that with us the mercury stands highest in the coldest seasons, and when the wind blows from the north or north-east corner: for in that case there are two winds blowing towards us at the same time, and from opposite corners; there being a constant west wind found in the Atlantic ocean, at the latitude corresponding to ours. To which we may add, that in a north-wind, the cold condensed air of the northern parts is brought hither.

4thly, Hence, in the northern regions, the variation of the mercury is more sensible than in the southern ones; the winds being found both more strong, more frequent, more various, and more opposite to each other in the former than the latter.

Lastly, Hence it is, that, between the tropics, the variation of the mercury is scarce sensible; the winds there being extremely gentle, and usually blowing the same way.

Now, this account, however well adapted to many of the particular cases of the barometer, seems to come short of some of the principal and most obvious ones; and is, besides, liable to several objections.

For, 1st, If the wind were the sole agent in effecting these alterations, we should have no alterations without a sensible wind, nor any wind without some alteration of the mercury; both which are contrary to experience.

2dly, If two winds be supposed blowing from the same place, viz. London, opposite ways, viz. N. E. and S. W. there will be two others, blowing from opposite points, viz. N. W. and S. E. to the same place; which two last will balance the first, and bring as much air towards the point, as the others swept from it. Or thus, in proportion as the air is carried off N. E. and S. W. the adjacent air will crowd in from the other points, and form a couple of new currents in the direction N. W. and S. E. to fill up the vacancy, and restore the equilibrium. This is a necessary consequence from the laws of fluids.

3dly, If the wind were the sole agent, the alterations in the height of the mercury would only be relative or topical; there would be still the same quantity supported at several places taken collectively: thus what a tube at London lost, another at Paris, or at Pisa, or at Zurich, &c. would at the same time gain. But, we find the very contrary true in fact; for, from all the observations hitherto made, the barometers in several parts of the globe rise and fall together; so that it must be some alteration in the absolute weight of the atmosphere, that accounts for the rise and fall of the mercury.

Lastly, Setting aside all objections, these popular phenomena, the mercury's fall before, and rise after rain, seem to be inexplicable on the foot of this hypothesis: for, suppose two contrary winds sweeping the air from over London: we know that few, if any, of the winds reach above a mile high; all therefore they can do will be, to cut off a certain part of the

column of air over London: if the consequence of this be the fall of the mercury, yet there is no apparent reason for the rains following it. The vapours indeed, may be let lower, but it will only be till they come into an air of the same specific gravity with themselves; and there they will stick as before.

M. Leibnitz endeavours to supply the defects of this hypothesis with a new one of his own. He asserts, that a body immersed in a fluid only weighs with that fluid while it is sustained thereby; so that when it ceases to be sustained, i. e. when let fall, its weight ceases to make a part of that of the fluid; which by this means becomes lighter. Thus, adds he, the watery vapours, while sustained in the air, increase its weight; but when let fall, they cease to weigh along with it. Thus the weight of the air is diminished; and thus the mercury falls, and rain ensues.

But M. Leibnitz's principle, notwithstanding the experiment he brings to confirm it, is false, as has been evidently made appear by a counter-experiment of Dr. Defaguliers. For, a body, whether specifically equal, or lighter, or heavier than a fluid, while it is immersed in it, whether it be at rest or in motion, adds to the fluid a weight equivalent to that of an equal bulk of the fluid; as follows from that law in hydrostatics. That fluids gravitate according to their perpendicular altitudes.—However, were Mr. Leibnitz's principle true, yet it is defective; and that in the same respect with Dr. Halley's: nor would it account for the phenomena more than the other.

For, supposing the vapours, by being condensed, to be put in a motion downwards, and so ceasing to gravitate with the atmosphere; they will therefore fall, till they reach a part of the atmosphere of the same specific gravity with themselves; and there they will hang as before. If the mercury fall, it will only be during the time of that descent; for these once fixed, the former gravity is retrieved; or, were it not retrieved, yet no rain would ensue the fall of the mercury.

If it might be allowed us to add any thing after such great men, it should be as follows.—Suppose any number of watery vesicles floating in any part of the atmosphere, over any determinate portion of the globe; for instance, over AB, fig. 21. If the upper vesicles be condensed by the cold of the superior regions, their specific gravity will be increased, and they will descend; the horizontal class 1, v. gr. to 2, 2 to 3, &c. where meeting with other vesicles not yet precipitated, they will coalesce, or run into larger vesicles, by the known laws of attraction. Or, if we rather chuse to have the wind act; let it drive either horizontally, or obliquely: in the former case, the vesicles, class 8, will be given against 9; those against 10, &c. or the oblique class A 7, driven against 5, 8 against 4, &c. By which means likewise will the particles coalesce, and form new and larger vesicles, as before; so that their number, which before was, suppose a million, will now be reduced, v. gr. to a hundred thousand.

But by the same coalition whereby their number is diminished, their specific gravity, if we may so call it, is increased, i. e. they come to have more matter in the same space, or under an equal surface; as may be easily proved from principles of geometry: for in augmenting the mass of any homogeneous body, the increase of surface does not keep pace with that of the solidity; but that of the former, is as the square of the diameter; and that of the latter, as the cube of the same.

But since the same quantity of matter is now in a less space, or under less dimensions, it will lose less of its weight by the resistance of the medium. This is evident; for a body immersed in a fluid, loses nothing of its weight but by the friction of its parts against those of the fluid; but the friction is evidently as the surface; therefore, where the surface is lessened, the resistance must be so too. Consequently, the vesicles, whose gravity before the coalition was equal to the resistance of the medium, now that resistance is diminished, will descend; and that with a velocity, in the ratio of the increase of the mass to the increase of the surface.

In their descent, as they arrive at denser parts of the atmosphere, v. gr. at 4, 5, &c. their mass and surface again will be increased by new coalitions; and thus, by constant fresh accessions, more than equal to the constant resistances, they will be enabled to pursue their journey through all the stages of the air, till they reach the earth; their masses exceedingly magnified; and in the form of rain.

Now that the vapours are got down, let us consider how the barometer must have been affected during their passage. Before any of the vesicles began to subside, either from the action of the cold, or of the wind, they all floated in the portion of the atmosphere ABCD, and all gravitated towards the centre E. Here now, each respectively residing in a part of the medium of the same specific gravity with itself, will lose as much of its weight, as is equal to that of a part of the medium of the same bulk with itself, i. e. each will lose all its weight. But then, whatever weight each loses, it communicates to the medium, which now presses on the surface of the earth AB, with its own weight, and that of the vesicles conjointly. Suppose then this united pressure keeps up the mercury in the barometer at thirty inches: By the coalition of the vesicles from the causes aforesaid, their surfaces, and consequently their friction is lessened: therefore they will communicate less

less of their weight to the air, *i. e.* less than the whole; and consequently they will descend with the excess, *i. e.* with a velocity equal to the remainder, as before observed. Now, as the vessels can act no otherwise on the surface of the earth A B, but by the mediation of the interjacent air; in proportion as their action on the medium is less, their action on the earth will be less. It is also evident, that the surface of the earth A B, must be now less pressed than before: and that in proportion, as the vessels reserve more of their weight uncommunicated to the medium, to promote their own descent, *i. e.* in proportion to the velocity of the falling vessels; which is, again, in proportion to their bulks. Thus, as the vessels descend, the bulks continually increasing, the friction, and therefore the pressure on the earth, and lastly, the height of the mercury will continually decrease, during the whole time of the fall.—Hence we see, both why the vessels, when once beginning to fall, persevere; why the mercury begins to fall at the same time; and why it continues and ceases to fall together with them: which were the great desiderata in the philosophy of the *barometer*.

I see but one objection that lies against this theory; and it is this, that the vessels being put in motion, and striking against the particles of the medium and one another with some moment, will meet with a considerable resistance from the *vis inertia* thereof; by which means their descent will be retarded, and the pressure of the atmosphere retrieved; the impetus of the moving vessels being supposed to compensate for their loss of surface. Thus a heavy body sustained in a fluid by a hair, and moved up and down therein, presses more on the bottom, than when held at rest; which additional pressure will be the greater, as the velocity of the falling vessels is greater; a greater impulse being required to break through the *vis inertia* of the contiguous particles, in a less time than in a larger.

But, we have both reason and experiment against this objection: for, besides that the velocity of the vessels, in these circumstances, must necessarily be very small, and their impulse inconsiderable; besides, that the *vis inertia* of the air must be exceedingly weak, by reason of its extreme subtilty; and that it must be a very improper vehicle to convey an impulse to a distance, by reason of its elasticity: we find, that even in water, (a gross un-elastic medium) and a piece of lead, (a ponderous body, which falls with a great moment) that even here the body, in its descent through the fluid, gravitates considerably less than when sustained at rest therein: in which the several experiments of Reaumur, Ramazzini, and Defaguliers, all agree.

BAROMETRICAL Phosphorus. See PHOSPHORUS.

BARON *, a dignitary who holds a barony.

* *Baron* is a term whose origin and primary import is much contested; some will have it originally denote a *man, arm; some a hero, or valiant man; some a libertinus or freeman; some a great or rich man; some a vassal or liegeman.*—Menage derives it from the Latin *baro*, which we find used in the pure age of that language for *vir*, a stout, or valiant man: whence, according to this author, it was, that those placed next the king in battles were called *barones*, as being the bravest men in the army: and as princes frequently rewarded the bravery and fidelity of those about them with fees, the word came to be used for any noble person who holds a fee immediately of the king.—Isidore, and after him Camden, take the word in its original sense to signify, a *mercenary soldier*. Messieurs of the Port Royal derive it from *bas*, weight, or authority. Cicero uses the word *baro* for a stupid, brutal man; and the old Germans make mention of, *buffing a baron*, *i. e.* a villain; as the Italians still use the word *barone*, to signify a *beggars*.—M. de Marca derives *baron* from the German *bar*, man, or freeman: others derive it from the old Gaulish, Celtic, and Hebrew languages: but the most probable opinion is, that it comes from the Spanish *baro*, a stout, noble person; whence wives come to call their husbands, and princes their tenants, *barons*. In the Salsic laws, as well as the laws of the Lombards, the word *baron* signifies a *man in the general*; and the old Glossary of Philomenes translates *baron* by *army, man*.

BARON is more particularly used among us for a lord, or peer of the lowest class; or a degree of nobility next below that of a viscount, and above that of a knight, or a baronet.

Barons are lords of parliament, and peers of the realm, and enjoy all the privileges thereof.—They are not girt with a sword at their creation, nor had they any coronets till the reign of King Charles II. who gave them a circle of gold with six pearls set close to the rim.

In ancient records, the word *barons* included all the nobility of England, because regularly all noblemen were *barons*, tho' they had also a higher dignity.—And therefore the charter of king Edward I. which is an explication of what relates to *barons* in Magna Charta, concludes, *testibus archiepiscopis, episcopis, baronibus, &c.* And the great council of the nobility, when they consisted of, besides earls and *barons*, dukes, marquises, &c. were comprehended under the name of *la conseil de baronage*.

BARONS by ancient tenure were those who held certain territories of the king, who still reserved, the tenure in chief to himself. We also read of *barons by temporal tenure*; who are such

as hold honours, castles, manors, as heads of their *barony*, that is, by grand fealty; by which tenure they were anciently summoned to parliament. But at present a *baron* by tenure is no lord of parliament, till he be called thither by writ.

The *barons* by tenure, after the conquest, were divided into *maiores*, and *minores*, and were summoned accordingly to parliament; the *maiores*, or greater *barons*, by immediate writ from the king; the *minores*, or lesser *barons*, by general writ from the high sheriff, at the king's command.

The ancients distinguished the greater *barons* from the less, by attributing high, and even sovereign jurisdiction to the former, and only inferior jurisdiction over smaller matters to the latter.

BARONS of the exchequer are judges, four in number, to whom the administration of justice is committed in causes between the king and his subjects, touching matters belonging to the exchequer, and the king's revenue.

They are called *barons*, because *barons* of the realm were used to be employed in that office.

Their office is also to look to the accompts of the king; to which end they have auditors under them; as well as to decide causes relating to the revenue, brought by any means into the exchequer. So that of late they have been constantly persons learned in the law; whereas formerly they were *maiores & discretiores in regno, sive de clero essent, sive de curia.*

BARONS of the cinque-ports, are members of the house of commons elected by the five ports, two for each port.

Those who have been mayors of Corfe-castle in Dorsetshire, are also denominated *barons*.—As were formerly, likewise, the chief citizens of London.

BARON is also used for the husband, in relation to the wife; which two in law are called *baron and feme*. See HUSBAND and WIFE.

BARON and feme, in heraldry, is when the coats of arms of a man and his wife are borne per pale in the same escutcheon; the man's being always on the dexter side, and the woman's on the sinister.—But here the wife is supposed not an heiress; for then her coat must be borne by the husband on an inescutcheon, or escutcheon of pretence.

Court-BARON. } See the articles } COURT.
Prender de BARON. } Prender.

BARONET, among modern writers, denotes a dignity, or degree of honour next beneath a baron, and above a knight; having precedency of all knights, excepting those of the garter.

The dignity of *baronet* is given by patent, and is the lowest degree of honour that is hereditary. The order was founded by king James I. in 1611, when 200 baronets were created at once; to which number, by the patent, they were always to be restrained. Though, it is said, there are now four times that number.

They had several considerable privileges given them, with an habendum to them and their heirs male. They were allowed to charge their coat with the arms of Ulster, which are, in a field argent a hand gules; and that upon condition of their defending the province of Ulster, in Ireland, against the rebels, who then harassed it extremely; to which end, they were each to raise and keep up thirty soldiers, at their own expence, for three years together; or to pay into the exchequer a sum sufficient to do it; which at 8*d.* per day per head, was 1095*l.* now always remitted them.

Baronets take place according to the dates of their patents; by the terms of which, no honour is to be erected between *barons* and *baronets*.

The title *Sir* is granted them by a peculiar clause in their patents, though they be not dubbed knights.—But both a *baronet*, and his eldest son being of full age, may claim knighthood.

BARONIE Caput. See the article CAPUT.

BARONY, BARONIA, or BARONAGIUM, the lordship, or fee of a baron, either temporal or spiritual. See BARON. In which sense *barony* amounts to the same with what is otherwise called *honour*.

A *barony* may be considered as a lordship held by some service in chief of the king *, coinciding with what is otherwise called *grand sergeanty*.

* *Baronia*, in their first creation, moved from the king himself, the chief lord of the whole realm: and could be holden immediately of no other lord: for example; The king enfeoffed a man of a great seignury in land; to hold to the person enfeoffed and his heirs, of the king and his heirs, by baronial service, to wit, by the service of twenty, forty, sixty knights, or of such other number of knights, either more or fewer, as the king by his enfeoffment limited or appointed.—In the ages next after the conquest, when a great lord was enfeoffed by the king of a large seignurie, such seignurie was called a *barony*; but more commonly, an *honour*; as, the *honour* of Gloucester, the *honour* of Walsingham, the *honour* of Lancaster, the *honour* of Richmond, and the like. There were in England certain *honours* which were often called by Norman or other foreign names, that is to say, sometimes by the English, and sometimes by the foreign name. This happened when the same person was lord of an *honour* in Normandy, or some other foreign country, and also of an *honour* in England. For example: William de Forz, De Force, or De Fortibus, was lord of the *honour* of Albemarle in Normandy,

Normandy. He was also lord of two honours in England, to wit, the honour of Holderness, and the honour of Skipton in Craven. These honours in England were sometimes called by the Norman name, the honour of Albemarle, or the honour of the earl of Albemarle. In like manner, the earl of Britannie was lord of the honour of Britannie in France, and also of the honour of Richmond in England. The honour of Richmond was sometimes called by the foreign name, the honour of Britannie, or the honour of the earl of Britannie. This serveth to explain the terms, honour of Albemarle in England, honour Albemarle, or Comitatus Albemarle in Anglia; honor Britannie, or Comitatus Britannie in Anglia, the honour of Britannie, or of the earl of Britannie in England. Not that Albemarle or Britannie were in England; but that the same person respectively was lord of each of the said honours abroad, and each of the said honours in England. See *Madox, Hist. of Land hon. and baronies*.

The baronies belonging to bishops are, by some, called *regalia*, as being held solely on the king's liberality. These do not consist in one barony alone, but in many; for, *tot erant baronia, quot majora prædia*.

A barony, according to Bracton, is a right indivisible: wherefore, if an inheritance be to be divided among coparceners, though some capital messuages may be divided, yet, if the capital messuage be the head of a county, or barony, it may not be parcelled; and the reason is, left by this division, many of the rights of counties and baronies, by degrees, come to nothing, to the prejudice of the realm; which is said to be compoised of counties and baronies.

BAROSCOPE *, a machine contrived to shew the alterations in the weight of the atmosphere. See **BAROMETER**.
* The word is derived from *βαρὺς*, *onus*, and *σκοπεῖν*, *videre*.

BARR. See the article **BAR**.

BARRATOR *, in law, a common mover, or maintainer of suits, quarrels, or parties, either in courts or elsewhere.

* The word is also written, *barator*, *barretor*, and *barretour*. Lambert derives it from the Latin *barathro*, or *balatro*, a vile knave or unthrif. Skene from the Italian *barattaria*, corruption, or bribery in a judge. Menage from the French *barattor*, of the old word *barat*, a trick.

BARRATRY, in a marine sense, is the master of a ship's cheating the owners or insurers, whether it be done by running away with the ship, sinking her, deserting her, or embezzeling the cargo.

BARRE. See the article **BAR**.

Port de BARRE. See the article **PORT**.

BARREL, an oblong vessel, of a spheroidal, or rather a cylindrical figure, used for the holding divers sorts of goods, both liquid and dry.

The English barrel, wine measure, contains the eighth part of a tun, the fourth part of a pipe, and the moiety of a hoghead, that is, thirty-one gallons and a half; of beer it contains thirty-six gallons; and of ale thirty-two gallons.

The barrel of beer, vinegar, or liquor preparing for vinegar, is to contain 34 gallons, according to the standard of the ale quart. 10 *Ed. III. c. 21*.

The barrel or barrille of Florence is a liquid measure containing twenty fasks, flasks, or one third of a star or stajo.—The barrel, barique of Paris, contains two hundred and ten pints, or twenty-six septiers and an half; four bariques make three muids, or one tun.—The barrel is half a pipe.

BARREL is also used for a certain quantity, or weight, of several merchandizes; which is various as the commodities vary.

The barrel of herrings is to contain 32 gallons, wine measure; being about 28 gallons old standard: usually amounting to about 1000 full herrings. 13 *Ed. c. 11*.
The barrel of falcon is to contain 42 gallons. 5 *G. c. 18*.—And the barrel of eels, the same. 22 *Ed. 4. c. 2*.

The barrel of soap, is to contain 256 pounds. 10 *A. c. 19*.

BARREL, in anatomy, denotes a pretty large cavity situated behind the drum of the ear, lined with a membrane, in which there are several veins and arteries. It is said to be full of a purulent matter in children; and in its cavity there are four small bones; viz. the malleolus, the incus, the stapes, and the os orbiculare. See **EAR**.

BARRENESS. See the article **STERILITY**.

BARRICADE, or **BARRICADO**, a military term for a fence, or retrenchment, hastily made with vessels or baskets of earth, carts, trees, palisades, or the like, to preserve an army from the enemy's shot, or assault. See **DEFENCE**.
The most usual matter of *barricades* is pale, or stick, which are crossed with battoons, and shod with iron at the feet: usually set up in passages, or breaches, to keep back as well the horse as foot.

BARRIER, a kind of fence made at a passage, retrenchment, gate, &c. to stop up the entry thereof. See **DEFENCE**.
It is usually made of great stakes, about four or five foot high, placed at the distance of eight or ten foot from one another, with overthwart rafters; serving to stop either horse or foot that would rush in.—In the middle is a moveable bar of wood, which opens and shuts at pleasure.

BARRIERS, has been likewise used to signify a martial exercise of men, armed and fighting together with short swords, without.

in certain rails or bars, whereby they were inclosed from the spectators.

BARRISTER *, a person qualified and impowered to plead and defend the causes of clients, in the courts of justice.

* The word is formed from *bar*, *barra*, a name given the place where they stand to plead.

Barriers, in the English law, amount to the same with *licentiates*, and *advocates* in other countries and courts, where the civil, &c. laws obtain.

Anciently they were denominated among us, *apprentices of the law*, *apprentici juris*; now usually, *counsellors at law*.

To pass *barriers* they were formerly obliged to study eight years, now only seven, and sometimes fewer. The exercise required was 12 grand moots performed in the inns of chancery in time of the grand readings, and 24 petty moots at the inns of chancery in term-time, before the readers of the respective inns of chancery.

Utter barriers, according to some, are pleaders without the bar; they are thus called to distinguish them from benchers, or those who have been readers, who are admitted to plead within the bar; hence called *inner barriers*. 5 *El. c. 1*.

BARRULET, in heraldry, is the half of the cfofet, or the quarter of the bar.

BARRY, in heraldry.—When an escutcheon is divided barways into an even number of partitions, and consists of two or more tinctures interchangeably disposed, it is expressed in blazon by the word *barry*, and the number of pieces is to be specified.—e. gr. *Barry of 10 many pieces*.

If the divisions be odd, the field must be first named, and the number of bars expressed.

BARRY-BENDY is when an escutcheon is divided evenly both bar and bend-ways, by lines drawn transverse and diagonal, interchangeably varying the tinctures of which it consists.—Thus, he bears *barry-bendy, or and sable*.—See *Tab. Herald. fig. 4*.

BARRY-PILY, is when a coat is divided as represented in *Tab. Herald. fig. 5*, which is blazoned, *barry-pily* of eight pieces.

Counter-BARRY. See the article **COUNTER**.

BARTERING *, the act of trucking or exchanging one commodity for another of like value. See **EXCHANGE**.

* The word comes from the Spanish *baratar*, to deceive or circumvent in bargaining; perhaps because those who deal this way usually endeavour to over-reach one another.

This is also called *bartry*, 13 *Eliz. c. 7*.

BARTHOLOMEW, *Hospital*. See **HOSPITAL**.

BARTON, in Devonshire, and the West of England, is used for the demesne-lands of a manor.—Also for the manor-house.—And in some places, for out-houses, fold-yards, &c.

BAS-Relief. See the article **BASSO-Relievo**.

BASALTES *, *Βασαλτης*, a kind of stone, described by the ancient naturalists, as of the hardness and colour of iron.

* Pliny, and others after him, write the word *basaltis*; *Sal-mastius* corrects it, *basaltis*, *Βασαλτης*, *λιδος*.

The largest block of this stone that ever was seen, Pliny says, was placed by Vespasian in the temple of Peace: in it were represented the figure of Nilus, with 16 children playing about her, denoting so many cubits of its life: He adds, that the statue of Memnon, in the temple of Serapis, at Thebes, which rebounded at the rising of the sun, was also made of this stone. How this miraculous kind of resonance was caused seems indicated by Juvenal, *Sat. 15. v. 5*.

—*Dimidio magice resonant ubi Memnone chordæ*—

Most of the antique Egyptian figures remaining are also apparently of the same stone.

Some of the ancients call it *lapis Lydius*, from Lydia, the place where it was found in most abundance; and among the moderns it is denominated the *touch-stone*, as being used for the trial of gold and silver.

It is hard, heavy, close, black, and resists the file; and had its name from *basal*, iron; or *Βασαλτης*, *diligenter examina*.—Delechampius says, there are stones of the same kind near Gaillon in Normandy; others are brought from Ethiopia and Germany.—The giants causeway in Ireland is composed of the *basaltis*. See **SUPPLEMENT**, article **BASALTES**.

BASE, **BASIS**, in architecture, denotes the lower part of a column or pedestal.

The *base* is sometimes also called *spira*, from *spira*, the folds of a serpent laid at rest, which make a figure not unlike it.—See *Tab. Archit. fig. 24. lit. 2. fig. 26, 28, 30, 32*.

BASE of a Column is that part between the shaft and the pedestal, if there be any pedestal; or, if there be none, between the shaft and the plinth, or zocle.

The *base* is supposed to be the foot of the column; or, as some will have it, it is that to a column which a shoe is to a man.—The members or ornaments whereof it is composed are supposed by some to have been originally intended to represent the iron circles wherewith the feet of trees and posts which supported the ancient houses were girt, in order to strengthen them.

The *base* is different in the different orders.—The *Tuscan Base* is the most simple of all others; consisting only of a single tore besides the plinth.—See *Tab. Archit. fig. 24. lit. 2*.

Doric BASE has an astragal more than the Tuscan; though that was introduced by the moderns. See fig. 28.

Ionic BASE has a large tore over two slender scotias, separated by two astragals; though in the most ancient monuments of this order there are no *bases* at all; which the architects are at a loss to account for. See fig. 32.

Corinthian BASE has two tores, two scotias, and a fillet.—See fig. 26.

Composite BASE has an astragal less than the Corinthian. See fig. 30.

Attic, or Atticurgic BASE, so called, because first used by the Athenians, has two tores and a scotia.

BASE, in fortification, denotes the external side of the polygon; or, that imaginary line which is drawn from the flanked angle of a bastion to that which is opposite thereto.

Line of the Base. See the article **LINE**.

BASE of a figure, in geometry, denotes the lowest parts of its perimeter.

In which sense, the *base* stands opposed to the *vertex*, which denotes the highest part.

BASE of a triangle: any side thereof is occasionally so called; though properly it is the lowest side, or that which lies parallel to the horizon.

Thus, the line AB is the *base* of the triangle ABC, *Tab. Geom. fig. 68*. Not, but on other occasions, the lines AC, or BC in the triangle, may be made the *base*.

In a rectangled triangle, the *base* is properly that side opposite to the right angle, i. e. the hypotenuse.

BASE of a solid figure is its lowest side, or that whereon it stands.

Thus the plane DFE, is the *base* of the cylinder ABDE.—*Tab. Geom. fig. 56*.

BASE of a conic section is a right line in the hyperbola and parabola, formed by the common intersection of the secant plane, and the *base* of the cone.

Altern BASE. See the article **ALTERN**.

Distinct BASE, in optics. See **DISTINCT**.

BASE of the heart, in anatomy, denotes the broader or upper part of that viscus, to the sides of which the two auricles are affixed.—See *Tab. Anat. (Splanchn.) fig. 12. litt. aa, and cc*.

This is sometimes also called the *vertex* or head, *κεφαλη*; in opposition to which, is the lesser or narrower part, called *apex*, or *mucro*, the point or tip of the heart.

Some also give the denomination *base*, to the root of the os hyoides.

BASE, in music. See the article **BASS**.

BASE, in a law sense.—*Base estate* is that estate which base tenants have in their lands.

BASE Fee denotes a tenure in fee at the will of the lord. By which it stands distinguished from *focage* or *free tenure*. See **FE**.

BASE Court is any court not of record.—Such, *e. gr.* is the court-baron. See **COURT**.

BASE Tenure, *Bassa Tenura*, denotes holding by villenage, or other customary service; as distinguished from the higher tenures in capite, or by military service.

BASE Point in heraldry. See **POINT** and **ESCUTCHEON**.

BASE Ring of a cannon is the great ring next behind the touch-hole.

BASHAW, *PASCHA*, or *PACHA*, a Turkish governor of a province, city, or other district.

We say, the *bashaw* of Babylon, the *bashaw* of Anatolia, the *bashaw* of Bender, &c.

BASHAWS include *Beglerbegs*, and sometimes *Sangiacbegs*: though a distinction is sometimes made, and the name *bashaw* is appropriated to the middle fort, or such as have two ensigns or horse-tails carried before them.—Those who have the honour of three tails, are called *Beglerbegs*; and those who have only one, *Sangiacbegs*.

The appellation *Pascha* is also given by way of courtesy at Constantinople, to the lords about the Grand Signor's court, the officers in the army, and almost every person of any figure.

Captain BASHAW is the title of the Turkish high admiral.

BASIA Ultima. See the article **ULTIMA**.

BASIL, among joiners, denotes the angle to which the edge of an iron tool is ground.

To work on soft wood they usually make their *basil* 12 degrees, for hard wood 18; it being observed, that the more acute or thin the *basil* is, the better and smoother it cuts; and the more obtuse, the stronger and fitter it is for service.

Order of St. BASIL is the most ancient of all the religious orders; it takes its name from St. Basil, bishop of Cæsarea, in Cappadocia, about the middle of the fourth century; who is supposed to have been the author of the rule observed by this order, though some dispute it.—The order of St. Basil was anciently very famous in the east.

BASILARE Or. See the article **SPHENOIDES**.

BASILIC, or **BASILICA**, in the ancient architecture, denotes a kind of public hall or court of judicature,

where the princes or magistrates sat to administer justice.

* The word is originally Greek, *Βασιλικη*, *q. d.* royal house, or palace.

In after-times the denomination *basilica* was also given to other buildings of public use, as town-houses, exchanges, burles, and the like.

BASILIC, BASILICA, is also used in ecclesiastical writers, for a church.

In which sense, this name frequently occurs in St. Ambrose, St. Austin, St. Jerom, Sidonius Apollinaris, and other writers of the fourth and fifth century.

M. Perrault says, that *basilics* differed from *temples*, in that the columns of temples were without-side, and those of *basilics* within.

BASILICA, or **BASILICUS**, in anatomy, the name of a vein, arising from the axillary branch, and running the whole length of the arm. See *Tab. Anat. (Angiol.) fig. 6. lit. o*.

The *basilica* is one of the veins used in bleeding in the arm.

BASILICS, BASILICA, a collection of the Roman laws, translated into Greek by order of the emperors Basil and Leo, and which were of force in the Eastern empire till its dissolution.

The *basilics* comprehend the institutes, digests, code, and novels, and some edicts of Justinian, and other emperors. The collection consisted of 60 books, for which reason it was called *ἐκκελευστικὰ βιβλία*. It is supposed to be chiefly the work of the emperor Leo the philosopher, who denominated it from his father Basilus Macedo, who first began it.—Of the 60 books there are now remaining only 41; the other 19 are, in some measure, supplied by Fabrotus, from the *synopsis basilicon*, &c.

BASILICI, ΒΑΣΙΛΙΚΟΙ, in the Greek empire, was a denomination given to the prince's mandararies, or those who carried his orders and commands.

BASILICON, or BASILICUM, in pharmacy, is the denomination of an official unguent or plaster; called also *tertraparmacum*, as being composed of four simples, *viz.* rosin, wax, pitch, and oil olives.

BASILICUS, or BASILICA, in astronomy, is the name of a fixed star of the first magnitude, in the constellation Leo; called also *regulus*, and *cor leonis*.

BASILIDIANS, ancient heretics, the followers of Basilides, an Egyptian, who lived near the beginning of the second century.

He was educated in the Gnostic school, over which Simon Magus presided; with whom he agreed, that Christ was only a man in appearance, that his body was a phantom, and, that he gave his form to Simon the Cyrenian, who was crucified in his stead.

We learn from Eusebius, that this heresiarch wrote 24 books upon the gospels, and that he forged several prophets; to two of which he gave the names Barcaba, and Barcoph. We have still the fragment of a Basilidian gospel.

His disciples supposed there were particular virtues in names, and taught, with Pythagoras and Plato, that names were not formed by chance, but naturally signified something.—Basilides, to imitate Pythagoras, made his disciples keep silence for five years.

BASIOGLOSSUM*, or rather **BASIGLOSSUM**, in anatomy, a pair of muscles, which arise fleshy from the basis of the os hyoides, and are inserted into the root of the tongue: serving to draw the tongue towards the bottom of the mouth.

* The word comes from the Greek, *βασις*, foundation; and *γλῶσσα*, a tongue.

BASIS, or BASE. See the article **BASE**.

BASON, pelvis, in anatomy, a round cavity in form of a tunnel, situate between the anterior ventricles of the brain, descending from its base, and ending in a point at the glandula pituitaria.

It is formed of the pia mater, and receives the pituita which comes from the brain, and passes through the pituitary gland, and from thence into the veins.

That capacity also is called *pelvis*, or *bason*, which is formed by the ossa ilia and sacrum, and contains the bladder of urine, the matrix, and the intestines.

BASONS of a Balance, two pieces of brass, or other matter, fastened to the extremities of the fringes; the one to hold the weight, the other the thing to be weighed.

BASON, or Dish, among glass-grinders.—These artificers use various kinds of *basons*, of copper, iron, &c. and of various forms, some deeper, others shallower, according to the focus of the glasses that are to be ground. In these *basons* it is, that convex glasses are formed, as concave ones are formed on spheres or bowls.

Glasses are worked in *basons* two ways.—In the first, the *bason* is fitted to the arbor, or tree of a lathe, and the glass (fixed with cement to a handle of wood) presented and held fast in the

the right hand within the *bafon*, while the proper motion is given by the foot to the *bafon*.—In the other, the *bafon* is fixed to a stand or block, and the glafs with its wooden handle moved.

The moveable *bafons* are very small, feldom exceeding five or fix inches in diameter; the others are larger, fometimes above ten foot diameter.

After the glafs has been ground in the *bafon*, it is brought fmoother with greafe and emery; and polished firft with tripoli, and fnifhed with paper cemented to the bottom of the *bafon*.

BASON, among hatters, is a large, round fhell, or cafe, ordinarily of iron, placed over a furnace; wherein the matter of the hat is moulded into form.

The hatters have alfo *bafons* for the brims of hats, ufually of lead, having an aperture in the middle, of a diameter fufficient for the largeft block to go through. See **HAT**.

BASON is alfo ufed on various occasions for a fmall refervatory of water: as the *bafon* of a jet d'eau, or fountain; the *bafon* of a port, of a bath, &c. which laft Vitruvius calls *labrum*. See **FOUNTAIN**.

BASON is likewife ufed for a dock. See **DOCK**.

BASS*, in mufic, that part of a concert which is the moft heard, which confifts of the *gravest*, deepeft and longeft founds; or which is played on the largeft pipes or ftrings of a common inftrument, or on inftruments larger than ordinary, for the purpofe.

* It is called *bafs*, from the Italian *baffo*, of the Latin *bafis*, as being the foundation of the harmony.

Muficians hold the *bafs* the principal part of a concert, and the foundation of the compofition: though fome will have the *treble* the chief part; which others only make a circumftance, or ornament.

Counter-Bass, is a fecond *bafs*, where there are feveral in the fame concert.

Thorough-Bass, is that which proceeds, without interruption, from the beginning of a mufical compofition to the end.—

By which it ftands contradiftinguifhed from the *finging bafs*, and the *baffes of violins*, which make pauses from time to time.

The *thorough bafs* is the harmony made by *bafs* viols, theorbo's, or the like, continuing to play, both while the voices fing, and the other inftruments perform their part; and alfo filling the intervals when any of thofe flop.

M. Broffard obferves, the *thorough bafs* to be a part of the modern mufic; firft invented in 1600, by an Italian, called Ludovico Viadana.

It is commonly diftinguifhed from the other *baffes* by figures over the notes; which figures are proper only for the organ, harpifcord, fpinet, and theorbo lute.—But it is to be obferved a *thorough bafs* is not always figured, though it ought to be fo.

BASSON, or **BASSOON**, a mufical inftrument of the wind kind, blown with a reed, and furnifhed with eleven holes; ferving for the *bafs* in concerts of hautboys, &c.

To make it more portable, it divides into two parts, whence it alfo bears the denomination *fagot*. Its diameter at bottom is nine inches, and its holes are ftopped, like thofe of large flutes.—A good *baffoon* is faid to be worth four or five hundred piſtoles.

BASSO rilievo, or **BAS relief**, a piece of fculpture, the figures whereof do not project far, or ftand out from the ground with their full proportion.

M. Felbien diftinguifhes three kinds of *reliefs*; in the firft, the front figures appear almoft with their full *relievo*, called *alto rilievo*; in the fecond, they do but ftand out one half, called *mezzo rilievo*; and in the third, much lefs, which is the proper *baffo rilievo*, as in coins, vaffes, &c. See **RELIEVO**.

BASSO & alto, in law. See the article **ALTO**.

BASS-VIOL, a mufical inftrument of the fame form with that of the violin, except that it is much larger.—It is ftruck like that, with a bow; and has ftrings, and eight ftops, divided by half ftops, or femi-tones.

The found it yields is much more grave, fweet, and agreeable than that of the violin, and of a much nobler effect in a concert. See **VIOLIN**.

BASTARD, a natural child, or one born out of lawful wedlock.

A *bastard* differs from one born in adultery, or inceft, in that the parents of the former are free, or allowed to marry, which thofe of the latter are not.

The *bastards*, or natural fons of a king in France, are princes when owned; thofe of a prince, or nobleman, are gentlemen; but thofe of a gentleman are only plebeians, and pay taxes accordingly.

By the French laws, *bastards* cannot inherit before they are legitimated; nor have heirs, except their own children begot in wedlock: for want of thefe, their inheritance devolves on the king.

By the Roman law, the mother inherited from her *bastard* child, and *vice verfa*: but there was a great difference between *bastards*, *nothi*, and thofe they called *ſpurious*. The law did not own the latter, nor allow them fuffenance, becaufe they were born in common and uncertain proftitution. *Is non habet patrem, cui pater eſt populus*. The former fort, born

in concubinage, which reſembles marriage, inherited from their mothers, and had a right to demand fuffenance of their natural fathers. They were looked upon as domeſtic creditors, that ought to be treated the more favourably, for being the innocent product of their parents crimes. Solon would have it, that the parents ſhould be deprived of their paternal authority over their *bastards*, becauſe, as they were only parents for pleaſure, that ought to be their only reward.

Anciently, in Rome, natural children were quite excluded from inheriting after their fathers *ab inteſtato*: but they might be appointed heirs in general. The emperor Arcadius and Honorius made a reſtriction, that when there were legitimate children, the *bastards* ſhould only come in for a twelfth, to be ſhared with their mother. Juſtinian afterwards ordered, that they might come in for half; and ſucceed *ab inteſtat*. for a fixth, when there were legitimates.

Bastards might be legitimated by ſubſequent marriage, or by the emperor's letters. Only the king in France, and the king and parliament in England, can give *bastards* a right of legitimacy, and a power to inherit. The emperor Anaſtaſius allowed fathers to legitimate their *bastards* by adoption alone: but this was aboliſhed by Juſtin and Juſtinian, let by this indulgence they ſhould authorize concubinage. The pope has ſometimes legitimated *bastards*. Nay, the holy ſee has on ſome occasions diſpenſed, not only with legitimates, but with the offspring of adulterers, as to ſpiritual confiderations, in allowing of their promotion to epifcopy.

Bastards not legitimated may diſpoſe of their goods by donation when alive, or by will afterwards. Thoſe legitimated by ſubſequent marriage are in the ſame ſtate, and enjoy the ſame right with thoſe born in wedlock: but, thoſe who are legitimated by the king's letters, are not eſteemed legitimate, capable of inheriting, but with regard to ſuch of their parents as have conſented to their legitimation. Pope Clement VII. by his bull, forbade a prieſt to reſign his benefice to his *bastard*.

A *bastard's* arms ſhould be croſſed with a bar, fillet, or tranſverſe from the left to the right. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themſelves; and this is ſtill done by the natural fons of a king.

Bastards cannot be admitted to ſimple benefices, or the loweſt orders, or to more than a ſimple benefice, without orders from the pope: nor are they allowed to bear office without the prince's letters.

A *bastard*, by the law of England, cannot inherit land as heir to his father; nor can any perſon inherit land as heir to him, but one that is heir of his body. If a child be begotten by him who doth marry the woman after the child's birth, yet it is in judgment of the law a *bastard*, though the church holds it legitimate.—If one marry a woman and die before night, and never bed her, and ſhe have a child after, it is yet accounted his child, and legitimate.—If a man or woman marry again, and have iſſue by the ſecond wife or husband, whiſt the firſt is living, ſuch iſſue is a *bastard*. If a woman elope with a ſtranger, and have a child by him, her husband being within the four years, this is legitimate, and ſhall inherit the husband's lands.—He that gets a *bastard* in the hundred of Middleton, in Kent, forfeits all his goods and chattels to the king.

BASTARD diſeaſes, &c. See **SPURIOUS**.

BASTARD dittany, &c. See **DITTANY**.

BASTERNA*, a kind of vehicle, or chariot, uſed by the ancient Roman ladies.

* Papias thinks, that *baſterna* was firſt wrote for *wiſterna*; Roiweid ſays, it ſhould be *vicia ſterna*, which he concludes from Lidoro, who ſays, *baſterna, vicia ſterna*. But the word ſeems better derived from the Greek *βαρύνω, porto, I carry*.

Salmaſius obſerves, that the *baſterna* ſucceeded the *leſſena*, or litter; from whence it differed very little, except that the litter was borne on the ſhoulders of ſlaves, and the *baſterna* borne or drawn by beaſts. Cauſabon ſays, it was borne by mules. F. Daniel, Mabillon, &c. aſſert it was drawn by oxen, to go the more gently: and Gregory de Tours gives an inſtance of its being drawn by wild bulls. The inſide they called the *arvea*, or cage: it had foft cuſhions or beds, beſides glaſſes on each ſide, like our chariots.

The mode of *baſterna's* paſſed from Italy into Gaul, and thence into other countries; and to this we owe our chariots; which, though we call them *currus*, yet have they no conformity to the ancient *currus*, but are in effect *baſterna's* improved.

The *baſterna* appears alſo to have been uſed in war, for carrying of baggage.

BASTILE denotes a ſmall antique caſtle, fortified with turrets. Such is the *baſtile* of Paris, which ſeems the only caſtle that has retained the name: it was begun to be built in 1369, by order of Charles V. and finiſhed in 1383, under the reign of his ſucceſſor.—Its chief uſe is for the cuſtody of ſtate-prifoners.

BASTION, in the modern fortification, a huge maſſive of earth uſually faced with ſods, ſometimes with brick, rarely with ſtone, ſtanding out from a rampart, whereof it is a principal part.

This answers to what in the ancient fortification is called a *bulwark*.

A *bastion* consists of two faces and two flanks.—The faces are the lines BC and CS, (*Tab. fortificat. fig. 1.*) including the angle of the *bastion*. See *FACE*.—The flanks are the lines BA, SD.

The union of the two faces makes the outmost or salient angle, called also the *angle of the bastion*, BCS.

The union of the two faces to the two flanks make the side angles, called the *shoulders* or *epaules of the bastion*.

And the union of the two other ends of the flanks to the two curtains, the angles of the flanks of the *bastion*.—See *Tab. Fortific. fig. 21. lit. oo. &c. ppp.*

The foundation of the *bastion*, i. e. of a work consisting of flanks and faces, is that great rule in fortification, viz. that every part of a work must be seen and defended, from some other part: more angles therefore are not sufficient, but flanks and faces are indispensably requisite.—If the *bastions* EFG and HIK, *fig. 26.* consisted of faces alone, the angles G and H could not be defended from the lines FG or IH. But if the *bastion* consist of flanks and faces, as ABCSD, all the points may be defended from the flanks; there being none, *v. gr.* in the face BC, but what may be defended from the opposite flank EL, nor any in the curtain AE, but may be defended from the adjacent flanks BA and E L; nor any in one flank BA, but may be defended from the other EL.

For the proportions of the faces, they are not to be less than twenty-four Rhineland perches, nor more than thirty.

The flanks of *bastions* are better as they are longer, provided they stand at the same angle under the line of defence: hence the flank must stand at right angles to the line of defence. Indeed, in the ancient fortification, the flank is made perpendicular to the curtain, so as to have the angle out of the enemies eye; but this is now provided for, by withdrawing the lower part of the flank two or three perches, towards the capital line: which part, thus withdrawn, is better, if made concave, than rectilinear; and, if double, with a ditch between, than if single.

The business of disposing the flanks of *bastions* makes the principal part of the art of fortification; it is that on which the defence principally depends, and which has introduced the various forms and manners of fortifying.

If the angle of the *bastion* be less than sixty degrees, it will be too small to give room for guns; and besides, so acute as to be easily beaten down by the enemies guns: to which may be added, that it will either render the line of defence too long, or the flanks too short: it must therefore be more than sixty degrees; but whether or no it should be a right angle, some intermediate angle between sixty and ninety, or even whether or no it should exceed a right angle, is still disputed. Hence it follows, that a triangle can never be fortified, in regard either some or all of the angles will be either sixty degrees, or less than sixty.

Bastions are of divers kinds, *solid, void, flat, cut, &c.*

Solid BASTIONS are those that are filled up entirely, and have the earth equal to the height of the rampart, without any void space towards the centre.

Void or hollow BASTIONS are those surrounded with a rampart, and parapet only ranging round their flanks and faces, so as to leave a void space towards the centre; where the ground is so low, that if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the besieged.

Flat BASTION is a *bastion* built on a right line in the middle of a curtain, when it is too long to be defended by the *bastion* at its extremes.

Cut BASTION is that, whose point is cut off, and in lieu thereof has a re-entering angle, or an angle inwards with two points outwards; this is sometimes also called, *bastion with a tenaille*; and is used either, when, without such a contrivance, the angle would be too acute, or when water or some other impediment hinders the carrying on the *bastion* to its full extent.

Composed BASTION is, when the two sides of the interior polygon are very unequal, which makes the gorges also unequal.

Regular BASTION, is that which hath its due proportion of faces, flanks, and gorges; the faces being of an equal length, the flanks the same, and the two angles of the shoulder equal.

Irregular BASTION is, where this proportion and equality is not observed.

Deformed BASTION is, where the irregularity of the lines and angles make the *bastion* out of shape, as when it wants one of its demi-gorges; one side of the interior polygon being too short.

Demi-BASTION is that which hath but one face and one flank; called also an *epaulement*.

To fortify the angle of a place that is too acute, they cut off the point, and make two *demi-bastions*, which form a tenaille, or a re-entering angle.—Their chief use is before a hornwork or crownwork.

Double BASTION is that, which on the plain of the great *bastion* has another *bastion* built higher, somewhat after the manner of a cavalier; leaving twelve or eighteen feet between the parapet of the lower and the foot of the higher.

Capital of a BASTION.

Gorge of a BASTION.

Distance of the BASTION.

BASTION company of France. See *COMPANY*.

BASTON *, in law, is used for one of the warden of the fleet's men, who attends the king's courts with a red staff, for taking such to ward as are committed by the court; and likewise attends on such prisoners as are suffered to go at large by licence.

* The word is French, where it literally signifies a *staff*, and technically a *verge* or *mace*.

BASTON, or *BATOON*, in architecture, denotes a mould in the base of a column, otherwise called a *torc*.—See *Tab. Archit. fig. 3. and 24. lit. t.*

BASTON, or *BATOON*, in heraldry, a kind of bend which has only one third of the usual breadth.

The *bastion* does not go from side to side of the escutcheon, as the bend or scarf does, but is broken off short, in form of a truncheon: its use is as a mark of *bastardy*.

BASTON also signifies the earl marshal's staff.

BATCHELOR. See the article *BACHELOR*.

BAT-FOWLING, a method of catching birds in the night, by lighting some straw or torches near the place where they are at roost: for, upon beating them up, they fly to the flames, where, being amazed, they are easily caught in nets, or beat down with bushes fixed to the ends of poles, &c.

BATH, *BALNEUM*, a convenient receptacle of water for persons to wash, or plunge in, either for health or pleasure.

Baths are either *natural* or *artificial*. *Natural*, again, are either *hot* or *cold*.

Hot BATHS, called by the ancients *thermae*, owe their origin partly to the admixture of sulphureous particles, while the water is passing through its subterraneous canals, or rather while it creeps through beds and mines of sulphur, &c. and partly to the fumes and vapours exhalting through the pores of the earth where sulphur is, either pure or impure, as in coals, amber, &c.—Though in most *hot baths* there are likewise mixed particles of iron, allom, nitre, and other mineral bodies, which give them an acid astringent taste.

The chief *hot baths* in our country are that near Wells, in Somersetshire; and those others at Buxton and Matlock in Derbyshire; which latter, however, are rather warm or tepid than hot.

In the city of Bath there are four *hot baths*: one triangular, called the *crofs bath*, from a cross that formerly stood in the midst of it; the heat of which is more gentle than that of the others, because it has fewer springs.—The second is the *hot bath*, which heretofore was much hotter than the rest, when it was not so large as it now is.—The other two are the *king's* and *queen's baths*, divided only by a wall; the last having no spring, but receiving the water from the king's *bath*, which is about sixty feet square, and has in the middle of it many hot springs, which render its healing quality more effectual.—Each of these is furnished with a pump to throw out water upon the diseased, where that is required.

The waters abound with a mineral sulphur: they are hot, of a bluish colour, and strong scent, and send forth thin vapours.—They do not pass through the body like most other mineral waters; though if salt be added, they purge presently. On settlement they afford a black mud, which is used by way of cataplasm in aches; of more service to some than the waters themselves: the like they deposit on distillation, and no other.

Dr. Astruc found the colour of the salt drawn from the *king's* and *hot bath*, to be yellow; and that from the *crofs bath*, white; whence he concludes, that the *crofs bath* has more allom and nitre than the *better*, which abounds more with sulphur; and yet the *crofs bath* is found to loosen shrunken sinews, by which it should seem to abound less with allom: it is harsher to the taste than the others, and soaks the hands more.—The *crofs bath* preys on silver, and all of them on iron, but none on brass.

Hot BATHING, it is observed, increases the weight of the body for the present, but causes a plentiful perspiration afterwards; though not so great as set down by Dr. Keill, who makes it amount to 1 1/2 pound in an hour's time.—By Mr. Martyn's experiment at Buxton, it was only 5 ounces in one hour, and from 8 to 12 ounces in an hour and half. *Phil. Trans. N^o. 407. p. 27.*

The use of these *baths* is found beneficial in diseases of the head, as palsies, &c. in cuticular diseases, as leprosy, &c. obstructions and constipations of the bowels, the scurvy and stone, and in most diseases of women and children.—The *baths* have performed many cures, and are commonly used as a last remedy in obstinate chronic diseases; where they succeed well, if they agree with the constitution of the patient: but whether they will agree or not, cannot be known without trial.

Cold BATHS were long banished out of medicine, though the ancients had them in the greatest esteem: but the improvements accruing to phycic from geometry and mechanics, have brought them into use again; and the present age can boast abundance of noble cures performed by them, and such as were

were long attempted in vain by the most powerful medicines. The cold bath is found one of the most universal and innocent remedies yet discovered. It is serviceable in most chronic distempers, and is reckoned so safe, that physicians sometimes prescribe it in a beginning phtisis, or consumption, when the lungs are but slightly affected.

The effect of cold bathing is attributed not only to its chillness and constringing power, but in some measure to the weight of the water. — For, supposing a person immersed two foot, and the area of his skin to be fifteen foot, he sustains a weight of water, added to that of the air, = 2280 l. For 23 the number of cubical feet of water pressing upon a foot square of the skin $\times 76$, the number of pounds in a cubical foot of water, is = 152; which $\times 15$, the supposed number of square feet on the surface of the body, is = 2280 l. Troy. — Besides, the water in bathing enters the body, and mixes with the blood, and dilutes this as well as the other juices.

The rise and progress of cold bathing, and the cures effected thereby, are described at large in Sir J. Floyer's, and Dr. Baynard's *Hydrophoria*, or *History of cold bathing*.

Artificial BATHS are various, according to the various occasions; some aqueous, others vaporous, others dry, &c.

Aqueous BATHS are those prepared from common plants, and other substances of emollient, resolvent and nerve kinds.

Aqueous baths sometimes consist of milk and emollient herbs, with rose-water, &c. when the design is to humectate; at other times of bran and water, when the design is only to cleanse: sometimes again, they are made of a decoction of roots and plants, with an addition of spirit of wine, when a person bathes for a great pain or tumour, &c.

In **Vapour BATHS**, the fume or steam of some decoction is received upon the body to promote a perspiration. — These are also by some called *balnea Locustia*.

Vapour baths are, when the patient is not plunged into what is prepared for the bath, but only receives its steam upon those parts of his body which require it: as in some distempers of the fundament, and womb, where the patient sits and receives the fumes of some proper fomentation, &c.

To these may be added the *bagno*, where people are made to sweat by the heat of a room, and pouring on of hot water; after which they generally go into a hot bath. See **BAGNO**.

Dry BATHS are those made of ashes, salt, sand, shreds of leather, and the like.

The same name is sometimes also given to another kind of bath, made of kindled coals, or burning spirit of wine; the patient being placed in a convenient close chair for the reception of the fume, which rises and provokes sweat in a plentiful manner: care is here taken to keep the head out, and to secure respiration.

This bath has been found very effectual in removing old, obstinate pains in the limbs, and venereal complaints; and will often complete a cure left unperformed by salivation.

BATHS, BALNEA, in architecture, denote large pompous buildings among the ancients, erected for the sake of bathing. *Baths* made a part of the ancient gymnasia. Though they were frequented more for the sake of pleasure than health.

The most magnificent *baths* were those of Titus, Paulus Æmilius, and Dioclesian, of which there are some ruins still remaining. It is said, that at Rome there were 856 public *baths*. Fabricius adds, that the excessive luxury of the Romans, appeared in nothing more visible, than in their *baths*. Seneca complains, that the *baths* of plebeians were filled from silver pumps; and that the freed-men trod on gems. Macrobius tells us of one Sergius Oratus, a voluptuary, who had *pendant baths*, hanging in the air.

Knights of the BATH, a military order in England, instituted by Richard II. who ordained that there should be no more than four; however, his successor Henry IV. increased them to forty-six. Their motto was *Tres in uno*, signifying the three theological virtues.

It was the custom to bathe before they received the golden spurs; but this was only observed at first, being afterwards gradually dropt: however, it was this occasioned the denomination of *knights of the bath*.

The order of *knights of the bath* is scarce ever conferred, but at the coronation of kings, or the inauguration of a prince of Wales, or duke of York. They wear a red ribbon belt-wife.

Camden and others say, Henry IV. was the institutor in 1399, and upon this occasion: that prince, being in the bath, was told by some knight, that two widows came to demand justice of him; when his majesty leaping out of the bath, cried, He ought to prefer doing justice to his subjects to the pleasure of the bath; and thereupon created *knights of the bath*.

Some authors, however, will have the order of the bath to have been on foot long before Henry IV. even as early as the Saxon times: at least, it is certain, the bath had been used long before, in the creation of knights, in France; though there was no order of knights under this name.

The order of the Bath, after remaining many years extinct,

VOL. I.

was revived under king George I. by a solemn creation of a great number of knights.

BATH metal. See the article **METAL**.

BATHMUS, or **BATHMIS**, βαθυς, or βαθυς, an appellation given to such cavities of bones as receive the promiscuities of other bones into them.

BATON, or **BATOON**. See the article **BASTON**.

BATRACHITES*, among ancient naturalists, a kind of gem, found in Egypt, denominated from its resemblance in colour to a frog.

* The word is formed from the word βατραχον, rana, a frog.

BATRACHOMYOMACHIA*, battle of the frogs and the mice; the title of a fine burlesque poem; usually ascribed to Homer.

* The word comes from the Greeks βατραχον, frog, μυς, mouse, and μαχη, pugna.

The subject of the war is the death of Psycharax, a mouse, son of Toxartes, who being mounted on the back of Phylignates, a frog, on a voyage to her palace, to which she had invited him, was seized with fear when he saw himself in the middle of the pond, so that he tumbled off and was drowned. Phylignates being suspected to have shook him off with design, the mice demanded satisfaction, and unanimously declared war against the frogs.

Stephens, Nunnsius, and other modern authors, take the poem not to be Homer's; but several of the ancients seem of another opinion; and Statius, who wrote under Domitian, makes no doubt of it.

BATTLE* ground denotes land lying between England and Scotland, heretofore in question to which it belonged, when they were two distinct kingdoms.

* The word imports as much as litigious, or disputable ground: from battre, to beat or fight.

BATTALION*, in the military art, a little body of infantry ranged in form of battle, and ready to engage.

* The word comes from *battail*, an engagement of two armies, &c. and that from *battaglia*, the place where two men fight; or from *battalia*, the exercise of people who learn to fight.

A battalion usually contains from 5 to 800 men; of which one third were formerly pikes in the middle, and the other two thirds muskets posted on the wings: but the number of men it consists of is not determined.

Battalions are usually drawn up with fix men in file, or one before another. — Some regiments consist but of one *battalion*, which is too few, others more numerous are divided into four or five, which are too many.

Angle of a BATTALION.

Fraizing a BATTALION. } See the article { **ANGLE**.

Square BATTALION. } { **FRAIZING**.

} { **SQUARE**.

BATTEN, a name which the workmen give to a cantling of wooden stuff, from two to four inches broad, and about an inch thick; the length being pretty considerable, but undetermined.

The term is chiefly used in speaking of doors, &c. which are not framed of whole deal, &c. with stiles, rails, and panels, like waincot, but are made to appear, as if they were, by means of these pieces, or *battens*, bradded on the plain board round the edges, and sometimes cross them, and up and down.

Hence *batten-doors*, or windows, are such as seem to be waincot ones, but are not. These are said to be either *single* or *double*, as the *battens* are fitted on to one side, or to both.

BATTERING, the attacking a place; work, or the like, with heavy artillery. See **BATTERY**.

To BATTER in breach, *battre en breche*, is to play furiously on a work, as the angle of a half-moon; in order to demolish and make a gap therein. See **BREACH**.

In this, they observe, never to fire a single piece against the top of the wall; but all towards the bottom: 3, 4, 5, or 6 foot from the ground: they also fire par camarade, all together, till they perceive the earth fall from behind the lining of the rampart. *Savin, Nouv. Ecol. Milit. p. 248.*

BATTERING-pieces, or pieces of battery. See **CANNON**.

BATTERY*, in the military art, denotes an eminence cast up, whereon to plant artillery; that it may play to better advantage. — See *Tab. Fortif. fig. 21. n. 33. and fig. 23.*

* The word is French, formed of *battre*, to beat, strike.

In all *batteries*, the open space left to put the muzzles of the great guns out at, are called *embrasures*; and the distances between the *embrasures*, *merlons**. — The guns are generally about twelve foot distant one from another; that the parapet may be strong, and the gunners may have room to work.

* There are also *batteries of mortars*, the same with those of cannon, except that they have no merlons.

The *battery* of a camp is usually surrounded with a trench and palisades at the bottom, as also with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms, capable of covering the troops, which are appointed for their defence.

Sunk or buried BATTERY is that whose platform is sunk or let down into the ground, with trenches cut in the earth against the muzzles of the guns, to serve for embrasures.

This fort, which the French call *batterie en terre*, and *rui-nante*, is generally used upon the first making approaches, to beat down the parapet of the place.

Cross-BATTERIES are two batteries at a considerable distance from each other, which play a-thwart one another at the same time, and upon the same point, forming right angles; where, what one bullet shakes, the other beats down.

BATTERY *d'enslade* is one which sweeps the whole length of a strait line, a street, &c.

BATTERY *en echarpe*, is that which plays obliquely.

BATTERY *de revers*, or *murdering battery*, is one that plays on the back of any place; and being placed on an eminence, sees into it.

BATTERY *joint*, or *par camarade*, or *cameretta*, is when several guns play at the same time upon one place.

BATTERY *en rouage* is that used to dismount the enemy's cannon.

BATTERY, in law, denotes an act that tends to the breach of the peace of the realm, by striking, beating, or offering other violence to another person.

Battery is frequently confounded with *assault*, though in law they are different offences; for that in the trespasses for *assault* and *battery*, one may be found guilty of the assault, yet acquitted of the *battery*: there may therefore be *assault* without *battery*; but *battery* always implies an *assault*.

BATTEURS *d'esfrade*, *scoots*, or horsemen sent out before, and on the wings of an army, two or three miles, to make discoveries; of which they are to give an account to the general.

BATTLE, an action which passes between two armies ranged in order of *battle*, and who engage in a country sufficiently open for them to encounter in front; and, at the same time, or at least for the greater part of the line to engage, while the remainder remains in fight, by reason of some difficulty, which hinders it from entering so readily into action, with a front equal to that which may be opposed to it by the enemy.

Other great actions, though generally of a longer duration, and even frequently attended with greater slaughter, are only called *fight*s, by the French *combats*. *Freq. Mem. c. 80.*

A battle lost almost always draws with it the loss of the artillery of the army, and frequently also that of the baggage: consequently, as the army beaten cannot again look the enemy in the face till it have repaired those losses, it is forced to leave the enemy a long time master of the country, and at liberty to execute all its schemes.—Whereas a great fight lost is rarely attended with a loss of all the artillery, and scarce ever of the baggage, because the two armies not meeting in front, they can only have suffered in the part that has been engaged. *Freq. loc. cit.*

An ingenious modern author remarks, that it is not, usually, the real loss sustained in a *battle* (that is, of some thousands of men) that proves so fatal to a state; but it is the imaginary loss, and discouragement, which deprives it of the use of those very powers which fortune had left it. *Confid. sur les Caus. de la Grand. des Rom. c. 4. p. 39.*

The history of *battles* is only the history of the faults and overights of generals: luckily enough, the mistakes of the two opposite commanders generally balance one another: one of them makes a fault, and the other overlooks, or does not take advantage of it. M. de Feuquieres's *Remarks sur la Guerre* is little else but a recital of mistakes on both sides: he scarce speaks of one modern general, except Turenne, Luxembourg, and the prince of Condé, whose conduct was not full of them: Crequi, and Catinat, were guilty of great ones; which, however, they compensated by their judicious conduct on other occasions. *Freq. ubi supra.*

For *Naval BATTLES*, or *sea-fights*.—It is observable, that the ancient and usual way of fighting in our fleets was board and board, yard-arm and yard-arm, through and through; and not at a distance in a line or half-moon, as is now done: which practice our old sailors say they were strangers to.—For this reason our guns are shorter, and of larger bore than those of the French, which are adapted to the method of fighting in line of battle; as being longer, and carrying farther. So that we engage with them in this way at a disadvantage.—It has been often found that their balls will fly over our ships, before ours can reach them by a mile. *Dennis Eff. on Navy, sect. 2.*

BATTLE is also used figuratively for a representation of a battle in sculpture, painting, or the like.—The battles of Alexander in the gallery of the Louvre, painted by le Brun, are held by the French the noblest pieces of painting that have been executed on this side the Alps. *Litt. Journ. to Paris.*

Line of BATTLE. } LINE.
Order of BATTLE. } ORDER.
Square BATTLE. } SQUARE.
Tactical BATTLE. } DUEL, CHAMPION, &c.
Attainder by BATTLE. } ATTAINDER.

BATTLEMENTS, in the military art, indentures, or notches on the top of a wall, parapet, or other building, in

form of embrasures, for the sake of looking through them, &c. much affected in the old fortification.

BATTOLOGY, in grammar, a multiplying of words without occasion, or a needless repetition of the same words, or things over and above.

BATTOON, BATOON, or BASTON. See BASTON.

BATTUS, an order of penitents at Avignon, and in Provence, whose piety carries them to exercise severe discipline upon themselves, both in public and private.

BAU. See NUMERICAL CHARACTER.

BAVINS, in war, brush-faggots, made with the brush at length. See FASCINES.

BAY, in geography, denotes a little gulph; or an arm of the sea, stretching up into the land; being larger in the middle within, than at its entrance, which is called the *mouth of the bay*.

BAY, likewise signifies a pen, or pond-head, made up a great height, to keep in store of water for driving the wheels of a forge or furnace of an iron mill, by the stream that comes thence through a passage, or flood-gate, called the *pen-stock*.

Among huntsmen, deer are said to *bay*, or *be at bay*, when, after being hard run, they turn head against the hounds.

BAY, or BAYES, is also a sort of woollen stuff, made chiefly in Colchester; where there is a hall, called the Dutch Bay-hall, or Raw-hall.

None shall weave in Colchester any *bay* known by the names of *four-and-fifties*, *sixties*, *sixty-eights*, *eighties*, or *hundred bays*, but within two days after weaving they shall carry it to the Dutch Bay-hall, to be viewed and searched; that it may appear whether it be well and substantially wrought, before it be carried to be scoured and thicked: and, no fuller or thicker is to receive such bay before it have been stamped or marked at said hall. 12 Car. 2. c. 22.

BAY-salt. See the article SALT.

BAY-yarn, is a denomination sometimes used promiscuously with woollen-yarn. 10 & 11 W. 3. c. 10. 5 G. 2. c. 21. See YARN, &c.

BAYONET, a short broad dagger, made lancet-fashion, and having, instead of an hilt, an hollow iron handle to fix it to the end of a musket, so as not to hinder its firing or charging.

Bayonets are of great service to the dragoons and fuzileers, after they have spent their powder and ball.

This instrument is also used in hunting the boar or bear; for which purpose it is made larger than for the military use.

BAYS, in commerce, a kind of coarse, open woollen stuff, having a long nap; sometimes frized on one side, and sometimes not frized, according to the uses it is intended for.

This stuff is without wale, being wrought on a loom with two treddles, like flannel.—The manufacture of *bays* is very considerable in England, particularly about Colchester; and in Flanders, about Lille and Tournay, &c.

Formerly the French, as well as Italians, were furnished with *bays* from England; but of late the French workmen have undertaken to counterfeit them, and set up manufactures of their own; and that with success; especially at Nîmes, Montpellier, &c.

The export of *bays* is very considerable to Spain, Portugal, and Italy. Their chief use is for linings, especially in the army: the looking-glass-makers also use them behind their glasses, to preserve the tin or quicksilver; and the cake-makers to line their cakes.

BDELLIUM *, BAEALION, an aromatic gum, brought from the Levant, of some use, both as a medicine and a perfume.

* The word is supposed to have been formed of the Hebrew בדרלל, *bedellach*, which the English translators render by the appellation *bdellium*. It is also written *bedellium*, *bedilla*, *petellum*, *petalium*, *megalum*, and *telinum*.

There is much uncertainty concerning *bdellium*: we find mention of the name both among the ancient naturalists, and in scripture; but it is doubtful whether any of these be the same with the modern kind. As for the scripture *bdellium*, we know very little of it. Moses describes *manna* as of the colour of *bdellium*; and Josephus explains the passage, by saying it is the gum of a tree resembling the olive-tree; and that the *manna* wherewith the Jews were fed in the desert resembled this drug.—But Scaliger and others set aside this explanation, and own, they do not know what the *bdellium* mentioned in scripture is.

BEACON, a signal for the better securing the kingdom from foreign invasions. See SIGNAL.

On certain eminent places of the country are placed long poles erect, whereon are fastened pitch-barrels to be fired by night, and smoke made by day, to give notice, in a few hours, to the whole kingdom of an approaching invasion.—These are commonly called *beacons*; whence also comes *beaconage*.

BEACONS are also marks and signs for the sea; erected on the coasts by the masters, &c. of Trinity-houses, who are empowered thereto by act of parliament, 8 EL. c. 13.—Whitaker *beacon* having been blown down in the storm, a buoy

was laid, till a *beaton* could be conveniently replaced. *Advert. Trin. Houf.*

BEACONAGE*, money paid towards the maintenance of a *beacon*.

* The word is derived from the Saxon *beacnian*, to nod, or throw by a sign: hence also the word *becon*.

BEAD, in architecture, denotes a round moulding, carved in short embossments, like beads in necklaces.

Sometimes also an astragal is carved *bead-fashion*.

There are also a sort of *beads plain*, frequently set on the edge of each fascia of an architrave; sometimes also on the lining-board of a door-case; and on the upper end of skirting-boards.

BEADS, in a religious sense. See **CHAPLET**.

BEAD-ROLL, among the Romish priests, a list or catalogue of such persons, for the rest of whose souls they are obliged to rehearse a certain number of prayers, &c. which are told by means of their *beads*.

BEADLE, or **BEDEL**, **BEDELLUS**, signifies a messenger or apparitor of a court, who cites men to appear and answer.

BEADLE is also used for an officer in universities, whose place it is to walk before the masters at all public processions, &c. with a mace.

Some say they are called *bedelli*, from a corruption of *pedelli*, as serving and running on foot. Others from *pedo*, *scu baculo*, *quia virga utebantur*; forming *pedellus* from *pedum*, a kind of wand, which is their symbol; and from *pedellus*, *bedellus*. Others derive the word from the Hebrew *בדל* *bedal*, *ordinare*, to range, or dispose.

Spelman, Vossius, and Somner, derive *bedale* from the Saxon *bidel*, a public crier; in which sense bishops, in some ancient Saxon manuscripts, are called *bedalles* of God, *Dei bedelli*.—The translator of the Saxon New Testament, renders *exactor* by *bedale*; and, the word is used in the same sense in the laws of Scotland.

BEAK, in architecture, a little fillet left on the edge of a larmier, which forms a canal, and makes a kind of pendant chain; answering to what Vitruvius calls the *mentum*.

BEAK, or **BEAK-head**, of a ship, is that part without the ship, before the fore-castle, which is fastened to the stem, and is supported by the main knee: this is usually carved and painted, and, besides its use, makes the becoming part, or grace of a ship.

BEAM, in architecture, the largest piece of wood in a building; being laid a-cross the walls, and serving to support the principal rafters of the roof.

No house has less than two of these *beams*, viz. one at each head; into these the girders of the garret floor are also framed; and, if the building be of timber, the teazle-tenons of the posts.

The proportions of *beams* near London are fixed by statute, as follows: a *beam* 15 foot long, must be seven inches on one side its square, and five on the other: if it be 16 foot long, one side must be eight inches, the other six: if 17 foot long, one side must be ten inches, the other six: in the country they usually make them stronger. Sir H. Wotton advises these to be of the strongest and most durable timber.

Herrera tells us, that in Fer. Cortez's palace, in Mexico, there were 7000 *beams* of cedar: but, he must certainly use the word *beam* in a greater latitude than we do. In effect, the French, under *poutre*, *beam*, take in not only the pieces which support the rafters, but also those which sustain the joists for the ceilings.

Some of their best authors have considered the force or strength of *beams*, and brought their resistance to a precise calculation; particularly M. Varignon, and M. Parent; the system of the latter is as follows.

When, in a *beam* breaking parallel to its base, which is supposed to be a parallelogram, two plans of fibres, which were before contiguous, are separated, there is nothing to be considered in those fibres, but their number, bigness, tension before they broke, and the lever by which they act; all these together making the strength or resistance of the *beam* to be broke.

Suppose then another *beam* of the same wood, where the base is likewise a parallelogram, and of any bigness, with regard to the other, at pleasure; the height or thickness of each of these, when laid horizontal, being divided into an indefinite number of equal parts, and their breadth into the same number, in each of their bases will be found an equal number of little quadrangular cells, proportional to the bases whereof they are parts.—These then will represent little bases, or which is the same thing, the thicknesses of the fibres to be separated for the fracture of each *beam*: and, since the number of cells is equal in each, the ratio of the bases of both *beams* will be that of the resistance of their fibres, both with regard to number and thickness.

Now, the two *beams* being supposed of the same wood, the fibres most remote from the points of support, which are those which break the first, must be equally stretched when they break. Thus the fibres, *v. gr.* of the 10th division, are equally stretched in each case, when the first breaks; and in whatever proportion, the tension be supposed,

it will still be the same in both cases; so that the doctrine is entirely free, and unembarrassed with any physical system.

Lastly, it is evident, the levers whereby the fibres of the two *beams* act, are represented by the height or depth of their bases; and, of consequence, the whole resistance of each *beam* is the product of its base by its height; or, which is the same thing, it is the square of the height multiplied by the breadth: which holds, not only in case of parallelogrammatic, but also of elliptic bases.

Hence, if the bases of two *beams* be equal, though both their heights and breadths be unequal, their resistance will be as their heights alone; and, by consequence, one and the same *beam* laid on the smallest side of its base, will resist more than when laid flat, in proportion as the first situation gives it a greater height than the second: and thus an elliptic base will resist more, when laid on its greatest axis, than when on its smallest.

Since, in *beams* equally long, it is the bases that determine the proportion of their weights or solidities; and since their bases being equal, their heights may be different, two *beams* of the same weight may have resistances differing to infinity: thus, if in the one, the height of the base be conceived infinitely great, and the breadth infinitely small, while in the other the dimensions of the base are infinite; the resistance of the first will be infinitely greater than that of the second, though their solidity and weight be the same. If therefore all required in architecture were to have *beams* capable of supporting vast loads, and at the same time be of the least weights possible, it is plain they must be cut thin as laths, and laid edge-wise.

If the bases of two *beams* be supposed unequal, but the sum of the sides of the two bases equal, *v. gr.* if they be either 12 and 12, or 11 and 13, or 10 and 14, &c. so that they always make 24; and further, if they be supposed to be laid edge-wise; pursuing the series, it will appear, that in the *beam* of 12 and 12 the resistance will be 1728, and the solidity or weight 144; and that in the last, or 1 and 23, the resistance will be 529, and the weight 23: the first therefore, which is square, will have less than half the strength of the last, with regard to its weight.

Hence M. Parent remarks, that the common practice of cutting the *beams* out of trees as square as possible, is ill husbandry: he hence takes occasion to determine geometrically, what dimensions the base of a *beam*, to be cut out of any tree proposed, shall have, in order to its being of the greatest possible strength; or, which is the same thing, a circular base being given, he determines the rectangle of the greatest resistance that can be inscribed; and finds, that the sides must be nearly as 7 to 5, which agrees with observation.

Hitherto the length of the *beams* has been supposed equal; if it be unequal, the bases will resist so much the less, as the *beams* are longer.

To this it may be added, that a *beam* sustained at each end, breaking by a weight suspended from its middle, does not only break at the middle, but also at each extreme; or, if it does not actually break there, at least immediately before the moment of the fracture, which is that of the equilibrium between the resistance and the weight, its fibres are as much stretched at the extremes, as in the middle.—So that, of the weight sustained by the middle, there is but one third part which acts at the middle, to make the fracture; the other two only acting to induce a fracture in the two extremes.

A *beam* may either be supposed loaded only with its own weight, or with other foreign weights applied at any distance, or else only with those foreign weights. Since, according to M. Parent, the weight of a *beam* is not ordinarily above $\frac{1}{3}$ part of the load given it to sustain, it is evident, that in considering several weights they must all be reduced by the common rules to one common centre of gravity.

M. Parent has calculated tables of the weights that will be sustained by the middle, in *beams* of various bases and lengths, fitted at each end into walls, on a supposition that a piece of oak of an inch square and a foot long, retained horizontally by the two extremes, will sustain 315 lb. in its middle before it breaks, which it is found by experience it will. See *Mém. Acad. R. Scienc. an. 1708*.

BEAM, among hunters, denotes the main stem of a deer's head, or that part which bears the antlers, royals, and tops; the little streaks wherein are called circles.

BEAMS of a ship are the large, main, cross timbers, which hold the sides of a ship from falling together, and which also support the decks and orlops. See **SHIP**.

The main *beam* is that next the main mast; and from it they are reckoned by first, second, and third *beam*. The great *beam* of all is called the *midship beam*. See *Tab. Ship, fig. 2. n. 36, 45, 61, 28, 91, 87*.

Camber-BEAM. See the article **CAMBER-BEAM**.

BEAM-Compasses, an instrument made in wood or brass, with sliding sockets, or cursors, serving to carry several shifting points, in order to draw and divide circles with very long radii.

They are of use in large projections for drawing the furniture on wall-dials, &c. See **COMPASSES**.

BEAM-Filling, in building, the filling up the vacant space between the rafter and roof, with stones, or bricks, laid between the rafters on the rafter, and plastered on with loam; this is frequent where the garrets are not pargeted, plastered.

BEAR, in astronomy, a name given to two constellations called the *greater* and the *lesser bear*; or *ursa major* and *minor*. See **URSA**.

The pole-star is said to be in the tail of the *lesser bear*; this star is never above two degrees distant from the north-pole of the world.

BEARD, the hair growing on the chin, and adjacent parts of the face; chiefly of adults and males. See **HAIR**. Various are the ceremonies and customs the *beard* has been liable to: Kingdon assures us, that a considerable branch of the religion of the Tartars consists in the management of their *beards*; and that they waged a long and bloody war with the Persians, and declared them infidels, though, in other respects, of the same faith with themselves, merely because they would not cut their whiskers after the mode or rite of the Tartars.

Athenæus, from Chrypsippus, observes, that the Greeks always wore their *beards* till the time of Alexander; and that the first who cut it at Athens ever after bore the addition of *καρπός*, shaven, in medals. Plutarch adds, that Alexander commanded the Macedonians to be shaven, lest the length of their *beards* should give a handle to their enemies: however this be, we find Philip, his father, as well as Amyntas and Archelaus, his predecessors, represented on medals without *beards*.

Pliny observes, that the Romans did not begin to shave till the year of Rome 454, when P. Ticinius brought over a flock of barbers from Sicily: He adds, that Scipio Africanus was the first who introduced the mode of shaving every day.

Among that people, it became the custom to have visits made in form at the cutting of the *beard* for the first time: the first fourteen Roman emperors shaved, till the time of the emperor Adrian, who retained the mode of wearing the *beard*. Plutarch tells us, he did it to hide the scars in his face.

Formerly there was a great deal of ceremony used in blessing the *beard*; and there are still extant the prayers used in the solemnity of consecrating it to God, when an ecclesiastic was shaven.

Persons of quality had their children shaved the first time by others of the same, or greater quality, who, by this means, became god-father, or adoptive father of the children.

Anciently, indeed, a person became god-father of the child by barely touching his *beard*: thus historians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the *beard* of Clovis to become his god-father. See **GOD-FATHER**.

As to ecclesiastics, the discipline has been very different on the article of *beards*: sometimes they have been enjoined to wear them, from a notion of too much effeminacy in shaving, and that a long *beard* was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath a venerable *beard*.

The Greek and Romish churches have been long together by the ears about their *beards*: since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions *de radendis barbis*.

The Greeks, on the contrary, espouse very zealously the cause of long *beards*, and are extremely scandalized at the beardless images of saints in the Roman churches.

By the statutes of some monasteries, it appears, that the lay-monks were to let their *beards* grow, and the priests among them to shave; and that the *beards* of all that were received into the monasteries were blessed with a great deal of ceremony.

To let the *beard* grow is a token of mourning in some countries, and to shave it is so in others. Le Comte observes, that the Chinese affect long *beards* extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with infinite care: the Europeans are strangely envied by them on this account, and esteemed the greatest men in the world.

The Russians wore their *beards* till within these few years, when the Czar Peter enjoined them all to shave; but, notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the *beards* of such as would not otherwise part with them.

Chrysostom observes, that the kings of Persia had their *beards* wove or matted together with gold thread; and some of the first kings of France had, in the same manner, their *beards* knotted and buttoned with gold.

BEARD of a Comet denotes the rays which the comet emits towards that part of the heavens to which its proper motion seems to direct it.

In which the *beard* of the comet is distinguished from the *tail*,

which is underflood of the rays emitted towards that part from which its motion seems to carry it. See **TAIL**. It is called *beard*, from some fancied resemblance it bears to the *beard* of a man.

BEARDING of Wool. See the article **WOOL**.

BEARER, in architecture, a post, or brick-wall, trimmed up between the two ends of a piece of timber, to shorten its bearing, or to prevent its bearing with the whole weight at the ends only.

BEARER of a bill of exchange denotes the person in whose hands it is, and in favour of whom the last order or endorsement was made.

When a bill is said to be *payable to bearer*, it is understood to be payable to him, who first offers himself after it becomes due. To be paid a bill of this kind, there needs neither order or transfer; yet it is good to know to whom it is paid. See **BILL OF EXCHANGE**.

BEARERS, in heraldry. See **SUPPORTERS**.

Cross-BEARER. See the article **CROSS**.

BEARING, in geography and navigation, the situation of one place from another, with regard to the points of the compass; or the angle, which a line drawn through the two places makes with the meridians of each.

The *bearings* of places on the ground are usually determined from the magnetic needle: in the managing of these lies the principal part of surveying; since the *bearing* and distance of a second point from a first being found, the place of that second is determined; or the *bearings* of a third point from two others, whose distance from each other is known, being found, the place of the third is determined: instrumentally we mean; for to calculate trigonometrically there must be more data.

Mr. Collins gives the solution of a problem in the *Philos. Transact.* where the distances of three objects on the same plain being given, and the *bearings* from a fourth place in the same plain observed, the distances from the place of observation to the respective objects are required.

BEARING, in the sea-language.—When a ship sails towards the shore, she is said to *bear in with the land*.—When a ship that was to windward comes under another ship's stern, and so gives her the wind, she is said to *bear under her lee*.—If a ship sails into an harbour with the wind large, or before the wind, she is said to *bear in with the harbour*, &c.

In conding they say, *bear up the helm*, that is, let the ship go more large before the wind—*bear up round*, that is, let the ship go between her two fleets, directly before the wind.

They also say, a ship *bears*, when having too slender a quarter she will sink too deep into the water with an over-light freight, and therefore can carry but a small quantity of goods.

BEARING of a piece of timber, in carpentry, denotes the space either between the two fix extremes thereof, when it has no other support; which is called *bearing at length*: or between one extreme, and a post, brick-wall, or the like, trimmed up between the ends to shorten its *bearing*.

Joists are not to *bear* above 10 foot length; nor single rafters more than 9 foot. 19 Car. 2. c. 3.

BEARING is also a term in heraldry.—Thus, he that has a coat of arms, is said to *bear in* the several charges or ordinaries which are in his escutcheon: as, if there are three lions rampant in it, he is said to *bear three lions rampant*. See **CHARGE**, &c.

High-BEARING Cock. See the article **HIGH**.

BEASTS of Chase, in our statute books, are five; the buck, doe, fox, martin, and roe. See **CHASE**.

BEASTS of the forest are, the hart, hind, hare, boar, and wolf.

BEASTS and fowls of the warren are, the hare, coney, pheasant, and partridge. See **GAME**.

Rother-BEASTS. See the article **ROTHER**.

BEAT. See **MASS** of the *Beate*.

BEATIFIC Vision. See the article **VISION**.

BEATIFICATION, in the Romish church, the act whereby the pope declares a person happy, after death.

Beatification differs from *canonization*; in the former, the pope does not act as a judge in determining the state of the *beatified*, but only grants a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstitious worshippers: but, in *canonization*, the pope speaks as a judge, and determines *ex cathedra*, upon the state of the *canonized*.

Beatification was introduced, when it was thought proper to delay the canonization of saints, for the greater assurance of the truth, and manifestation of the rigorous steps taken in the procedure.

BEATING, *pulsation*, in medicine, is applied to the reciprocal agitation or palpitation of the heart and pulse. See **PULSATION**.

Some physicians distinguish 81 different kinds of simple *beatings*, and 15 compound ones. They compute 60 beats in the space of a minute, in a temperate man. But, in fact, we generally find a greater number.

BEATING of gold and silver. See **GOLD-BEATING**, &c.

BEATS, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance; or of the peds in a royal pendulum.

To find the *beats* of the balance in any watch, or in one turn of any wheel.—Having found the number of turns, which the crown-wheel makes in one turn of the wheel you seek for, (by the direction given under the word *TURN*) those turns of the crown-wheel, multiplied by its notches, give half the number of *beats* in that one turn of the wheel: for the balance or fwing has two strokes to every tooth of the crown-wheel: in as much as each of the two pallets has its blow against each tooth of the crown-wheel: whence it is, that a pendulum which beats seconds, has in its crown-wheel only 30 teeth.

To explain this, suppose the numbers of a sixteen hour watch wherein the pinion of report is 4, the dial-wheel 32, the great wheel 55, the pinion of the second wheel 5, &c. The number of the notches in the crown-wheel 17, being multiplied into 6336 (the product arising from the continual multiplication of the quotients 8, 11, 9, 8) gives 107712, for half the number of *beats* in one turn of the dial-wheel; for 8 times 17 is 136, which is half the number of *beats* in one turn of the contrate-wheel 40, and 9 times 136 is 1224, the half *beats* in one turn of the second-wheel; and 11 times 1224 is 13464, the half *beats* in one turn of the great wheel 55; and 8 times 13464 makes 107712. If you multiply this by the two pallets, i. e. double it, it gives 215424, which is the number of *beats* in one turn of the dial wheel, or 12 hours.

To know how many *beats* this watch has in an hour, divide the *beats* in 12 hours into 12 parts, and it gives 17952, which is called the *train* of the watch, or the *beats* in an hour.—If this be divided into 60 parts, it gives 299 and a little more, for the *beats* in a minute; and so you may proceed to seconds or thirds.

By the *beats* and turns of the fufy, the hours that any watch will go, may be found thus.—As the *beats* of the balance in one hour, to the *beats* in one turn of the fufy; so is the number of the turns of the fufy 1, to the continuance of the watch's going.—Thus, 20196: 26928 :: 12: 16.

To find the *beats* of the balance in one turn of the fufy, say, As the number of turns of the fufy, to the continuance of the watch's going in hours; so are the *beats* in one hour, to the *beats* of one turn of the fufy; i. e. 12: 16 :: 20196: 26928.

To find the *beats* of the balance in an hour, say, As the hours of the watch's going, to the number of turns of the fufy; so are the *beats* in one turn of the fufy, to the *beats* of an hour.—Thus, 16: 12 :: 26928: 20196.

BEAVER, the fur or skin of the *castor* or *beaver*; this is much used in the making of hats, and sometimes also in that of stockings, and even cloaths.

BEAVER is chiefly imported by the Hudson's-bay company, from the northern-parts of America; where the animal abounds.—There are chiefly two sorts: the *coat beaver*, which has been worn sometimes by the savages as a garment, and of course has imbibed much of the sweat of their bodies—and *parchment beaver*.

BEAUFET, **BUFFET**, or **BUFET**, was anciently a little apartment separated from the rest of a room by slender wooden columns, for the disposing china and glass ware, &c. called also a *cabinet*.

It is now, properly, a large table in a dining room, called also a *side-board*, for the plate, glasses, bottles, basons, &c. to be placed, as well for the service of the table, as for magnificence.

The *buffet*, among the Italians called *credenza*, is inclosed within a ballustrade, elbow high.

BEAU-MASS. See the article *MASS*.

BEAU-PLEADER, or **BEW-PLEADER**, a writ on the statute of Marlbridge, whereby it is provided, that no fine shall be taken of any man in any court for *fair-pleading*, i. e. for not pleading aptly, and to the purpose.

BEAUTY is a term whereby we express a certain relation of some object, either to an agreeable sensation, or to an idea of approbation.

When, therefore, I say, a thing is *beautiful*, I either mean that I perceive something that I approve, or that something gives me pleasure: whence it appears, that the idea annexed to the word *beauty* is double; which renders the word equivocal, and this is the source of most of the disputes on the subject of *beauty*.

We must therefore distinguish between *ideas* and *sensations*. Ideas take up the mind, sensations interest the heart. Though we see nothing in an object to interest us, we may yet discover something in its idea to merit our approbation. Such an object therefore pleases, and does not please, i. e. it pleases the understanding, and not the sense. On the contrary, there are some objects, whose ideas do not offer any thing laudable, which yet excite agreeable sensations. There is therefore *beauty* of two sorts.

It is exceeding hard to fix any general characteristic of *beauty*: for, as the ideas and sensations of different persons differ according to the habitudes of the body and the turn of the mind; so do the relations of objects to those ideas and sensations vary, whence what we call *beauty* results. Hence arise those different opinions of a *beautiful* thought, a *beautiful* woman, a *beautiful* painting, &c.

VOL. I.

Mr. Perrault distinguishes two kinds of *beauties* in architecture, which chime in pretty aptly with the two species of *beauty* above: the one, he calls *positive* and *convincing*, such as the richness of the materials, grandeur of the structure, neatness of the workmanship, symmetry, &c.

The others he calls *arbitrary*, which depend on the will, and which would admit of having their proportions changed without deformity. These only please by the connexion, or association of their ideas with others of a different kind which please of themselves; they owe their *beauty* to that prepossession of the mind, whereby a thing, whose value we do know, insinuates an esteem for others which we do not.

Thus, he observes, there are many things in architecture, which reason and good sense would judge deformed, and which, however, custom has not only made tolerable, but even *beautiful*, by their being always joined with other *beauties* that are positive. Thus, being at first pleased with viewing them in company, and merely on account of their company, at length we become pleased with them alone; and thus we frequently fall in love with deformities, and grow fond of faults.

Hence, the use of foils may seem founded on an ill philosophy. If a *beauty* takes off from a deformity, the deformity in its turn takes off from the *beauty*: it is the foil, therefore, is the gainer, the diamond loses. As the diamond pleases, we are pleased, in some measure, with every thing about it, particularly the foil; and as the foil displeases, we are in some measure disgusted with every thing about it, therefore with the diamond: the mind cannot be well pleased and displeased at the same time: by viewing the diamond and foil together, a man might in a long course of time find the one almost as *beautiful* as the other. The disparity would be always diminishing, till they came near a level: and by removing them apart, they would by degrees return to their original state, i. e. the diamond would recover, and the foil lose its lustre. See *DEFORMITY*.

BEAUTY of Christ's Person has been the subject of strong disputes in all ages of the church.—Isaiah describes the Messiah, as *without form and comeliness*, or any beauty to render him desirable. And the most ancient writers, as Justin Martyr, Clem. Alex. Origen, St. Cyril, Tertullian, &c. not only understand the prophet thus, but confess that the prophecy was literally fulfilled in the person of our Saviour. Tertullian says, that Christ was *ne aspectu quidem honestus*: de car, Christ. And Celsus brings this consideration as an argument against his divine office and mission.—But all this was afterwards denied by St. Jerom, and Chrysostom; who interpret the words of Isaiah, of the poverty and humility of the Messiah: and take the words of the Psalmist, *speciosus præ filiis hominum*; as meant of his personal form.—At length they began to magnify the external *beauty* of his body; and confined themselves to one kind of picture, with a zealous pretence of a likeness, which 800 years ago was known by none; every country having a several one. Whence that query of the Iconoclasts, which of those images or veronice was a true one? And well might they be unlike each other, since every nation painted our Saviour in the nearest resemblance to the make, air, &c. of the people of the country.

BECHICS*, **BECHICA**, **Βηχικα**, medicines proper for relieving coughs.

* The word is formed of the Greek, *βηχ*, *βηχ*, a cough.

Bechics amount to much the same with what we otherwise call *pneumonic*, *thoracic*, *expectorant*, and *pectorals*. See the articles *EXPECTORANT*, and *PECTORAL*.

BECHIC Pills. See the article *PILLULA*.

BED, a place prepared to stretch and compose the body on, for rest and sleep; made chiefly of feathers inclosed in a ticken case.

We say a feather *bed*, a down *bed*; a standing *bed*, a settee *bed*, a tent *bed*, a truckle *bed*, &c.

BED of State. See *PARADE*.

No *beds* are to be sold except filled with one sort of stuffing only; e. gr. feather *beds* with only dry pulled feathers; and down *beds* with clean down alone. No scalded feathers are to be mixed with the former; nor fen-down with the latter, on the pain of forfeiture; the mixture of such things being conceived as contagious for man's body to lie on. *Stat. 11. Hen. 7. c. 19.*

Also *bed-quits*, *matresses*, and cushions stuffed with horse-hair, fen-down, goats-hair, and neats-hair, which are dressed in lime; and which the heat of man's body will cause to exhale and yield a noxious smell, whereby many of the king's subjects have been destroyed—are prohibited by the same statute.

The ancient Romans had various kinds of *beds* for repose; as their *lectus cubicularis*, or *chamber-bed*, whereon they slept: their *table-bed*, or *lectus discubitorius*, whereon they eat (for they always eat lying) there being usually three persons to one *bed*, whereof the middle place was accounted the most honourable, as well as the *middle-bed*.—They had also their *lectus lucubratorius*, whereon they studied; and a *lectus funebriis*, or *emortalis*, whereon the dead were carried to the pile. See *FUNERAL*.

BED of a great gun is that thick plank which lies immediately under the piece; being, as it were, the body of the carriage.

BED, in gardening, a piece of made-ground, raised above the level of the adjoining ground, usually square or oblong, and enriched with dung or other amendments; intended for the raising of herbs, flowers, seeds, roots, or the like.

Hot-BED. See the article *Hot-Bed*.

BED, in masonry, denotes a course or range of stones. See *COURSE*.

Joint of the BED is the mortar between two stones placed over each other.

BEDS, in speaking of minerals and fossils, signify certain strata, or layers of matter disposed over each other. See *STRATA*.

BED-CHAMBER—*Lords or Gentlemen of the BED-CHAMBER* are persons of the first rank, ten in number; whose office is, each in his turn, to attend a week in the king's bed-chamber, lying by the king on a pallet-bed all night, and to wait on the king when he eats in private.

The first of these is called *groom of the stole*. See the article *STOLE*.

BED-MOULDING, or *BEDDING-moulding*, in architecture, is a term used by the workmen for those members in a cornice, which are placed below the corona or crown.

Abed-moulding usually consists of these four members, an O—G, a lift, a large boutine, and another lift under the coronet.

BEECH-Oil, an oil drawn from the fruit, or mast, of the beech-tree.

The *beech-mast* is a kind of triangular seed, in form of a nut, or rather acorn, containing a whitish, oleaginous pith, of a very agreeable taste; whereof is made an oil much valued for sallets, &c.

It is very common in Picardy, and other places, where the mast abounds. They draw it cold by expression, after the mast has been shelled, and ground or pounded.

An attempt was made, a few years ago, to introduce the manufacture of *beech-oil* in England, and a patent granted to the proprietor; but without success; the country people, it seems, turning their mast to better account in feeding the hogs with it, than in selling it to the patentee, and his co-proprietors, for oil.

BEDQUEENS. See *SCENITES*.

BEEN, or *BEHEN*, in pharmacy, denotes a medicinal root, celebrated, especially among the Arabs, for its aromatic, cardiac, and alexiterial virtues.

There are two kinds of *beens*, viz. the *white*, *been album*, which is insipid, making little impression on the tongue, besides that of a little bitterness which it leaves behind it, and supposed by some modern botanists to be the same with our *lychnis terrestris*, by others called the papaver spumeum.

Red been, *been rubrum*, is fibrous, brown without and reddish within; supposed to be the root of a species of limonium, or sea-lavender.

They are both brought from the Levant, and have much the same virtues, being substituted for each other; they must be chosen dry, and of an aromatic astringent taste.

BEER*, a popular drink, prepared from malt and hops.

* The word is Saxon, formed from the German *bier*, of the Latin *bibere*, sometimes written by apocope *biber*.

Mathiolus takes the *zythum* and *curmi* of the ancients to be the same with the *beer* and *ale* of our days; and thinks the only difference between *zythum* and *curmi*, to have lain in some circumstances of the preparation, which rendered the one stronger than the other.

Tacitus, in speaking of the ancient Germans, as also Dioscorides, Galen, &c. condemn *beer*, as prejudicial to the head, nerves, and membranous parts, as occasioning a more lasting and more uneasy drunkenness than wine, and as promoting a suppression of urine, and sometimes a leprosy.

Mess. Perrault, Rainfant, and others, defend the modern *beer*; urging, that the hops used with us, and which the ancients were strangers to, having a faculty of purifying the blood, and removing obstructions, serve as a corrective, and free our drink from the inconveniences laid at the door of that of the ancients.

For the manner of preparing *beer*, see *BREWING*.

For its qualities, see *MALT-LIQUOR*.

Eager BEER is used by calicoe-printers, chymists, lapidaries, scarlet-dyers, vinegar-merchants, white-lead-men, &c.

BEER-Measure. See the article *MEASURE*.

BEER-Vinegar. See *VINEGAR*.

BEE-S-WAX. See the article *WAX*.

BEGGAR. See *VAGABOND* and *ROGUE*.

BEGGING Orders. See *MENDICANT*.

BEGHARDI, *BEGUARDI*, or *BEGGHARDI*, the name of an heretical sect in Germany, which sprung up towards the end of the 13th century.—Their head was one Dulcinus. Their principal tenets were, That man, in this life, might be impeccable; and, that he might arrive to a degree of perfection not to be exceeded; that this state is as happy as heaven; which, when once obtained, men are no longer obliged to ob-

serve the facts of the church; nor obey their superiors; that every intellectual creature is self-happy; that it stands in need of nothing but the light of glory to raise it to the vision and enjoyment of God; that none, but the imperfect, apply themselves to pious virtuous actions; that Christ Jesus ought not to be adored in the elevation of the host, nor the mysteries of his incarnation be regarded: they condemned good works, and are said to have spread abroad divers impure doctrines. These fanatics, who wore the habit of monks, without paying regard to any rule, or observing celibacy, were condemned under pope Clement V. at the council of Vienne in 1311.

BEGINNING of an eclipse. } See *ECLIPSE*.

BEGINNING of the action. } See *ACTION*.

BEGLER BEG*, a Turkish title for the chief governor of a province, who has under him several beys or fangiacs, that is, sub-governors.

* The word is also written *beglerbey*, *beglerbey*, *begbiler begbi*, and *beglerbeg*.—It is compounded of *begler*, lords; the plural of *beg*, lord, with the word *beg* subjoined; importing as much as *lord of lords*.

BEGUARDI. See the article *BEGHARDI*.

BEGUINS, devout societies of young women, established in several parts of Flanders, Picardy, and Lorraine; who maintain themselves by the work of their own hands; leading a middle kind of life, between the secular and religious; but make no vows.

These societies began at Nivelles, in Flanders, A.D. 1226, and soon spread into France. Their habit was particular, but modest; they lived in common, and had men of great piety for their governors. Some of them giving into the errors of the Beghardi, and of Margaret Porreta, pope Clement V. abolished their institution; upon which they ceased in France; but John XXII. successor to Clement V. explained that decree, and declared only those societies of the *Beguins* extinct, which had fallen into heresy.

BEHEN. See the article *BEEN*.

BELAY, on board a ship, signifies the same as *fasten*.—Thus, they say, *belay the sheet*, or *tack*, that is, fasten it to the kennel, &c.

BELIEF, in its general and natural sense, denotes a persuasion, or a strong assent of the mind to the truth of any proposition.

In which sense *belief* has no relation to any particular kind of means or arguments, but may be produced by any means whatever.—Thus we are said to *believe* our senses, to *believe* our reason, to *believe* a witness, &c. And hence, in rhetoric, all sorts of proofs, from whatsoever topics deduced, are called *evidens*, because apt to beget *belief*, or persuasion touching the matter in hand.

BELIEF, in its more restrained and technical sense, invented by the schoolmen, denotes that kind of assent which is grounded only on the authority, or testimony of some person, or persons, asserting or attesting the truth of any matter proposed.

In this sense, *belief* stands opposed to knowledge and science: We do not say, we *believe* that snow is white, or that the whole is equal to its parts; but we see and know them to be so.—That the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things *credible*, but *scientific*; and the comprehension of such truths is not *belief*, but *science*.

But, when a thing propounded to us is neither apparent to our sense, nor evident to our understanding; neither certainly to be collected from any clear and necessary connexion with the cause from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding appears as true, not by a manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it;—This is said to be properly *credible*; and an assent to this, is the proper notion of *belief* or *faith*. See *FAITH*.

Bishop Pearson, with the generality of divines, holds the *belief* declared in the creed to be of this latter kind.—Dr. Barrow, on the contrary, contends for its being of the first or general and vulgar kind; implying, that we profess our being persuaded in our minds of the truth of the propositions annexed; not, upon one only kind of reason, viz. authority; but upon all the kinds of reason proper for begetting persuasion in the several points ensuing.—In effect, the word *veritas* is evidently used in scripture in this sense: as when Thomas is said “to have believed because he had seen,” where *belief* is grounded in sense.—Add, that our Saviour himself requires men not to rely merely on his bare testimony concerning himself, but to consider rationally the quality of his works, and on that to ground their faith: which kind of persuasion is grounded on principles of reason.—So St. James says, “the devils believe that there is a God.” But how? They know it by experience; not by any relation or testimony.—Add, that the *belief* of the first and main article, that there is a God, cannot be grounded only on authority: for human authority alone cannot prove such a point; and divine authority presupposes it.—To say no more: the faith of the first Christians does not seem to have been

been founded merely on authority; but relied partly on principles of reason, and partly on the attestations of sense: as they beheld the sincerity and innocence of our Saviour's conversation; the wisdom and majesty of his discourses; the goodness and holiness of his doctrine; the greatness of his power discovered in his miraculous works; these considerations had their weight as well as his own testimony. Nay, he seems to give up and disclaim all persuasion from his own testimony, as insufficient and sophistical. It was by the following syllogism, the people became *believers*: He that is so qualified (so speaks, acts, lives, so admirable in himself, so agreeable to ancient prophecies) his pretences cannot reasonably be deemed false, but we must of justice assent to his words: But, we see and experience that Jesus, &c. Ergo—With us the case is somewhat different. The minor proposition, which was evident from sense to the people of those times, is to be inferred from authority and reason by us, viz. from the credible histories of it still extant, confirmed by so constant a tradition, and maintained by such wonderful circumstances of providence, as perhaps never concurred to any matter of fact before.

BELCHING. See the article RUCTATION.

BELL, a popular machine, ranked by musicians among the number of musical instruments of percussion. See MUSIC. The parts of a *bell* are the body or barrel, the clapper within-side, and the ear or cannon, whereby it is hung to a large beam of wood.—Its usual matter is a kind of compound metal made of twenty pounds of pewter to an hundred of copper, called *bell-metal*. The thickness of its edges is usually $\frac{1}{2}$ of the diameter, and its height twelve times its thickness.—The bell-founders have a diapason, or bell-scale, wherewith they measure the size, thickness, weight, and tone of their bells.—For the method of casting bells, see FOUNDERY.

The uses of bells are summed up in the Latin distich:

*Laudo Deum verum, plebem voce, congrego clorum,
Defunctos ploro, pœnem fugo, festa decoro.*

The first bells are said to have been made at Nola; in Campania, wherof St. Paulinus was bishop; at least, it is assured, he was the first who brought them into use in the church. And hence, it is added, they had their Latin names, *nola* and *campana*: but others say, they take these names, not from their being invented in Campania, but because it was here the manner of hanging and ballancing them, now in use, was first practised; at least, that they were hung on the model of a sort of balance invented or used in Campania. For in Latin writers we find *campana flatera*, for a teetlyard, and in the Greek *κατακλις*, for ponderare, to weigh.

Polydore Virgil ascribes the invention of church bells to pope Sabinian, St. Gregory's successor; but by mistake: for St. Jerome, cotemporary with Paulinus, makes mention of one. In effect, pope Sabinian did not invent bells; but he was the first who appointed the canonical hours to be distinguished by them.

We even find mention made of bells in Ovid, Tibullus, Martial, Statius, Manilius, and the Greek authors, under the appellations of *tintinnabula*, and *sonando brasi*. Suetonius, Dion, Strabo, Polybius, Josephus, and others, mention them under the names of *petasus*, *tintinnabulum*, *arsamentum*, *crota-lam*, *signum*, &c. But these appear to have been no more than bangles, and little like the huge bells in use among us.

Hieronymus Magius, who has a treatise express on bells, (wrote, when in chains, in Turkey, and which is accounted very remarkable, purely from his memory, without the assistance of any books) makes large bells a modern invention. Indeed, we do not hear of any before the sixth century: in 610, we are told, Lupus, bishop of Orleans, being at Sens, then besieged by the army of Clotharius, frightened away the besiegers by ringing the bells of St. Stephen's.—The first large bells in England are mentioned by Bede towards the latter end of that century. They seem to have been pretty common in the year 816. The Greeks are usually said to have been unacquainted with them till the ninth century, when their construction was first taught them by a Venetian.

Indeed, it is not true, that the use of bells was entirely unknown in the ancient Eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his dissertation on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be disused among them, after the taking of Constantinople by the Turks; who, it seems, prohibited them, lest their sound should disturb the repose of souls, which, according to them, wander in the air. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in mount Athos.

F. Simon thinks the Turks rather prohibited the Christians the use of bells, out of political, than religious reasons; inasmuch, as the ringing of bells might serve as a signal for the execution of revolts, &c.

The city of Bourdeaux was deprived of its bells for rebellion; and, when it was offered to have them restored, the people refused it, after having tasted the ease and convenience of being freed from the constant din and jangling of bells.

Matthew Paris observes, that anciently the use of bells was prohibited in time of mourning; though, it is at, they make one of the principal ceremonies of mourning. He adds, that it was an ancient custom to ring the bells for persons about to expire, to advertise the people to pray for them; whence our *passing bells*.

Lobineau observes, that the custom of ringing bells, at the approach of thunder, is of some antiquity; but, that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church, to pray that the parish might be preserved from that terrible meteor.

The custom of christening, or blessing bells, is very ancient. Some say it was introduced by pope John XIII. in 972; but, it is evidently of an older standing; there being an express prohibition of the practice in a capitular of Charlemain in 789. Alcuin says, it was established long before the eighth century; so that what has been said of John XIII. is only to be understood of an order of that pope, for restoring the practice which had been disused. See *Hospitalum de Origine Templorum*, p. 113. where there is a particular account of all the ridiculous ceremonies practised about bells.

Nankin, a city of China, was anciently famous for the largeness of its bells; but their enormous weight having brought down the tower, in which they were hung, the whole building fell to ruin, and the bells have ever since lain on the ground.—One of these bells is near twelve English foot high, the diameter seven and an half, and its circumference twenty-three; its figure almost cylindric, except for a swelling in the middle; and the thickness of the metal about the edges, seven inches.—From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that of Erford, said by father Kircher to be the greatest bell in the world.—These bells were cast by the first emperor of the preceding dynasty, about 300 years ago. They have each their name, the hanger *tschou*, the eater *che*, the sleeper *chou*, the will *fi*.—Father le Comte adds, that there are seven other bells in Pekin, cast in the reign of Youlo, each of which weighs 120,000 pounds. But the founds even of their biggest bells, are very poor; being struck with a wooden in lieu of an iron clapper.

The Egyptians have none but wooden bells, except one brought by the Franks into the monastery of St. Anthony.

The sound of a bell arises from a vibratory motion of the parts thereof, much like that of a musical chord. The stroke of the clapper, it is evident, must change the figure of the bell, and of round make it oval: but the metal having a great degree of elasticity, that part which the stroke drove furthest from the centre will fly back again, and this even somewhat nearer to the centre than before: so that the two points which before were the extremes of the longer diameter, now become those of the shorter. Thus, the circumference of the bell undergoes alternate changes of figure, and by means thereof gives that tremulous motion to the air wherein sound consists. See SOUND.

M. Perrault maintains, that the sound of the same bell, or chord, is a compound of the sounds of the several parts thereof; so that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these sounds, as constitutes one uniform, smooth, even sound; and the contrary circumstances produce harshness. This he proves from the bells differing in tune according to the part you strike; and yet strike it any where, there is a motion of all the parts. He therefore considers bells as composed of an infinite number of rings; which, according to their different dimensions, have different tones, as chords of different lengths have: and, when struck, the vibrations of the parts immediately struck determine the tone; being supported by a sufficient number of consonant tones in the other parts.

Mr. Haukbee, and others, have found by experiment, that the sound of a bell struck under water is a fourth deeper than in the air: though Merfenne says, it is of the same pitch in both elements.

Bells are observed to be heard further, placed on plains, than on hills; and still further, in valleys, than on plains: the reason of which will not be difficult to assign, if it be considered, that the higher the sonorous body is, the rarer is the medium; consequently, the less impulse it receives, and the less proper vehicle it is to convey it to a distance.

BELLOWS, a machine used to give a brisk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inspiring the air by turns.

Bellows are of various kinds, as domestic bellows, enamellers' bellows, smiths' bellows, &c.

There are some bellows triangular, which only move on one side: others, called lantern-bellows, from their resembling a paper lantern: these move every way, and yet still continue parallel.

Mr. Triewald, engineer to his Swedish majesty, has contrived a kind of water-bellows.—This is not the first time that water

has

has been applied to blow the fire. The same is done at Tivoli, and in other parts of Italy, where the contrivances for this purpose are called *siffi d'acqua*.—*Vide Phil. Transf. No. 448. p. 234.*

The action and effect of *bellows* of every kind, whether leather or wooden, wrought by water or by men, depends on this, that the air which enters them, and which they contain when raised, is again compressed into a narrower space when they are closed. And, as the air, like all other fluids, runs to that place where it meets the least resistance, the air must of consequence fly out of the pipe or aperture with a velocity proportional to the force whereby the air is compressed, and must of consequence blow stronger or weaker, as the velocity with which the top and bottom of the *bellows* meet is greater or lesser. The blast also will last in proportion to the quantity of air that was drawn into the *bellows* through the valve or wind-clap.

The *Hessian bellows* are a contrivance for driving air into a mine for the respiration of the miners. This M. Papin improved, changing its cylindrical form into a spiral one; and, with this, working it only with his foot, he could make a wind to raise two pound weight.

The *bellows* of an organ are six foot long and four broad; each having an aperture of four inches, that the valve may play easily. There should likewise be a valve at the nose of the *bellows*, that one may not take the air from the other. To blow an organ of sixteen feet, there are required four pair of these *bellows*.

BELOMACY *, **BELOMANTIA**, a kind of divination by means of arrows, practised in the east, but chiefly among the Arabians.

* The word is of Greek origin; compounded of *βέλος*, arrow; and *μαντια*, divination.

Belomancy has been performed in different manners: one was to mark a parcel of arrows, and put eleven, or more of them, into a bag; these were afterwards drawn out, and according as they were marked, or not, they judged of future events.

Another way was to have three arrows, upon one of which was wrote, *God orders it me*; upon another, *God forbids it me*; and upon the third, nothing at all. These were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they consulted about was to be done; if it chanced to be that with the second inscription, it was let alone; and, if it proved that without inscription, they drew over again.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, *ch. xxi. 21.* At least St. Jerome understands it so, and observes that the practice was frequent among the Assyrians and Babylonians. Something like it is also mentioned in Hosea, *ch. iv.* only that *staves* are there mentioned instead of arrows, which is rather *rhabdomancy* than *belomancy*.—Grotius, as well as Jerome, confounds the two together, and shews that they prevailed much among the Magi, Chaldeans, and Scythians; whence they passed to the Slavonians, and thence to the Germans, whom Tacitus observes to make of *belomancy*.

BELTS, *Fascia*, in astronomy, two zones or girdles surrounding Jupiter's body, more lucid than the rest, and terminated by parallel lines; being sometimes broader and sometimes narrower, nor constantly taking up the same places in his disk.

BENCHERS, in an inn of court, the seniors of the house, who have the government and direction thereof; and out of whom is yearly chosen a treasurer, &c. See **INN**.

BEND, in heraldry, an ordinary, or bearing, formed by two lines, drawn diagonally, or a-thwart, from the upper part of the shield on the right, to the lower part on the left; being supposed to represent a shoulder-belt, or scarf worn over the shoulder.—See *Tab. Herald. fig. 7.*

The *bend* is one of the ten honourable ordinaries, containing a third part of the field when charged, and a fifth when plain.—It is sometimes indented, engrailed, &c.

Heralds speak of a *bend dexter*, and a *bend sinister*.

A *bend* is subdivided into a *benet*, or *bandelet*, which is the sixth part of the shield; a *garter*, which is the moiety of a *bend*; a *coft*, which is the fourth part of a *bend*; and a *ribband*, which is the moiety of a *coft*.

BEND dexter is that properly and absolutely called a *bend*, as above defined.—The word *dexter* is usually annexed to prevent mistakes, and distinguish it from the

BEND sinister, which is the same with what is otherwise called after the French heralds, a *bar*, *barre*. See the article **BAR**.

The *bend sinister* is subdivided into the *scarf*, or *scarpe*, and the *batton*; which latter is the fourth part of the *bend*, and the most usual mark of illegitimacy; but, then it never extends itself quite a-thwart the shield, but is cut off a little at each end.

When two frait lines drawn within the *bend* run nearly

parallel to the outward edges of it, this is called *voiding*; and, he that bears it, is said to bear a *bend voided*.

Party per BEND dexter. } See the article { **PARTY.**
Point in BEND. } **POINT.**

BENDING, in the sea language.—They say, *bend the cable*, when it is to be made fast to the ring of the anchor.—To *bend two cables*, signifies to tie them together with a knot, which, though less sure than splicing, is sooner done. To *unbend the cable*, is to loosen it from the ring of the anchor; which is done when a ship designs to be long at sea. To *bend a main sail*, is to make it fast to the yard in its proper place.

BENDS, in a ship, are the same with *wailes*, or *wales*, which are the outermost timbers of a ship, on which men set their feet in climbing up.

They are reckoned from the water, the *first*, *second*, and *third bend*: they help much to strengthen the ship, and have the beams, knees, and foot-hooks bolted into them.

BENDY, **BANDE**, in blazonry, denotes an escutcheon's being divided bend-wise into an even number of partitions.—If they be odd, the field must first be named and then the number of bends.

BENE. See the article **DE BENE esse**.

BENEDICTINS, or **BENEDICTIN order**, is an order of monks, who profess to follow the rule of St. Benedict.

The *Benedictins* are those properly called *monachi*, monks; the other orders are better denominated *friers*, or *religious*. In the canon law, the *Benedictins* are called *black monks*, being distinguished from the other orders by the colour of their habit; and not by the name of their patriarch, St. Benedict.—Among us they were formerly also denominated *black friers*. The *Benedictins* wear a loose black gown, with large wide sleeves, and a capuche on their heads, ending in a point behind.

The list of saints of the *Benedictin* order is very ample; but they are acculed by Baronius and many other writers, of putting many in the list who were never of the order. See **RELIGIOUS**.

BENEDICTUS carduus. See the article **CARDUUS**.

BENEDITTO sacco. See the article **SACCO**.

BENEFICE, **BENEFICIUM**, in an ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself, assigned to an ecclesiastical person for life, in return for his performing the service of the church.

All church-preferments, except bishoprics, are called *benefices*; and all *benefices* are, by the canonists, sometimes called *dignities*: but we now ordinarily distinguish between *benefice* and *dignity*, applying the word *dignity* to bishoprics, deanries, arch-deaconries and prebends; and *benefice* to parsonages, vicarages, and donatives.

The term *benefice* comes to us from the old Romans, who using to distribute part of the lands they had conquered on the frontiers of the empire, to their soldiers; those who enjoyed such rewards were called *beneficiarii*, and the lands themselves *beneficia*, as being held on the pure beneficence and liberality of the sovereign. These *benefices* at first were given for life only, but afterwards they became hereditary and patrimonial.

From the Romans, both the name and the thing passed into France and England, with this difference, as Mr. Blount observes, that *benefices* were not given as mere gratuities for past services, but as warrants for future ones, and were accordingly held by the tenure of serving, on occasion, in the wars, &c. So that what was before a *benefice*, became now converted into a *fee*. See **FREE**, and **SERVICE**.

Hence, doubtless, came the term *benefice* to be applied to church-livings; for, besides that the ecclesiastics held for life, like the soldiers, the riches of the church arose from the beneficence of princes.

As to the origin of ecclesiastical *benefices*, it is hard to determine when the revenues of the church were first divided: it is certain, till the fourth century, all the revenues were in the hands of the bishops, who distributed them by their oeconomy; they consisted principally in alms and voluntary contributions.—As the church came to have lands, parts thereof were assigned for the subsistence of the clerks, and called *benefices*; of which we find some footing in the fifth and sixth century: but then there does not appear to have been any certain partition, nor any precise quota allotted to each particular; but the allotments were absolutely discretionary till about the twelfth century.

At first, each was contented with a single *benefice*; but, pluralities were, by degrees, introduced, on pretence of equity: for, a single *benefice* being sometimes scarce thought a competency, the priest was allowed two: as his quality, or occasions, increased, so the number of *benefices* that were to support him were increased too. Hence some, affecting to equal princes in quality, pretend to revenues answerable thereto.

Vinc. Ferrier observes, that, in his time, there were five cases by which *benefices* were acquired : by the *nominative*, as in royal nominations ; by the *genitive*, as where the children of great men, &c. are provided of *benefices* by their birth ; by the *dative*, as when speaking of a *benefice*, it is said, *date, & debetur vobis* ; by the *accusative*, as where by virtue of an accusation, either true or false, an incumbent is dispossessed, and another admitted ; by the *ablative*, as when *benefices* are taken away by force from the poor and helpless : but the *vocative* case, which is the most just and legitimate, is out of use.—The *nominative* is for the king ; the *genitive* for the great ; the *dative* for the rich ; the *accusative* for the cunning ; and the *ablative* for the ambitious ; but the *vocative* is reserved for the Holy Ghost alone.

The canonists distinguish three manners of vacating a *benefice*, viz. *de jure*, *de facto*, and by the *sentence of a judge*.—A *benefice* is vacated *de jure*, when the person enjoying it is guilty of certain crimes expressed in those laws, as heresy, simony, &c.—A *benefice* is vacated *de facto*, as well as *de jure*, by the natural death, or the resignation of the incumbent : which resignation may be either express ; or tacit, as when he engages in a state, &c. inconsistent with it ; as among the Romanists by marrying, entering a religious order, or the like. A *benefice* becomes vacant by the *sentence of a judge*, by way of punishment for certain crimes, as concubinage, perjury, forcery, &c.

Benefices are divided by the canonists into *simple*, and *sacredotal* : in the first, there is no obligation but to read prayers, sing, &c.—Such are canonries, chaplainships, chantries, &c. The second are charged with a cure of souls, or the direction and guidance of consciences.—Such are vicarages, rectories, &c.

The Romanists, again, distinguish *benefices* into *regular* and *secular*.

Regular or *titular BENEFICES* are those held by a religious, or a regular, who has made profession of some religious order.—Such are abbies, priories conventual, &c.

Or rather, *regular benefice* is that which cannot be conferred on any but a religious ; either by its foundation, by the institution of some superior, or by prescription. For prescription, forty years possession by a religious, makes the *benefice* regular.

Secular BENEFICES are those which are only to be given to seculars.—Of which kind are almost all cures.

All *benefices* are reputed secular, till the contrary is made appear.—They are called *secular benefices*, because held by secular priests, i. e. by such as live in the world, and are not engaged in any monastic order.

Some *benefices*, regular in themselves, have been secularized by the pope's bull.

A *BENEFICE* in *commendam* is that, the direction and management whereof, upon a vacancy, is given or recommended to an ecclesiastic for a certain time, till it may be conveniently provided for. See REGULAR and SECULAR.

Possession of a BENEFICE. See POSSESSION.

BENEFICIO. See DEPRIVATIO a *beneficio*.

Suspensio a BENEFICIO.

Primo BENEFICIO ecclesiastico habendo. } See SUSPENSIO.

Secundo BENEFICIO ecclesiastico habendo. } See PRIMO.

BENEVOLENCE is used, both in our statutes and chronicles, for a voluntary gratuity given by the subjects to their sovereign, to which each person contributes in proportion to his estate.

In this sense, *benevolence* amounts to much the same with what in other nations is called *subsidiu charitativum*, given sometimes by tenants to their lords, by the clergy to their bishops, &c.—In France it is called *frée gift*, excepting that this latter is restrained to the act of the clergy.

BENZOIN, a medicinal kind of resin, imported from the kingdoms of Cochinchina, Laos, and several other parts of the East Indies.

Benzoin is the same with what is popularly called *benjamin*, or *benjoin*, sometimes also *asa dulcis*.

It is procured by a wound or incision made in a tree, whose leaves resemble those of the lemon-tree. It is of a yellowish colour, of an agreeable scent, and melts easily.

There are three sorts of *benzoin* :—the first is called *amygdaloides*, because of its being interspersed with several white spots, which resemble broken almonds : this comes from Siam, and is esteemed the best.—The second is black and very odoriferous ; it drops from young trees, and comes from Sumatra, it is called *benzoinum de Boninas*.—The third sort is also black, but less odoriferous ; this is found in the islands of Java and Sumatra.

Benzoin is used in physic, as a pectoral, and anti-asthmatic ; and thrown on live coals, it serves to perfume houses, &c.

BERENGARIANS, a religious sect, who adhered to the opinions of Berengarius, archdeacon of Anjou, who opposed the doctrine of transubstantiation and the real presence, a considerable time before Luther.

He is further charged by the Romanists with decrying marriage, and maintaining the common use of all sorts of women, and asserting infant-baptism of no effect.

His followers were divided on the head of the eucharist : Though they all agreed that the bread and wine were not ef-

fectually changed, yet some allowed that the body and blood of Christ were contained in them, though concealed under an impanation, which was the opinion of Berengarius himself : others denied any change at all, and received the whole into figure ; others again allowed a change in part ; and others an entire change, with this restriction, that to those who presented themselves unworthily it was changed back again.

BERENICE's hair, *coma BERENICES*. See COMA.

BERGAMOT gives the denomination to a kind of essence, drawn from a fruit, produced by ingrafting the lemon-tree on the *bergamot* pear-stock. It is properly the oily fluid of the peels of these lemons expressed by the fingers.

There is likewise a kind of snuff of the same name, which is only clean tobacco, with a little of the essence rubbed into it.

BERGHMOT*, or BERGHMOTE, vulgarly BARMOTE, a court held on a hill for deciding pleas and controversies among the Derbyshire miners.

* The word is formed from the Saxon *berg*, *mount* ; and *mote*, *convencium*, assembly or meeting.

BERLIN, a sort of vehicle, of the chariot-kind, much used of late ; taking its name from the city of Berlin in Germany : though some attribute the invention of it to the Italians, and derive the word from *berlina*, a name given by them to a sort of stage, whereon persons are exposed to public shame.

The *berlin* is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot.—The body of it is hung high on shafts by leathern braces ; there being a kind of stirrup or footstool for the convenience of getting into it : instead of side-windows, some have screens to let down in bad weather, and draw up in good.

BERME, in fortification, a small space of ground, four or five foot wide, left without the rampart, between its foot and the side of the moat ; to receive the earth that rolls down from the rampart, and prevent its falling into and filling up the moat.

This is also called *lisiere*, *relais*, *retraite*, *pas de fouris*, *foreland*, &c.

Sometimes, for more security, the *berme* is palisadoed.

BERNARDINES, or BERNARDITES, the name of a religious order extended over great part of Europe ; being an improvement on the order of St. Benedict, first made by Robert, abbot de Moleme ; and further reformed by St. Bernard, abbot de Clervaux, whence they take their name.

Their usual habit is a white gown, with a black scapulary ; but when they officiate, they put on a large white coull with great sleeves, and a hood of the same colour.

The *Bernardines* differ very little from the Cistercians. They had their origin towards the beginning of the twelfth century.

BERRY, *bacca*, a grain, fruit, or seed, produced by several herbs, trees, and shrubs, thence called *bacciferous*, for the conservation, and re-production of their kind. See BACCIFEROUS.

Berries are of various sizes, forms, properties, and uses, according to the plants whereon they grow.—Some are used in medicine, as juniper-berries, buckthorn-berries, &c.—Others in dying, as French or yellow berries, &c.

Avignon BERRY. } See the articles } AVIGNON.

Alc BERRY. } See the articles } ALC.

BERYL, or BERYLL, *Beryllus*, in the ancient physiology, denotes a transparent stone, or gem, brought from India, of a light, or pale green colour ; inasmuch, that some have represented it as of two colours, the one green, the other pale.

The *beryl* of the ancients is the same with what in latter times has been denominated *aqua marina*, by reason of its glaucous, or sea-green colour.

The *beryl* differs from the *chrysoberyl*, which is somewhat paler, and partakes more of the yellow ; and from the *chryso-prasus*, which partakes more of the green.

Some authors take the *beryl* to be the diamond of the ancients.

The *beryl* is sometimes found in pieces large enough to form fine vases. It is said there are many of these in Cambaya, Martaban, Pegu, and Ceylon.

The properties of the *beryl* were very wonderful in the opinion of the ancient naturalists ; they tell us, it kept people from falling into ambushes of enemies, excited courage in the fearful, and cured diseases of the eyes and stomach.—It does none of these things now ; because people are not simple enough to believe it has the virtue to do them. See SUPPLEMENT, article BERYLL.

BES, or BESSIS, an ancient Roman weight, containing two thirds of the *as* ; that is, eight *unciae*. See the article *AS*.

BESANT, BEZANT, BISANT, or BYZANT, a sort of coin struck at Byzantium, in the time of the Christian emperors.

The *besant* was pure gold, or twenty-four carats fine : but its value is not well agreed on.

Hence also the gold offered by the king at the altar, on festivals, is still called *besant*, or *bisant*.

BESSIS. See the article BES.

BESTAIL, or **BESTIAL**, in ancient statutes is used for cattle. 5 Ed. 3. c. 2.

BESTIARI, among the ancient Romans, those who were hired to combat with beasts, or those who were exposed to them, by sentence of law.

We usually distinguish two kinds of *bestiarii*: the first were those condemned to the beasts; either as being enemies taken prisoners, or as being slaves, and guilty of some enormous crime.—These were all exposed naked, and without defence to the beasts; nor did it aught avail to conquer and kill the beast, fresh ones being continually let loose on them, till they were dead.—But, it seldom happened that two were required for the same man; on the contrary, one beast frequently dispatched several men. Cicero mentions a lion, which alone dispatched two hundred *bestiarii*.—Those who succeeded the first were called *spidarii*, and the last *oxarii*; among the Romans, *meridiani*.

The Christians were *bestiarii* of this kind, even some of them who were Roman citizens; though it was the legal right of such to be exempt from it.

The second kind of *bestiarii*, Seneca observes, consisted of young men, who, to become expert in managing their arms, fought sometimes against beasts, and sometimes against one another; and of bravo's, who, to shew their courage and dexterity, exposed themselves to this dangerous combat. Augustus encouraged this practice in young men of the first rank; Nero exposed himself to it; and it was for the killing beasts in the amphitheatre, that Commodus acquired the title of the *Roman Hercules*.

Vigenero to these adds two kinds of *bestiarii* more: the first were those who made a trade of it, and fought for money; the second was where several *bestiarii* armed, were let loose at once against a number of beasts.

BEVEL, in masonry, and among joiners, a kind of square, one leg whereof is frequently flat, and the other crooked, according to the sweep of an arch or vault; being withal moveable, on a point, or centre, so that it may be set to any angle.

The make and use of the *bevel* are pretty much the same as those of the common square and mitre, except that these latter are fixed; the first at an angle of ninety degrees, and the second at forty-five; whereas the *bevel*, being moveable, may, in some measure, supply the office of both, and yet, which it is chiefly intended for, supply the deficiencies of both, serving to set off, or transfer, angles either greater or less than ninety or forty-five degrees.

BEVEL-angel is used among the workmen, to denote any other angle beside those of ninety or forty-five degrees. See **ANGLE**.

BEVILE, in heraldry, denotes a thing broken, or opening like a carpenter's rule.—Thus he beareth argent a chief *bevile* vert, by the name of *Beverlis*.—V. *Tab. Herald. fig. 8*.

BEY, or **Beg**, denotes a governor of a country or town in the Turkish empire.

The Turks write the word *begh*, or *bek*, but they pronounce it *bey*: properly it signifies *lord*, but is particularly applied to a *lord of a banner*, whom in the same language they call *sangiahbeg*, or *bey*; *sangiah*, which among them signifies *banner*, or *standard*, being the badge of him who commands in a considerable place of some province, having under him a considerable number of Spah's, or horse.

Each province in Turkey is divided into seven of these *sangiahs*, or banners, each of which qualifies a *bey*; and these are all commanded by the governor of the province, whom they also call *beghiler-beghi*, or *beyler-bey*, i. e. *lord of the lords* or *beys* of the province.

These *beys* are in a great measure the same that *bannerets* formerly were in England.

BEY, of Tunis, denotes a *prince*, or *king* thereof; answering to what at Algiers is called the *Dey*.

In the kingdom of Algiers, each province is governed by a *bey*, or *vice-roy*; who is appointed and removed at pleasure by the *dey*; but has a despotic power within his jurisdiction; and, at the seasons of collecting the tribute from the Arabs, is assisted by a body of troops from Algiers. *Shaw. Trav. p. 6*.

BEZANT. See the article **BESANT**.

BEZOAR*, or **BEZOARD**, primarily denotes an antidote, or counter-poison.

* The word is formed from the Persian *pa-zabar*, which denotes the fame; *pa*, signifying, against; and *zabar*, poison.

In this sense the name is applied to divers chymical compositions of that intention; as the mineral, solar, and jovial *bezoards*.

Some have also given the appellation *animal bezoard*, to a powder made of the heart and liver of vipers, pulverized together.

BEZOAR, or **BEZOARD**, in a more proper sense, denotes a medicinal stone, brought from the East or West-indies, composed of several coats laid one over another, generated in the stomach of an animal of the goat kind, and esteemed a powerful antidote and cardiac.—Or, it may be defined, a stony substance, taken out of the stomach of some animal, composed of several coats or laminae, like an onion, and endowed with a power of resisting poison.

This is sometimes also called the *true bezoar*; and is of two kinds, *oriental* and *occidental*.

Oriental BEZOAR is in the most esteem, and is brought from several parts of the East-Indies, chiefly Golconda and Cananor: it is there found mingled with the dung of an animal of the goat-kind called *panan*; in the belly whereof this stone is found.—The buds of a certain shrub which the animal uses to browse, are usually found in the middle of it, and are supposed to be the basis on which it is formed.

The *bezoar* ordinarily grows to the bigness of an acorn, sometimes of that of a pigeon's egg: it is composed of several shining skins, or coats, like an onion, sometimes of a blood-colour, sometimes a greenish yellow, a brownish red, and honey-colour.—The number of *bezoars* produced by each animal is various, some yielding one, two, &c. to six, and others none at all.

The larger the stone, the more valuable it is held; its price increasing like that of the diamond.—A stone of one ounce is sold in the Indies for 100 franks, and one of four ounces for 2000 livres.

Oriental Bezoar must be chose glossy, of a smell like that of ambergreece, smooth to the touch, and in large pieces; its figure is indifferent, its colour usually olive.

Bezoar is easily sophisticated, but the deceit is as easily discovered. The methods of proving it are, 1st, to steep it three or fours hours in lukewarm water; if the water be not tinged, nor the *bezoar* lose of its weight, it is pure. 2^{dly}, To try it with a sharp, red-hot iron; if it enters the stone, and the heat makes it fry and shiver, it is facitious. 3^{dly}, To rub it over a paper smeared with chalk, or quick-lime; if it leave a yellow teint on the former, or a green one on the latter, it is good.

Bezoar is given in vertigo's, epilepsies, palpitations of the heart, jaundice, colic, and so many other diseases, that were its real virtues answerable to its reputed ones, it were doubtless a *panacea*. Indeed, its rarity, and the peculiar manner of its formation, have contributed as much to its reputation, as any intrinsic worth. At present it begins to be prized less, and a great many able physicians discard it, as of no use or efficacy at all.

Occidental BEZOAR is heavier, more brittle, of a dirtier green colour, as also less glossy, and generally held much inferior in virtue to the oriental kind.—It is found in the belly of several animals, especially in Peru; as the guanaco's, jacho's, vicunna's, and taragua's; the *bezoar* of which last is the most esteemed, this animal being much like the goat that produces the oriental.—But, that of the first is more common, viz. the guanaco's, a creature about the size of a horse, by some described, as of a species between a camel and a wild goat.

In some, this stone is of the bigness of a nut, in others of a pullet's egg: in some it is oval, in others flat, in others round; it is usually of an ash-colour, sometimes dusky; and formed of scales, like the oriental, but much thicker: it is smooth and even without-side, but when broke, looks as if it had been sublimated, by reason of the little shining needles whereof it appears to be composed.

German BEZOAR, which some call *cow's egg*, is said to be found in the stomach of some cows, but more frequently in that of the chamois, a sort of rupicapra, or wild goat.

These *bezoars* are supposed to be nothing else but the hair of those animals, which being occasionally licked off by the tongue, is swallowed down, and being impregnated with the saliva, &c. is condensed into balls.

Some of them weigh 18 ounces, but they are not much esteemed, though they are used in some medicines, and by the painters in miniature, to make a yellow colour.

Besides these three kinds of *bezoar* which the shops afford, there are three other kinds much rarer, viz. the

Hog or Boar BEZOAR, called by the Dutch, *pedra de porco*, and by the Portuguese, who first brought it into Europe, *pedra de vaparis*, found in the gall-bladder of a boar in the East-Indies.

In figure and size it resembles a filbert, though more irregular; its colour not fixed, but most commonly white with a teint of blue; it is smooth and shining; and is valued at ten times its weight in gold.

The Indians attribute infinite virtues to this *bezoar*: they call it *massica de jozo*, and prefer it to the *goat-bezoar*; not so much on account of its being supposed the best preservative in the world against poisons, as on account of its being sovereign in the cure of the mardoxi, a disease they are very liable to, and which is not less dangerous than the plague in Europe.

Other properties which they ascribe to it are, that it is admirable against malignant fevers, small-pox, and most diseases of women not with child; experience shewing, that it promotes abortion in those who are, if they use it indiscreetly.

To use it, they infuse it in water, or wine, till it has communicated a little bitterness to it. To facilitate the infusion, and at the same time preserve so precious a stone, they usually set it in a gold case pierced with holes.

Porcupine and Monkey BEZOARS only differ from those of the hog, in that they are found in the gall-bladders of those animals; unless we say with Tavernier, that these two, which he

calls *Malacca-stones*, are not taken from the gall-bladders, but from the heads of the monkey and porcupine; and that they are held in such esteem by the natives of Malacca, that they never part with them, unless as presents to ambassadors, or the greatest princes of the east.

Some add, that they are likewise found in Siam.—Indeed, the form, colour, and properties of these three *bezoars* are so near a-kin, that it is more than probable, they are all the same stone under three different names.

BEZOARDICUM Minerale, or *Mineral Bezoar*, is a preparation of antimony corrected with spirit of nitre, and softened by repeated lotions, which carry off the purgative virtue, and substitute a diaphoretic one; by which it promotes sweat, like the stone of that name.

BEZOARDICUM Joviale, or *Bezoar of Jupiter*, is a regulus made by melting three ounces of regulus of antimony and two of black-tin, which, powdered and mixed with six ounces of corrosive sublimate, and distilled off in a kind of butter, and that dissolved in spirit of nitre, and the solution distilled three times; the *bezoar* remaining at bottom is to be powdered, washed, and mingled with spirit of wine, till it grow insipid.

BEZOARDICUM Lunale, or *of silver*, is made by mixing rectified butter of antimony with fine silver, dissolved in spirit of nitre, upon which, a powder falls to the bottom, which is the *bezoar*.

BEZOARDICUM Martiale, is a dissolution of crocus martis by reverberation in butter of antimony, with spirit of nitre poured on it: commended by some against hysterical, hypochondriacal, and icterical disorders.

BATHANATI, ΒΙΑΘΑΝΑΤΟΙ*, the same with suicides, or those who kill themselves.

* Dr. Domes, dean of St. Paul's, has a work under the title of *Bathanatus*: wherein he undertakes to prove this position, or paradox:—That suicide is not so naturally sin, as that it may never be otherwise. Lond. 4to.

BIBERE ad pinas. See the article PINNAS.

BIBITORY Musica. See ADDUCTOR Oculi.

BIBLE, a book, by way of eminence so called, containing the scriptures, i.e. the writings of the old and new testament.

Bibles are distinguished, according to their language, into Hebrew, Greek, Latin, Chaldee, Syriac, Arabic, Coptic, &c. Some account of each whereof, and their several editions, &c. we shall here subjoin.

Hebrew Bibles are either manuscript, or printed.—The best manuscript *bibles* are those copied by the Jews of Spain. Those copied by the Jews of Germany are less exact, but more common. The two kinds are easily distinguished from each other; the former being in beautiful characters, like the *Hebrew bibles* of Bomberg, Stephens and Plantin; the latter in characters, like those of Munster and Gryphius.—F. Simon observes, that the oldest manuscript *Hebrew bible* are not above 6 or 700 years old; nor does Rabbi Menaham, who quotes a vast number of them, pretend any of them exceed 600 years.

The most ancient printed *Hebrew bibles* are those published by the Jews of Italy, especially of Pesaro and Bresle. Those of Portugal also printed some parts of the *bible* at Lisbon, before their expulsion.—This may be observed in the general, that the best *Hebrew bibles* are those printed under the inspection of the Jews; there being so many minutiae to be observed, that it is scarce possible for any other to succeed in it.

In the beginning of the sixth century Dan. Bomberg printed several *Hebrew bibles* in folio and quarto at Venice, most of which are esteemed both by the Jews and Christians: the first in 1517, which is the least exact, and generally goes by the name of Felix Pratensis, the person who revised it: the second in 1526, with the massora, and the commentaries of several rabbins, and a Hebrew preface by Rabbi J. Benchajim.—In 1548, the same Bomberg printed the *folio bible* of Rabbi Benchajim, which is the best and most perfect of them all: it is distinguished from the first of the same rabbi, by the comment of Rabbi D. Kimchi on the chronicles, which is not in the preceding. From this edition it was, that Buxtorf, the father, printed his rabbinical *Hebrew bible* at Basil, in 1618; but in this are several faults, especially in the commentaries of the rabbins, where that learned man altered some places that were against the Christians.—In the same year appeared at Venice a new edition of the rabbinical *bible* by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former edition; but, besides that it is much inferior to the other *Hebrew bibles* of Venice, with regard to paper and print, it has passed through the hands of the inquisitors, who have altered many passages in the commentaries of the rabbins.

For *Hebrew bibles* in 4to, that of R. Stephens is esteemed for the beauty of the characters; but it is very incorrect. Plantin also printed several beautiful *Hebrew bibles* at Antwerp; the best is that of 1566, in 4to. Manasseh Ben Israel, a learned Portuguese Jew, published two editions of the *Hebrew bible* at Amsterdam, the one in 4to, the other in 8vo; the first has two columns, and for that reason is commodious for the reader. In 1634, R. J. C. Lombroso published a new edition in 4to at Venice, with small literal notes at the bot-

tom of each page, where he explains the Hebrew words by Spanish words. This *bible* is much esteemed by the Jews at Constantinople: in the text they have distinguished between words where the point camets is to be read with a camets-hatuph, that is by o and not an a.

Of all the editions of the *Hebrew bible* in 8vo, the most beautiful and correct are the two of Jo. Athias, a Jew of Amsterdam. The first, of 1661, is the best paper; but that of 1667, is the most exact: that, however, published since at Amsterdam by Vander Hooght 1705, is preferable to any of them.

After Athias, three Hebraising Protestants engaged themselves in revising and publishing the *Hebrew bible*, viz. Clodius, Jablonski, and Opius.—Clodius's edition was published at Frankfort, in 1677, in 4to. At the bottom of the page it has the various readings of the former editions; but the author does not appear sufficiently versed in the accenting, especially in the poetical books; besides, that not being published under his eye, many faults have crept in.—That of Jablonski in 1699, in 4to, at Berlin, is very beautiful as to letter and print: but, though the editor pretends he made use of the editions of Athias and Clodius, some critics find it scarce in any thing different from the 4to edition of Bomberg.—That of Opius is also in 4to, at Keil, in 1709; the character is large and good, but the paper bad: It is done with a great deal of care; but the editor made use of no manuscripts but those of the German libraries; neglecting the French ones, which is an omission common to all three.—They have this advantage however, that besides the divisions used by the Jews, both general and particular, into parafkes and pesukim, they have also those of the Christians, or of the Latin *bibles*, into chapters and verses; the keri ketib, or various readings, Latin summaries, &c. which make them of considerable use, with respect to the Latin editions and the concordances.

The little *bible* of R. Stephens in 16to, is very much prized for the beauty of the character. Care, however, must be taken; there being another edition of Geneva, exceedingly like it, excepting, that the print is worse, and the text less correct.—To these may be added some other *Hebrew bibles* without points, in 8vo and 24to which are much coveted by the Jews; not that they are more exact, but more portable than the rest; and are used in their synagogues and schools: of these there are two beautiful editions, the one of Plantin, in 8vo, with two columns, and the other in 24to, reprinted by Raphalengius at Leiden, in 1610. There is also an edition of them by Laurens at Amsterdam, in 1631, in a larger character: and another in 12mo, at Frankfort, in 1694, full of faults, with a preface of M. Leusden at the head of it.

Greek Bibles.—There are a great number of editions of the *bible* in Greek; but they may be all reduced to three or four principal ones, viz. that of Complutum, or Alcalá de Henares, that of Venice, that of Rome, and that of Oxford.—The first was published in 1515 by Cardinal Ximenes, and inserted in the polyglot *bible*, usually called the Complutensian *bible*: this edition is not just, the Greek of the Seventy being altered in many places according to the Hebrew text. It has, however, been reprinted in the Polyglot *bible* of Antwerp, in that of Paris, and in the 4to *bible* commonly called *bible of Vatable*.

The second *Greek bible* is that of Venice in 1518. Here the Greek text of the Septuagint is reprinted just as it stood in the manuscript, full of faults of the copists, but easily amended.

—This edition has been reprinted at Strasbourg, Basil, Frankfurt, and other places, with some alterations to bring it nearer the Hebrew. The most commodious is that of Frankfurt; there being added to this, little scholia, where are shewn the different interpretations of the old Greek translators: the author of this collection has not added his name; but it is commonly ascribed to Junius.

The third *Greek bible* is that of Rome in 1587, with Greek scholia collected from the manuscripts in the Roman libraries by Pet. Morin. This fine edition has been reprinted at Paris in 1628, by J. Morin, priest of the oratory, who has added the Latin translation, which in the Roman was printed separately, with scholia.—The Greek edition of Rome has been printed in the Polyglot *bible* of London; to which are added, at bottom, the various readings of the Alexandrian manuscript. This has been also reprinted in England in 4to and 12mo, with some alterations. It has been again published at Francker in 1709, by Bos, who has added all the various readings he could find.

The fourth *Greek bible* is that done from the Alexandrian manuscript, begun at Oxford by Dr. Grabe in 1707. In this the Alexandrian manuscript is not printed such as it is, but such as it was thought it should be, i.e. it is altered wherever there appeared any fault of the copists, or any word inserted from any particular dialect: this, some think a piece of merit, but others a fault; urging, that the manuscript should have been given absolutely and entirely of itself, and all conjectures, as to the readings, have been thrown into the notes. See SEPTUAGINT.

Latin Bibles, how numerous soever, may be all reduced to three classes, viz. the *antient vulgate*, translated from the Greek

Greek Septuagint: the *modern vulgate*, the greatest part of which is done from the Hebrew text; and the *new Latin translations*, done also from the Hebrew text in the 16th century.—We have nothing remaining of the ancient vulgate used in the primitive times in the Western churches; but the *Palms*, *Wisdom*, and *Ecclesiastes*. Nobilius has endeavoured to retrieve it from the works of the ancient Latin fathers; but it was impossible to do it exactly, in regard most of the fathers did not keep close to it in their citations. See *VULGATE*.

As to the *modern vulgate*, there are a vast number of editions very different from each other. Cardinal Ximenes has inserted one in the *bible* of Complutum, corrected and altered in many places. R. Stephens, and the doctors of Louvain, have taken a world of pains in correcting the *modern vulgate*. The best edition of Stephens's *Latin bible* is that of 1540, reprinted in 1545; in which are added, on the margin, the various readings of several Latin manuscripts, which he had consulted. The doctors of Louvain revised the *modern vulgate* after R. Stephens; and added the various readings of several Latin manuscripts. The best of the Louvain editions are those, at the end of which are added the critical notes of Francis Lucas of Bruges.

All these reformations of the *Latin bible* were made before the time of Pope Sixtus V. and Clement VIII. Since which, people have not dared to make any alterations, excepting in comments, and separate notes. The correction of Clement VIII. in 1592, is now the standard throughout all the Roman churches: that Pontiff made two reformations; but it is the first of them that is followed. From this the *bibles* of Plantin were done, and from those of Plantin all the rest; so that the common *bibles* have none of the after-corrections of the same Clement VIII.—It is a heavy charge that lies on the editions of Pope Clement, viz. that they have some new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine: witness that celebrated passage of St. John, *tres sunt*, &c.

There are a great number of *Latin bibles* of the third class, comprehending the versions from the originals of the sacred books made within these 200 years.—The first is that of Santes Pagninus, a Dominican, printed at Lyons in 4to, in 1528, much esteemed by the Jews. This the author improved in a second edition. In 1542, there was a beautiful edition of the same at Lyons in folio, with scholia, published under the name of Michael Villanovanus, i. e. Michael Servetus, author of the scholia. Those of Zurich have likewise published an edition of Pagninus's *bible* in 4to. And R. Stephens reprinted it in folio, with the vulgate, in 1557, pretending to give it more correct than in the former editions. There is also another edition of 1586, in four columns, under the name of Vatable: And we find it again in the Hamburg edition of the *bible* in four languages.

In the number of *Latin bibles* is also usually ranked the version of the same Pagninus corrected, or rather rendered literal, by Arias Montanus; which correction being approved of by the doctors of Louvain, &c. was inserted in the polyglot *bible* of Philip II. and since in that of London. There have been various editions of this in folio, 4to and 8vo; to which have been added the Hebrew text of the old testament, and the Greek of the new. The best of them all is the first, which is in folio, 1571.

Since the reformation, there have been several Latin versions of the *bible* from the originals, by Protestants. The most esteemed are those of Munster, Leo Juda, Castalio, and Tremellius: the three last whereof have been reprinted various times.—Castalio's fine Latin pleases most people; but there are some who think it too much affected: the best edition thereof is that in 1573. Leo Juda's version, altered a little by the divines of Salamanca, was added to the ancient Latin edition, as published by R. Stephens with notes, under the name of Vatable. That of Junius and Tremellius is preferred, especially by the Calvinists, and has undergone a great number of editions.

One may add a fourth class of *Latin bibles*, comprehending the Vulgate edition corrected from the originals. The *bible* of Hieronymus Clarus is of this number: that author not being contented with restoring the ancient Latin copy, has corrected the translator in a great number of places, which he thought ill rendered. Some Protestants have followed the same method; and, among others, Andrew and Luke Osiander, who have each published a new edition of the Vulgate, corrected from the originals.

Oriental Bibles.—At the head of the Oriental versions of the *bible* must be placed the Samaritan; as being the most ancient of all, and admitting no more for holy scripture but the Pentateuch, or five books of Moses.—This translation is made from the Samaritan Hebrew text, which is a little different from the Hebrew text of the Jews. This version has never been printed alone; nor any where but in the Polyglots of London and Paris.

Chaldee Bibles are only the glosses or expositions made by the Jews in the time when they spoke the Chaldee tongue. These they call by the name of *Targumim*, or *paraphrases*, as not being any strict versions of the scripture. They have

been inserted entire in the large Hebrew *bibles* of Venice and Basil; but are read more commodiously in the Polyglots, being there attended with a Latin translation.

Syriac Bibles.—In the year 1562, Widmanstadius printed the whole New Testament in Syriac at Vienna, in a beautiful character: After him there were several other editions; and it was inserted in the *bible* of Philip II. with a Latin translation. Gabriel Sionita also published a beautiful Syriac edition of the *Palms* at Paris in 1525, with a Latin interpretation. The whole *bible* is printed in Syriac in the Polyglots of London and Paris.

Arabic Bibles.—In the year 1516, Aug. Justinian, bishop of Nebio, printed at Genoa an Arabic version of the *Psalter*, with the Hebrew text and Chaldee paraphrase, adding Latin interpretations. There are also Arabic versions of the whole scriptures in the Polyglots of London and Paris; and we have an edition of the Old Testament entire, printed at Rome in 1671, by order of the congregation of *propaganda fide*; but it is of little esteem, as having been altered agreeably to the Vulgate edition. The *Arabic bibles* among us, are not the same with those used with the Christians in the East.—Some learned men take the Arabic version in the Old Testament, printed in the Polyglots, to be that of Saadias; at least in the main. Their reason is, that Aben Ezra, a great antagonist of Saadias, quotes some passages of his version, which are the same with those in the Arabic version of the Polyglots; yet others are of opinion, that Saadias's version is not extant. In 1622, Erpenius printed an Arabic Pentateuch, called also the Pentateuch of Mauritania, as being made by the Jews of Barbary, and for their use. This version is very literal, and esteemed very exact. The four Evangelists have also been published in Arabic, with a Latin version, at Rome in 1591, folio. These have been since reprinted in the Polyglots of London and Paris, with some little alterations of Gabriel Sionita. Erpenius published an Arabic New Testament, entire, as he found it in his manuscript copy, at Leyden, in 1616.

Coptic Bibles.—We have no part of the *bible* printed in Coptic, but there are several manuscript copies in some of the great libraries, especially in that of the French king.

Ethiopic Bibles.—The Ethiopians have also translated the *bible* into their language. There have been printed separately, the *Palms*, *Canticles*, some chapters of Genesis, Ruth, Joel, Jonah, Zephaniah, Malachi, and the New Testament; all which have been since reprinted in the Polyglot of London.—For the *Ethiopic New Testament*, which was first printed at Rome in 1548, it is a very inaccurate work, and is reprinted in the English Polyglot with all its faults.

Armenian Bibles.—There is a very ancient Armenian version of all the *bible*, done from the Greek of the Seventy, by some of their doctors about the time of St. Chrysostom. This was first printed entire in 1664, by one of their bishops at Amsterdam in 4to; with the New Testament in 8vo.

Persian Bibles.—Some of the fathers seem to say, that all the scripture was formerly translated into the language of the Persians; but we have nothing now remaining of the ancient version, which was, doubtless, done from the Septuagint. The Persian Pentateuch printed in the London Polyglot is, doubtless, the work of Rabbi Jacob, a Persian Jew. In the same Polyglot we have likewise the four Evangelists in Persian, with a Latin translation; but this appears very modern, incorrect, and of little use.

Gothic Bibles. It is generally said, that Ulphilas, a Gothic bishop, who lived in the fourth century, made a version of the whole *bible*, excepting the book of Kings, for the use of his country-men. That book he omitted, by reason of the frequent mention of the wars therein; as fearing to inspire too much of the military genius into that people. We have nothing remaining of this version, but the Four Evangelists, printed in 4to at Dort in 1665, from a very ancient MS.

Muscovite Bibles. An entire *bible*, in the Slavonic tongue, was printed at Ostravia in Volhinia, in the year 1581; and this is what we commonly the *Muscovite bible*. It was printed at the expence of Con. Basil, duke of Ostravia, for the common service of all Christians who spoke the Slavonic language, whereof the Muscovitish is a dialect.

Bibles in the vulgar tongues are too numerous to be here rehearsed. See F. Simon's *Critical History*, Le Long's *Bibliotheca Sacra*, and the *Bibliotheca Sacra* of F. Calmet, annexed to his dictionary of the *bible*.

BICEPS, in anatomy, is a name common to several muscles, from their having two heads.—Such is the

Biceps cubiti, or *bumeri*, a muscle of the arm, one of whose heads arises from the upper edge of the cavity of the head of the scapula, and is round and tendinous, and inclosed in the channel in the head of the humerus: the other arising from the processus coracoides, is broad and tendinous: and both unite about the middle and fore-part of the arm, and make one belly, which is inserted by a strong and round tendon into the tuberosity at the upper end of the radius.—See *Tab. Anat. (Myol.) fig. 1. n. 24. fig. 2. n. 20. fig. 6. n. 15.*

Some

Some of the fibres of the tendon form a large and thin aponeurosis, which covers all the muscles of the radius and fingers externally.—Care ought to be taken in blood-letting, not to cut a-crofs, but, according to the length of the fibres of this aponeurosis.—This muscle, with the brachizus internus, bends the arm.

Biceps Externus, called also *gemellus*. See **GEMELLUS**.

Biceps Tibia, or *Femoris*, a muscle of the leg with two heads; the one coming from the tuberosity of the ischium, and the other from the lower part of the femur: both which join together, and are inserted by one tendon into the superior and external part of the perone.—Its use is to help to bend the tibia, and is likewise employed in turning the leg, together with the foot and toes, outward, when we sit down.—See *Tab. Anat. (Myol.) fig. 6. n. 40.*

BIDENTALES, priests among the ancient Romans, instituted for the performance of the ceremonies of a *bidental*. The *bidentales* constituted a college or decury, who had the service and procuration, or interpretation of thunder and lightning.

The first and principal part of their office was the sacrificing a sheep of two years old, which in their language was called *biden*, as having only two teeth, one on each side; or rather from *bidenis*, anciently written for *biennis*, two years old.

BIGAS*, a chariot for racing, drawn by two horses abreast.

* The word ought rather to be written *bige*, in the plural; *q. d. bigae*, two horses being joined by a *jugum*, or yoke.

Bige stand contradistinguished from *trigae*, *quadrigae*, &c. *Bige* are of very ancient standing: all the heroes in Homer, Hesiod, Virgil, &c. fought in them.

BIGAMY, a double marriage, or the possession of two wives at the same time.

Among the ancient Romans, those convicted of *bigamy* were branded with a note of ignominy; and, in France, they were anciently punished with death.

BIGAMY, in the canon law, is also where a person either marries two women successively; or only marries one woman who had been married before.—Each of which the canonists account impediments to be a clerk, or to hold a bishopric without a dispensation: a point of discipline founded on that of St. Paul, *Let a bishop be the husband of one wife*, 1 Tim. iii. 2. Apoc. Const. 17. 18.

Bigamy they make of two kinds—*real*, as where the party actually marries twice—and *interpretative*, where he marries a widow, or woman debauched before, which is esteemed a kind of second marriage.

Here, F. Doucine distinguishes, and observes, that Irenæus having been married twice, must in this sense have been guilty of *bigamy*, and therefore have been made bishop of Tyre contrary to the canons. He therefore thinks with St. Jerom, &c. that those only who married two wives after baptism, came under the incapacity of *bigamy*: but St. Ambrose, Augustin, &c. are express, that it is *bigamy*, whether the first wife were married before, or after baptism. *Hist. du Nestor.*

The Romanists make a third kind of *bigamy*, by *interpretation*; as, when a person in holy orders, or that has taken on him some monastic order, marries.—This the bishop can dispense withal, at least on some occasions.

There is also a kind of *spiritual bigamy*; as, when a person holds two incompatible benefices, *v. gr.* two bishoprics, two vicarages, two canopies *sub eodem testis*, &c.

BIGNESS. See the article **MAGNITUDE**.

BIGOT*, a person foolishly obstinate, or perversely wedded to an opinion.

* The word comes from the German *boy*, and *Gott*, or the English *by-God*.

Camden relates, that the Normans were first called *bigots*, on occasion of their duke Rollo, who receiving Giffa, daughter of king Charles, in marriage, and with her the investiture of the dukedom, refused to kiss the king's foot in token of subjection, unless he would hold it out for that purpose: and being urged to it by those present, answered hastily, *No by God*; whereupon the king turning about, called him *bigot*; which name passed from him to his people.

BILARIUS *porus*, **BILARY** *poræ*, or *hepatic ducts*, a considerable appendage of the liver, formed from the concurrence of a multitude of small ramifications springing from the glands of the liver, which unite into several trunks equal in magnitude to the branches of the hepatic arteries; and accompany them branch for branch through the whole substance of the liver; being wrapped up in the same capsula with the porta. See *Tab. Anat. (Spanch.) fig. 5. lit. ff.* See also **PORUS**.

These branches are about the size of a wheat-straw, the biggest large enough to admit the little finger; and are distinguishable from the porta by their contents, being always full of bile. Besides, the capsula common to these and the porta, each has a thick white coat proper to itself, like the muscular coat of an artery.

On the concave side of the liver the several ramifications meet, and form one trunk, or channel, properly called the *bilary poræ*, about the bigness of a goose-quill, which descending about two inches, meets with the cystic duct, and together with it forms what we call the *ductus communis*; which

descending in a right line, about four inches, discharges itself into the duodenum, by an oblique insertion, oftentimes at the same aperture with the pancreatic duct.

The *porus bilarius* communicates with the gall-bladder, by a duct first described by Dr. Glisson, and afterwards by Blaius and Perrault, who gave it the name of the *cyst-hepatic duct*. Verheyen, in oxen, found two, three, or four of these cyst-hepatic ducts; and the like has been observed in a dog and a man.

BILAWS, or **BILAWES**. See the article **BY-LAWS**.

BILDGE, or **BILGE** of a ship, denotes the bottom of her floor; or the breadth of that part which she rests on, when she is a-ground.

BILDGE-water is that, which, by reason of the flatness of the ships bottom, lies on her floor, and cannot go to the well of the pump.

The Dutch, whose ships are often of this form, use a sort of pumps called *bilge-pumps*; or, as we call them, *burp-pumps*, to carry off the *bilge-water*.

When a ship strikes on a rock, they also say, she is *bilged*, or *bulged*.

BILE*, **BILIS**, a yellow bitter juice, separated from the blood in the liver, collected in the *porus bilarius*, and gall-bladder, and thence discharged by the common duct into the duodenum.

* The word *bile* comes from the Latin *bili*, which some fetch further from the Greek *βίαι*, violence; because bilious people are inclined to anger: others derive it from the Latin *bullire*, to boil.

Bile is of two kinds, *hepatic* and *cystic*.—The first, most properly called *bile*, is separated immediately from the glands of the liver into the *porus bilarius*.—The second, more properly called *gall*, is separated likewise from the glands of the liver into the gall-bladder, by roots or ducts proper to itself.

The *cystic bile* is thicker, of a deeper yellow, and bitterer; is not evacuated continually, but only when its receptacle is replete; in which case the contraction of the irritated fibres propels it into the duodenum.—The *hepatic bile* is greener, thinner, more mild and pellucid, and is continually oozing out; being expelled by the sole action of the neighbouring parts. The *cystic bile* resists acids, and, mixed with other fluids, gives them the like property: it absterges like soap, and renders oils capable of mixing with water; it resolves and attenuates resins, gums, and other tenacious bodies, rendering them homogeneal to itself. It is neither alicious nor acid, but seems a concretion of oil, salt, and spirits diluted with water.—By a chymical analysis, Dr. Drake observes, it affords some sulphur, or oil, some volatile salt, a good deal of fixt salt, (in which particular it differs from all other animal liquors) and a moderate quantity of caput mortuum, or earth: the basis is phlegm.

The principal use and effect of the *bile* is, by mixing with the chyle and the fæces, to attenuate, resolve, absterge, and stimulate the fibre motrices of the intestines; as, also to mix together things very different, to bruise and blunt those that are sharp and saline, to divide those that are coagulated, to open the passages for the chyle, to excite appetite, to act the part of a ferment, and to assimilate crude things to things concocted.—These effects the *cystic bile* has in a greater, the *hepatic* in a lesser degree.

Dr. Quincy thinks the principal use of both sorts of *bile* is to sheath and blunt the acids of the chyle, entangling them with its sulphur, so as to prevent their being sufficiently diluted by the pancreatic juice to enter the lacteals: which seems confirmed by this, that notwithstanding the great quantity of acid salts in the aliment in the stomach, there are never any found in the chyle after it has passed the *duodenum*, and been impregnated with the *bile* continually oozing out of the *porus bilarius*. See **ACID** and **BLOOD**.

Borelli asserts, that part of the *bile* discharged into the intestines re-enters the meseraic veins, and mixing with the blood of the vena porta is again percolated through the liver; and Boerhaave seems of the same opinion: on which footing the *bile* has its circulation, as well as the blood.

Some will have the *cystic bile* brought to its receptacle three different ways, and that it is even composed of three different kinds of *bile*, whence its different properties.—Though Boerhaave takes those properties rather to result from its flagging in the gall-bladder; and, with Malpighi, thinks the bitter part may probably become so in the glands between the coats of the gall-bladder, which are furnished from the cystic arteries; whence it proceeds bitter, and mixes with the rest in the bladder.

The *bile* is a juice of great importance, with regard to the good or ill habitude of the animal. Dr. Woodward has traced its effects throughout the body very minutely, and makes no scruple to ascribe most of the diseases thereof to some disorder of the *bile*. This he takes to be the chief spring in the animal machine, and from this accounts for most of the phenomena of a body, whether healthy or diseased: and yet the ancients generally took it to be no more than an excrement, for which they could not find any use.

Many of the moderns, from the small quantity of *bile* secreted, have been led into a mistake, that this secretion is

not the sole end of so considerable a viscus as the liver. Dr. Keil observes, that in a dog whose common duct was near as big as that of a man, he gathered at the rate of about two drams an hour; though in a human body, there is reason to think the quantity secreted to be greater.

The *bile* is a part found in all animals: even pigeons, &c. which have no gall-bladder, yet have *bile*; their liver being found very bitter. Mr. Taubry observes, that the *bile* becomes one of the principal causes of thirst, by mixing with the salivary juice. See THIRST.

Sometimes the *bile* from yellow becomes greenish, like verdigrise, and frequently pale, like the yolks of eggs, and that without any other apparent cause than a little motion, a convulsion, or a violent passion of the mind. This occasions many and terrible diseases, as nausea's, an abhorrence of food, anxiety, fighting, cardiacalga's, wind, diarrhoea's, dysenteries, acute diseases, fevers, and convulsions.

Sometimes it becomes black, and takes the name of *choler*: in this case it sometimes tastes like a very sharp vinegar; sometimes like putrified blood, gnawing, burning, dissolving, confusing, occasioning inflammations, gangrenes, mortifications, violent pains, and terrible fermentations.

Of *atrabilis*, or *black bile*, Boerhaave distinguishes three kinds: 1st, the mildest, arising from the matter of the blood, put in too great a motion, which hence takes the name of *adust*: the 2^d is an aggravation of the first arising from the same causes, only heightened: the 3^d is a corrupt, parched *bile*, which, if it arose from a greenish, or palish sort, is still worse.

Too great an evacuation of the *bile*, either upwards or downwards, robs the chylefaction of its main instrument; hence it prevents digestion, secretion, excretion of the feces, and produces an acid temperature, coldness, weakness, paleness, swoonings, &c.—If the *bile*, when prepared, be prevented its discharge into the intestines, it produces jaundice. See JAUNDICE.

Secretion of the BILE.—For the manner in which the *bile* is separated in the liver, there are various opinions.—Some maintain, that the pores of the secretory glandules of the liver have a certain configuration and magnitude, to which the particles of the *bile* floating in the blood being just answerable, both in bulk and figure, are admitted in, and all the rest excluded.—Others, with Sylvius and Lister, not allowing any difference in the configuration, as knowing that the pores of all the vessels are circular, and that particles of all kinds will be admitted, if small enough, have recourse to a ferment, which they suppose to reside in the liver, by means whereof the particles of the blood, in their passage through the secretory ducts, assume the form of *bile*. But, as this is little else than begging the question, others have recourse to another hypothesis; maintaining, that the fluids contained in the blood of the vena porta, while that enters the substance of the liver in its way to the extremities of the vena cava, indifferently apply to the apertures of the secretory tubes contiguous to the extreme branches of the porta, which are wide enough, and to the roots of the cava, which are not wide enough, to receive them; by which means being separated from the society and the intestine motion of the other and essential part of the blood, and being no longer agitated by the vital action of the blood-vessels, and becoming exposed to the actions of the *biliary* vessels, they constitute a new humour distinct from the blood, called *bile*, &c.—Dr. Keil chuses to account for the secretion of the *bile* from the strong attraction between the particles whereof it is composed. He observes, that the heart and liver being so near each other, were the cœliac artery to have carried all the blood to the liver, considering the velocity of the blood, so viscid a secretion as the *bile* could never have been affected. Nature therefore forms a vein for the purpose, viz. the porta, and by it sends the blood from the branches of the mesenteric and cœliac arteries to the liver; by which the blood is brought a great way about, passing through the intestines, stomach, spleen, and pancreas, ere it arrives at the liver; thus its velocity is exceedingly diminished, and the particles that are to form the *bile* have a sufficient time to attract one another, and unite before they come to their secreting vessels. But, as if this diminution of velocity were not sufficient for the purpose, nature has gone further; having made the cavities of all the arteries increase as they divide: thus the sum of the branches arising from the aorta, is to the aorta itself, as 102740 to 100000. And yet, as if that proportion were too little for the present purpose, nature has here taken a further step, and increased the branches springing from the mesenteric artery in a greater ratio. Thus, in a body which he examined, he found the sum of the branches more than double that of the trunk; and therefore the velocity of the blood in the former, must be less than half that of the latter. He further shews, from a just calculation, that the time the blood now takes in its passage from the aorta to the liver is at least twenty-six minutes: whereas, had an artery gone directly from the aorta to the liver, it would have passed in little more than half a second, viz. 2437 times in the space it now takes up in its passage. Whence, it appears, that the blood was not in a state fit to yield *bile*, had it gone directly from the aorta to the liver; and, that a longer time, and more languid motion, was necessary to have the *biliary* particles in a

readiness to be separated. He adds, that did the humours exist in the glands the same as they are found after secretion, nature would not on this occasion have been at so much expence to retard the blood's velocity: besides, that the *bile* has another advantage from the use of the porta; for, by running through so many parts ere it reach the liver, it leaves behind it most of its lymph; by which means the particles being brought nearer each other, are, by their mutual attraction, sooner united.

BILGE. See the article BIDGE.

BILINGUIS, in law, a denomination given the jury which passes in any case betwixt an Englishman and an Alien; whereof one moiety is to be natives, and the other, foreigners, if required.

BILIOUS complexion. See COMPLEXION, TEMPERAMENT, CHOLERIC, &c.

BILIOUS colic. See the article COLIC.

BILL, in husbandry, denotes an edge-tool, of the ax kind, fitted to a handle, and used to lop trees, &c.—When short, it is called an *hand-bill*; when long, an *edge-bill*.

BILL, in law, denotes a security for money under the hand and sometimes seal of the debtor, without any condition, or forfeiture, in case of non-performance.—In which it is distinguished from a bond or obligation.

BILL also denotes a declaration in writing, expressing a wrong, or grievance, which the complainant hath suffered by the party complained of; or else some offence committed by him against some law or statute of the realm.

This *bill* is commonly addressed to the lord chancellor; especially for unconscionable wrongs done sometimes to others having jurisdiction, according as the law they are grounded on, directs.—It contains the fact complained of, the damages sustained, and the petition of process against the defendant for redress.

BILL, in parliament, denotes a paper containing propositions offered to the houses, to be passed by them, and then to be presented to the king to pass into an act or law. See PARLIAMENT.

BILL of attainder. } See the article { ATTAINDER.

BILL of appeal. } See the article { APPEAL.

BILL of exchange, a short note, or writing, ordering the payment of a sum of money in one place, to some person assigned by the drawer, or remitter, in consideration of the like value paid to him in another place. See EXCHANGE and REMITTANCE.

The whole estate and effects of merchants often consist in *bills of exchange*.

A *bill of exchange* is an instrument so noble and excellent, that though it want those formalities required by the common law; as seal, delivery, and witnesses; and so cannot be deemed a specialty: yet is it superior to any bond or specialty by the respect that is paid it, and the punctuality and preciseness of the payment.

There is some dispute about the nature and sanction of a *bill of exchange*: some take it to be a contract of permutation, or exchange; but the more general opinion is, that it is a mere contract of buying and selling; that the money given the person who draws the *bill* is the price of sale; and that paid at the appointed place, the thing bought and sold.

Bills of exchange were unknown in the ancient Roman commerce, as well as jurisprudence. According to the common opinion, they are the invention of the Jews; who, being banished France, for some enormous crimes charged on them, retired into Lombardy, about the twelfth century, and found means to withdraw their effects, which they had lodged in the hands of friends, by secret letters and *bills* conceived in short precise terms, like the modern *bills of exchange*; and this, by the assistance of merchants and travellers.—The faction of the Gibellins, being expelled Italy by the Guelphs, retired to Amsterdam, and used the same means, for the recovery of their effects in Italy, as the Jews had done; hence the Dutch merchants took the hint of negotiating *bills of exchange*; and soon spread the practice throughout all Europe.—The same Gibellins are said to be the inventors of the *exchange*, on account of damages and interests, when *bills of exchange*, which they called *polizza di cambio*, are not paid, but returned on protest. See RE-EXCHANGE.

That which constitutes the form and essence of a *bill of exchange* is the cession, or transferring of a sum of money made by the drawer, to him, on whose account it is drawn, to be received of his correspondent in another place; which cession, or transfer, is made, in the mercantile terms, for *value received*, i. e. for a like sum given by the person for whose sake the *bill* is drawn, to the drawer, in money, merchandize, or other effects.

There are therefore three things necessary to constitute a *bill of exchange*; 1st, That it be drawn in one city on another; 2^{dly}, That there be three persons concerned, the drawer, the presenter, or the person for whom it is drawn, and the acceptor, or he on whom it is drawn. See ACCEPTOR. 3^{dly}, That it make mention, that the value which the drawer has received, is either in *bills of exchange*, in money, merchandize, or other effects, which are to be expressed; otherwise it is no *bill of exchange*.

When

When a *bill of exchange* is expressed to be for *value in itself*, it is not supposed the drawer has received the sum; but the person for whom it is drawn, stands debtor to him for it.—When a *bill of exchange* bears, for which sum I promise to furnish bills of exchange to such a place, the person for whom the bill is drawn may compel him to give the *bills*, or to return the money.

Bills of exchange may be divided into *inland* and *outland*.—*Outland* or *foreign bills* are those made for money taken up in some other country, and to be paid in England: or *vice versa*.—*Inland bills* are those made for money taken up in one part of the kingdom, and to be repaid in another.—By the stat. 9. & 10 Gul. 3. these latter are made equally binding with the former.

To note a *BILL*. See the article *NOTE*.

To protest a *BILL*. See the article *PROTEST*.

Bank-Bills are printed instruments, whereby private persons become entitled to a part in the bank-stock. See *BANK*.

BILL of parcels, an account of the particular sorts and prices of goods bought, given by the seller to the buyer.

BILL of lading, an instrument signed by the master of a ship, acknowledging the receipt of a merchant's goods, and obliging himself to deliver them, at the place to which they are consigned, in good condition.

Of such *bills* there are usually three: the *first* the merchant keeps; the *second* is sent to the factor to whom the goods are consigned; and the *third* is kept by the master of the ship.

BILL of sale is when a person wanting a sum of money, delivers goods as a security to the lender, to whom he gives this *bill*, empowering him to sell the said goods, in case the sum borrowed is not repaid, with interest, at the time appointed.

BILL of store, a kind of licence granted at the custom-house to merchants, to carry such stores and provisions as are necessary for their voyages, custom-free.

BILL of sufferance, a licence granted at the custom-house to a merchant, to suffer him to trade from one English port to another, without paying custom.

BILL of entry, an account of goods entered at the custom-house, both inward and outward; wherein is expressed, the merchant importing or exporting the quantity of goods, and the *ports*, and from whence imported, or to what place exported.

BILLS of mortality. See the article *MORTALITY*.

BILLA VERA, the *bill is true*.—The grand jury endorsing a *bill*, whereby any crime punishable in that court is presented to them, with the words *billa vera*, signify thereby, that the presenter has furnished his presentment with probable evidence, and worthy of further consideration; whereupon the party presented is said to stand indicted of the crime, and bound to make an answer thereto, either by confessing or traversing the indictment.

If the crime touch his life, it is yet referred to another inquest, called the *inquest of life and death*, by whom, if he be found guilty, he stands convicted of the crime, and is condemned by the judge.

BILLET, in heraldry, a bearing, in form of a long square. See *Tab. Herald. fig. 9*.

Billetts are said to be couched, or inverted, when their longest side is parallel to the top of the shield, and the shortest perpendicular.

They are supposed to represent pieces of cloth of gold or silver, longer than broad, placed at a distance by way of ornament, on clothes, and afterwards translated to their coat-armour;—though Guillemin takes the *billet* to represent a letter sealed up.

A coat is said to be *billetted*, when it is charged with *billetts*: Thus, he bears *argent-billettes*, a cross engrailed gules by the name of *Heath*.—Bloom says, the number of the *billetts* must be expressed when they are not above ten.

*BILLIARDS**, an ingenious kind of game played on an oblong table, covered with green cloth, and placed exactly level, with little ivory or wooden balls, which are driven by crooked sticks, made on purpose, into hazards, or holes, on the edge and corners, according to certain laws, or conditions of the game.

* The word comes from the French *billard*, of *bille*, the ball made use of; and that from the Latin *pila*, a ball.

*BILLON**, *BRILLO*, in coinage, a kind of base metal, either of gold or silver, in whose mixture copper predominates.

* The word is French, formed, according to Menage, from the Latin *bullus*, or *bullus*, bullion.—We do not find it is naturalized among us; but the necessity we are frequently under of using it in the course of this work, required its being explained.

According to M. Bouteroue, *billion* of gold is any gold beneath standard, or twenty-one carats; and *billion* of silver, all below ten penny-weights. But, according to others, and among the rest M. Boizard, gold and silver beneath the standard, as far as twelve carats, and six penny-weights, are properly base gold and silver, and all under those, *billion* of gold and *billion* of silver, in regard copper is the prevailing metal.

BIMEDIAL, in mathematics.—When two medial lines, as

AB and BC, commensurable only in power, and containing a rational rectangle, are compounded; the whole AC shall be irrational, and is called a *first binomial line*.

Eucl. 1. 10. prop. 38.

BINARY number, that composed of two units. See *NUMBER*. *BINARY arithmetic*, a method of computation, first proposed by M. Leibnitz; * wherein, in lieu of the ten figures in the common arithmetic, and the progression from 10 to 10, he has only two figures, and uses the simple progression from two to two.

* Jos. Pelican of Prague has more largely explained the principles and practice of the binary arithmetic, in a book entitled *Arithmetica per seclum qui tria numerare nescit*. 1712.

All his characters used in this arithmetic are 0 and 1: and the cypher, here, multiplies every thing by 2, as in the common arithmetic by 10.—Thus, 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten, &c. which is built on the same principles with the common arithmetic.

Hence immediately appears the reason of a celebrated property of the duplicate geometrical proportion in whole numbers, viz. that one number of each degree being had, we may thence compose all the other whole numbers above the double of the highest degree. It being here, v. gr. as if one should say, 111 is the sum of 4, 2, and 1, which property may serve essays to weigh all kinds of masses with a little weight; and may be used in coins, to give several values with small pieces.

100	4
10	2
1	1
111	7

This method of expressing numbers once established, all the operations will be easy: in multiplication particularly, there will be no need for a table, or getting any thing by heart.

The author however does not recommend this method for common use, because of the great number of figures required to express a number; adding, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious: but its use is in discovering the properties of numbers, in constructing tables, &c.

What makes the *binary arithmetic* the more remarkable is, that it appears to have been the same with that used 4000 years ago among the Chinese, and left in ænigma by Fohi, the founder of their empire, as well as of their sciences.

M. Lagni has proposed a new system of logarithms, on the foot of the *binary arithmetic*; which he finds shorter, more easy and natural, than the common ones.

BINARY measure, in music, is that which is beaten equally; or where the time of rising is equal to that of falling. See *TIME* and *MEASURE*.

BINDER's press. See the article *PRESS*.

BINDING books. See the article *BOOK-BINDING*.

BINOCULAR telescope, that to which both the eyes may be applied, and consequently the same object be observed at the same time by both.

It consists of two tubes, with two sets of glasses of the same power, and adjusted to the same axis; and has been pretended to represent objects much larger and clearer, than a single, or monocular glass.

BINOMIAL, or *BINOMIAL*, in algebra, a root consisting of two parts, or members, connected by the sign +, or —.

Thus $a + e$ and $5 - 3$ are *binomials*, consisting of the sums and difference of those quantities.

If a root have three parts, as $a + b + c$, it is called a *trinomial*; if more, a *multinomial*. See *TRINOMIAL*, *ROOT*, &c.

*BIOGRAPHER**, an author who writes the history, or life of one or more persons.—Such were Plutarch, Corn. Nepos, &c.

* The word is formed from the Greek βίος, life, and γραφω, scribo, I describe.

BIQUADRATE, or *BIQUADRATIC*, is the next power above the cube, or the square of a cube root. See *POWER*, *ROOT*, *QUADRATOQUADRATUM*, &c.

BIQUINTILE, an aspect of the planets, when they are 144 degrees distant from each other. See *ASPECT*.

BIRD, a two-footed animal, covered with feathers, and furnished with wings, whereby it can sustain itself in the air, and fly from place to place.

Birds are usually divided into *terrestrial* and *aquatic*.

Terrestrial birds are subdivided into those which have *crooked beaks* and *talons*; and those whose beaks and claws are *straiter*.

Of birds with *crooked beaks* and *talons*, some are carnivorous and rapacious, called *birds of prey*; others are frugivorous, called by the general name of *parrots*.

Of *birds of prey*, some prey in the day-time, and are called *diurnal*; others in the night, and are called *nocturnal birds*.

Diurnal birds of prey are either of a *greater* or a *lesser* size.—The *greater* are either of a more bold and generous nature, as the eagle-kind; or of a more cowardly and sluggish, as the vulture.

The *lesser diurnal birds* of prey are either of a generous and docile, or of a cowardly, sluggish, and untractable nature. The *generous and docile* are the hawk-kind, which are wont to be reclaimed and manned for fowling. These by the falconers are distinguished into *long-winged*, as the falcon, lanner, facre, gerfalcon, kestrel, &c. whose wings reach almost as far as the end of their train; and *short-winged*, as the goshawk and sparrow-hawk, whose wings, when closed, fall much short of the end of their trains.

The *cowardly and sluggish* are neglected by our falconers, and so live at large.—Of these also there is a *greater* sort, as the buzzard-kind; to which may be added the ringtail and kite; and a *lesser*, as the butcher-kind, or shrike, about the bigness of a blackbird.

Of *birds* of prey with crooked beaks and talons, others are *nocturnal*, as the owl-kind, which prey by night: and these are either horned or eared, as the eagle-owl, horn-owl, &c. or without horns or ears, as the brown owl, white owl, grey owl, howlet, fern-owl or goat-fucker, &c.

Frugivorous land-birds, with crooked beaks and talons, are distinguished into three sorts, according to their bigness; the *greatest* size being called maccaus, and cockatoons; the *middle-sized*, and most common, parrots, and popinjays; and the *least* sort, parakeets: these all make use of their beak in climbing, and move the upper jaw.

Land-birds which have their bills and claws more strait, are distinguished into three sizes; the *greatest* kind are, such as by reason of the bulk of their bodies, and smallness of their wings cannot fly at all; such are the ostrich, the cassowary; and the dodo.

The *middle-sized* are divided into such as have either *large and long*, or *smaller and shorter* bills.

Of those with large, thick, strong, and long bills, some feed promiscuously on flesh, insects, and fruits, as the crow-kind, which are wholly black; and the pye-kind, which are partly coloured, as the magpie, jay, &c. others feed on fish only, as the king's fisher; and others on insects only, as the wood-pecker.

For those which have a smaller and shorter bill; their flesh is either white, as the poultry kind; or blackish, as the pigeon, and thrush kind.

The *least sized* kind of *land birds*, with strait bills and claws, are called *small-birds*.—These are of two kinds; *soft-beaked*, which have slender, strait, and pretty longish bills, most of them, and feed chiefly upon insects; and *hard-beaked*, which have thick and hard bills, and feed mostly on seeds.

Among *birds* which have strait beaks and claws, Mr. Willughby observes, that the cassowary (as well as the pelican) is without a tongue; swallowing not only bits of iron, as the ostriches, but also red-hot coals; yet, not digesting the iron, but voiding it whole, as the ostrich also does.

Aquatic Birds, or *water-fowl*, are distinguished into such as *walk* in the waters, and such as *swim* in them.

Aquatics which *walk* are all cloven-footed, and generally have long legs, and those naked, or bare of feathers, a good way above the knee, that they may the more conveniently wade in waters.—Of these authors reckon two kinds; a *greater* and a *lesser*.—To the *greater* belongs the crane, jabiru, &c.—The *lesser* are either *piscivorous*, as the heron, spoon-bill, stork, &c. or *mudfuckers*, and *insectivorous*.

Of *insectivorous* water-fowl, some have *very long* bills; others *middle-sized* ones, as the sea-pye and red-throat; others *short bills*, as the lapwing and plover.

Of those with *long bills*, some have them crooked, as the curlew and whimbrel; and others strait, as the woodcock and godwit.

Note, those are reckoned *short bills*, which exceed not an inch and half; *middle sized* bills, to two inches and an half; and *long bills* above two inches and a half.

Of aquatics, which *swim* in the water, some are *fishpedes*, cloven-footed, as the moor-hen and coot, &c. but most are whole-footed, or web-footed, *palmipedes*.

Of these, some few have very long legs, as the flamant, the avocetta, and currua; but the generality are short-legged.

Of the *short-legged*, *whole-footed aquatics*, some have but three toes on each foot, as the penguin, razor-bill, &c. but generally they have four toes on each foot, and these either all connected together by intervening membranes, as in the pelican, soland-goose, &c. or more usually with the back-toe loose.

This last kind are either *narrow-billed*, or *broad-billed*.—Those with *narrow bills* have them either blunt or hooked at the tip, or sharp-pointed and straiter.

Of the former sort some are *ferrate*, as in the diver-kind; and some not toothed, as in the puffin.

Of those with sharp-pointed and straiter bills, some have long wings, as the gull-kind; and some shorter, as those diving birds called *douckers*.

Those with *broad bills* may be divided into the goose-kind, which are larger; and the duck-kind, which are smaller; and these latter into sea-ducks, or river and plash-ducks.

Most water-fowls have a short tail; and none of this kind

have their feet disposed like parrots and wood-peckers, which have two toes forward, and two backward, whereas none of these have more than one back-toe, and some have none at all.

BIRDS of Passage. See MIGRATION, PASSAGE, &c.

BIRDLIME, a viscid substance, prepared various ways, and from various materials, for the catching of birds, mice, and other vermin.

The *birdlime* ordinarily used among us, is made from holly-bark, boiled ten or twelve hours: when the green coat being separated from the other, it is covered up a fortnight in a moist place, then pounded into a tough paste, so that no fibres of the wood be left, and washed in a running stream till no motes appear, put up to ferment four or five days, skimmed as often as any thing arises, and laid up for use.—To use it, a third part of nut-oil, or any thin grease, is incorporated with it over the fire.

The *birdlime* brought from Damascus is supposed to be made of sebastes, their kernels being frequently found in it; but this does not endure either frost or wet.—That brought from Spain is of an ill smell; that of the Italians is made of the berries of millet heated, mixed with oil, as before; to make it bear the water, they add turpentine.—It is said, the bark of our viburnum or way-faring shrub, makes *birdlime* as good as the best. *Vid. Hought. Collect. N^o. 426, 427.*

BIRTH, the natural exclusion of a perfect fetus from the womb by the vagina. See FORTUS, DELIVERY, &c.

An *Immature BIRTH* is called an *abortion*. See ABORTION.

Præternatural births are those made by the way of the anus, navel, &c.

For the number of *births*, see MARRIAGE: under which the proportion of *births* to marriages, of *births* to burials, and of male-*births* to females are computed.

BIRTH, or *BIRTHING*, among seamen, denotes the due distance observed between ships lying at an anchor, or under fail.—A convenient place a-board for a mess to put their chests, &c. is also called a *birth*.—And a proper place to moor a ship in, is called by the same name.

After-BIRTH. See the article AFTER-BIRTH.

BISANT. See the article BESANT.

*BISHOP**, a prelate, or person consecrated for the spiritual government and direction of a diocese.

* The word comes from the Saxon *bishop*, and that from the Greek *ἐπίσκοπος*, an overseer, or inspector; which was a title the Athenians gave to those whom they sent into the provinces subject to them, to see whether every thing were kept in order; and the Romans gave the same title to those who were inspectors and visitors of the bread and provision. It appears from a letter of Cicero, that he himself had a bishopric, being *episcopus Oræ & Campaniæ*.

A *bishop* differs from an archbishop in this, that an archbishop with *bishops* consecrate a *bishop*, as a *bishop* with priests ordain a priest; that the archbishop visits a province, as the *bishop* a diocese; that the archbishop convokes a provincial synod, as the *bishop* a diocesan one; and that the archbishop has canonical authority over all the *bishops* of his province, as the *bishop* over the priests in his diocese.

It is a long time that *bishops* have been distinguished from mere priests or presbyters; but whether that distinction be of divine or human right, whether it was settled in the apostolical age, or introduced since, is much controverted! On the one side stands the New Testament, wherein it is certain the names *bishop* and priest are used indifferently: on the other side is tradition, the fathers, and the apostolical constitutions.

Indeed there appear no footsteps of any institution of *bishops*, distinct from priests, in the scriptures; neither do the opposers thereof pretend to shew any mark of any other form of church-government therein. So that it may seem probable, the apostles did not settle any thing of this kind at all; but either left the spiritual œconomy in the hands of the presbyters, or of those together with the people.

Accordingly, new occasions requiring new measures, in a little time, the functions of the priesthood were divided, and the priests distinguished into degrees; the political part of religion being assigned principally to *bishops*, and the evangelical to the priests, &c. Or rather, as some will have it, the functions of teaching and preaching were referred to the *bishops*, and that of ordination superadded; which was their principal distinction, and the mark of their sovereignty in their diocese.

The function of a *bishop*, in England, may be considered as twofold, viz. what belongs to his order, and what to his jurisdiction.—To the episcopal order belong the ceremonies of dedication, confirmation, and ordination: to the episcopal jurisdiction, by the statute-law, belongs the licensing of physicians, chirurgeons, and school-masters, the uniting small parishes, (though this last privilege is now peculiar to the *bishop* of Norwich) assisting the civil magistrate in the execution of statutes relating to ecclesiastical matters, and compelling the payment of tithes and subsidies due from the clergy.

By the common law, the *bishop* is to certify the judges, touching legitimate and illegitimate births and marriages; and by

that and the ecclesiastical law, he is to take care of the probate of wills, and granting administrations; to collate to benefices, grant institutions on the presentation of other patrons, command induction, order the collecting and preserving the profits of vacant benefices for the use of the successors, defend the liberties of the church, and visit his diocese once in three years. To the *bishop* also belong suspension, deprivation, deposition, degradation, and excommunication.

The *bishops* of England are all barons and peers. Barons in a two-fold manner, *viz.* feudal, in regard of lands and baronies annexed to their bishoprics; and by writ, as being summoned by writ to parliament.—They have the precedence of all other barons, and sit in the upper house, both as barons and as *bishops*.

Bishops have two special privileges next to regal: the first, that in their courts they sit and pass sentence, of themselves, and by their own authority: the *bishops* courts being not like other courts; but writs are sent out in their own name, *teste the bishop*, not in the king's name, as is done in the king's courts.—The second, That, like the king, they can depute their authority to another, as their suffragan, chancellor, commissary, &c.

They have also this advantage over lay-lords, that, in whatever Christian country they come, their episcopal degree and dignity is acknowledged; and they may, *quatenus bishops*, ordain, &c.

They have their vote in the trial and arraignment of a peer; but ere sentence of death, &c. they withdraw, and vote by proxy.—They have several immunities, as from arrests, outlaws, distresses, &c. liberty to hunt in the king's forests, &c. to have certain tuns of wine duty-free, &c. Their persons may not be seized, as lay-peers may, upon contempt, but their temporaries alone. They may qualify as many chaplains as a duke, *viz.* six.

By law, the crime of episcopicide, which a clergyman commits by killing his *bishop*, is equivalent to parricide, *viz.* it is petty-treason.

The form of consecrating a *bishop* is different in different churches.—In the Greek church, the *bishop* elect being by the assistant *bishops* presented for consecration, and the instrument of election put in his hand; after several prayers, (the first called diaconicon) the *bishop* elect demanding consecration, makes profession of his faith: after which he receives a benediction. He is then interrogated as to the belief of the Trinity; to which he answers by a long profession of faith, and receives a second benediction. Lastly, he is asked what he thinks of the incarnation; to which he answers in a third profession of faith; which is followed by a third benediction: after which the consecrator gives him the pastoral staff; then he is led up to the altar; where, after certain prayers, and three crosses on his head, he receives the pallium, if he be an archbishop, or patriarch; he then receives the kiss of peace, of his consecrator and two assistants; and, sitting down, reads, prays, and gives the communion to his consecrator and others.

In the Romish church, the *bishop* elect being presented by the elder assistant to the consecrator, takes the oath: he is then examined as to his faith; and, after several prayers, the New Testament is drawn open over his head, and he receives the chrism or unction on his head. The pastoral staff, rings, and gospel, are then given him; and, after communion, the mitre is put on his head: each ceremony being accompanied with proper prayers, &c. the process ends with Te Deum.

In England, the king being certified of the death of a *bishop* by the dean and chapter, and his leave requested to elect another, the conge d'elire is sent to them, nominating the person he would have chosen. The election is to be within twenty days after the receipt of the conge d'elire; and the chapter, in case of refusing the person named by the king, incurs a premunire.—After election, and its being accepted of by the *bishop*, the king grants a mandate under the great seal for confirmation; which the archbishop consigns to his vicar-general; confiding mostly in a solemn citation of such as have any objections to the *bishop* elect, a declaration of their contumacy in not appearing, and an administration of the oaths of supremacy and canonical obedience. Sentence being read by the vicar-general, the confirmation concludes with a treat.—Then follows the consecration, by the archbishop and two assistant *bishops*: the ceremony of which is much the same as in the Romish church, save that, having put on the episcopal robes, the archbishop and *bishops* lay their hands on the new prelate's head, and consecrate him with a certain form of words.—After communion they go to a banquet.

The process of the translation of a *bishop* to another bishopric only differs in this, that there is no consecration.

In Denmark there are six superintendants, who take it very kindly to be called *bishops*, and *my lords*.—They have no temporalities; keep no ecclesiastical courts; have no cathedrals; or prebends, &c. but are only *primi inter pares*, having the rank above the inferior clergy of the province, and the inspection into their doctrine and manners.

VOL. I.

The revenue of the superintendant *bishop* of Copenhagen is about 2000 rixdollars, yearly; and of the rest, 1500 rixdollars. They are allowed two or three parishes each. Their habit is common with that of the other ministers. *Account of Denmark*, p. 161.

In Sweden is an archbishop and ten *bishops*, with seven or eight superintendants under them.—The archbishopric of Upsal is worth but 400 l. per annum, and the rest in proportion.—They have also ecclesiastical courts, &c. *Rebins. Acc. of Swed.* c. 5.

REGIONARY BISHOPS. See the article REGIONARY.

BISHOP'S-COURT, an ecclesiastical court held in the cathedral of each diocese; the judge whereof is the *bishop's* chancellor, anciently called *ecclesiasticus*, and *ecclesie causidicus*, q. d. the church-lawyer; who judges by the civil and canon law; and, if the diocese be large, has his commissaries in remote parts, who hold what they call *consistory courts*, for matters limited to them by their commission.

BISHOPRIC, the jurisdiction of a *bishop*: or the district within which it is comprized; called also *diocese*.

There are 24 *bishoprics*, and two archbishoprics, in England and Wales.—To the old ones, subsisting before the times of the reformation; Henry VIII. by letters patent added five more *bishoprics*; *viz.* those of Chester, Gloucester, Peterborough, Bristol, and Oxford. *Stat. 34 & 35 H. 8. c. 17.*

BISKEIT, or **BISQUET**, usually denotes a delicate kind of bread, prepared by the confectioners, of fine flours, eggs, sugar, and rose or orange-water; or of flour, eggs, and sugar, with anniseeds and citron peel; baked again and again in the oven in tin or paper moulds.

* The word comes from the Latin *bis*, twice, and the French *cuit*, catus, q. d. twice baked.

We find divers sorts of such *biskets*; as, seed-*bisket*, fruit-*bisket*, long-*bisket*, round-*bisket*, naples-*bisket*, sponge-*bisket*, &c.

Sea-Bisket is a sort of bread much dried, by passing the oven twice, to make it keep for the service of the sea.—For long voyages they bake it four times, and prepare it six months before the embarkation. It will hold good a whole year.

BISMUTH, a mineral body, of the semi-metallic kind; by many supposed to be composed of the first matter of tin, while yet imperfect. It is found usually in tin-mines, sometimes also in silver-mines.

Its substance is hard, ponderous, and brittle, of a large grain, glossy, white, and shining.—It is also called *tin-glass*; because, when broke, it shews a vast number of little polished laminae like glass: it is also called *marcasite*, by way of excellence, because surpassing all other marcasites or semi-metals in whiteness and beauty.

Bismuth contains an arsenical salt, very dangerous to take inwardly. Its precipitate makes a very white magistery, which is mixed with waters and pomatums to make a fucus to beautify the complexion. There are also flowers prepared from it, which take away spots in the face. See the process in Quincy.

There is also an artificial *bismuth*, which is that ordinarily found in the shops, made by reducing tin into thin laminae, or plates, and cementing them by a mixture of white tartar, salt-petre, and arsenick, stratified in a crucible over a naked fire. The same is also by some made of a mineral called zink, using lead instead of tin, and a little calamine. See SUPPLEMENT, article BISMUTH.

BISQUET. See the article BISKET.

BISSECTION, in geometry, the division of any quantity into two equal parts, otherwise called *bipartition*. See DIVISION, &c.

BISSEXTILE, or *leap-year*, in chronology, a year consisting of 366 days, happening once each four years, by reason of the addition of a day in the month of February, to recover the six hours which the sun spends in his course each year, beyond the 365 days, ordinarily allowed for it. See YEAR.

The day thus added, is also called *bissextile*; Cæsar having appointed it to be the day before the 24th of February, which among the Romans was the sixth of the calends of March.

Thus the sixth of the calends of March was this year reckoned twice over; whence the intercalary day, and the year when it happens, were both called by the name *bissextile*.—By the statute *de anno bissextile*, 21 Hen. III. to prevent misunderstandings, the intercalary day, and that next before it, are to be accounted as one day.

The astronomers concerned in reforming the calendar, by order of pope Gregory III. observing, that the *bissextile* in four years added 40 minutes more than the sun spent in returning to the same point of the zodiac; and computing that these supernumerary minutes in 133 years would form a day; to prevent any changes being thus infensibly introduced in the seasons, it was appointed, that, in the course of 400 years, there should be three *bissextiles* retrenched: accordingly, in the year 1700, there was no *bissextile*, for that reason.

BISTER, or **BISTRE**, among painters and designers, a colour made of chimney-foot boiled, and afterwards diluted with water; serving to wash their designs. See WASHING.

Instead of this, some use the hatches of a pen, with a little Indian ink, others red chalk, others black lead, &c.

BISTOURY, a kind of surgeon's cutting instrument, of the knife-kind; much used in making incisions.—There are three kinds: the blade of the *first* turns backwards and forwards like a lancet for opening abscesses, and is sometimes used instead of it.—The *strait bistoury* does not turn, but stands straight in the handle like a common knife.—The *crooked bistoury* is shaped like a half-moon, the keen edge being on the inside. *Dionis ap. Bibl. Anat. t. 1. p. 427.*

BIT, or **BITT**, an essential part of a bridle; its form and use well known; its parts and kinds various.

The kinds of *bits* are, 1. The musroll, snaffle, or watering bit. 2. The cannon-mouth, jointed in the middle; preferred by Solleyfel to all others. 3. The cannon with a fast mouth all of a piece, only kneed in the middle, to form a liberty or space for the tongue; fit for horses too sensible or ticklish, and liable to be continually bearing on the hand. 4. The cannon-mouth, with the liberty in form of a pigeon's neck; proper where a horse has too large a tongue. 5. The cannon with a port mouth and an upset, or mounting liberty, used where a horse has a good mouth but large tongue. 6. The scatch-mouth with an upset; ruder, but more secure than a cannon-mouth. 7. The cannon-mouth with a liberty, after M. Pignatelli's manner; proper for a horse with a large tongue and round bars. 8. The mafficadour, or flavinger bit. 9. The cat's foot bit. 10. The bastonet bit, &c.

The several parts of a snaffle or curb-bit are—the mouth-piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the welts, the campanel or curb and hook, the bolies, the bolsters and rabbits, the water-chains, the side-bolts, bolts and rings, kirbles of the bit or curb, trench, top-roll, flap, and jeive.

BITE of a mad dog. See the article **HYDROPHOBIA**.

BITE of a viper. See the article **VIPER**.

BITE of a tarantula. See the article **TARANTULA**.

BITTER Almonds. } See the articles { **ALMOND**.
BITTER Waters. } { **WATER**.
BITTER Wine. } { **WINE**.

BITTERNESS, a kind of flavour or sensation, opposite to sweetness, supposed by some to result from this, that all the particles of the bitter body are broken, blunted, and diminished; so as none of them remain long and rigid: which is confirmed from this, that foods burnt, and their particles much comminuted and broken by the fire, become bitter.

BITUMEN, in a general sense, a fatty, tenacious, mineral juice, very inflammable; or a fossil body which readily takes fire, yields an oil, and is not soluble in water.

Naturalists distinguish three kinds of *bitumens*, *hard*, *soft*, and *liquid* or *oil*; each of which they subdivide into several species.

Among the *hard bitumens* are ranked, yellow amber, amber-graie, jet, asphaltum, pissaphaltum, pit-coal, and sulphurs.—The *soft* are, maltha, *bitumen* of Colao and of Surinam.—Lastly, the naphta of Italy, and petroleum, are ranked among the *liquid bitumens*.

Of *bitumens* some again are fossil, others are found floating on the surface of certain lakes, and others spring from the earth like fountains; as at Pitchford in Shropshire, &c.—Some *bitumens* are so hard, that they are used in forges, instead of coals: others so glutinous that they serve instead of cement, or mortar in buildings; of which kind that was which the famous walls of Babylon were built with: and others so liquid, that they are burnt in lamps instead of oil.

The *bitumen* in most esteem is that of Judea. See **SUPPLEMENT**, article **BITUMEN**.

BIVALVE, or **BIVALVULAR**, a term used by the writers of natural history, for such shell-fish as have two shells, *e. gr.* cockles, mussels, oysters, &c. which are said to be of the *bivalvular* kind.

A certain *bivalve* shell, being a large blood-red spondile in Bucco's cabinet, is said by Dr. Lister to have been purchased by the duke of Orleans for 900 livres, which is upwards of 50*l.* sterling. The same prince also offered a Parisian 10000 livres for 32 shells, and was refused.

BIVALVE is also applied to the filique, or seed-pods of such plants as open all their whole length to discharge their seeds—such are peas, beans, &c. which the botanists say, have *bivalve* or *bivalvular* filique.

BIVENTER, in anatomy, a denomination given to the sixth muscle of the lower jaw; being the last of those serving to depress or open it: thus called, as having two bellies for its two extremities, and a tendon in the middle.—See *Tab. Anat. (Myl.) fig. 2. n. 2.*

The *biventer* or *digestricus* has its origin from a fissure between the occipital bone and the mastoid apophysis, whence passing its tendon through a hole in the stylo-hyoides and an annular ligament of the os hyoides, there arise some fibres which join its second belly: hence, growing fleshy, and returning upwards, it is inserted into the middle of the in-

terior part of the lower jaw.—By this contrivance it is enabled to draw the jaw downwards.

BLACK, something opaque and porous, that imbibes all the light falling on it, reflects none, and therefore exhibits no colour.

There are various kinds of *blacks* which pass in commerce, *viz.* *dyers black*, *painters black*, *german black*, *ivory black*, *spanish black*, *lamp-black*, &c.

Dyers BLACK, is one of the five simple and mother colours used in dyeing; and is given differently, according to the different quality and value of the stuffs to be dyed. See **DYING**.

For broad-cloths, fine ratines, and druggets, &c. they use woad and indigo; the goodness of the colour consists in there not being above six pounds of indigo to a ball of woad, when the latter begins to cast its blue flower; and, in its not being heated for use above twice.—Thus blued, the stuff is boiled with alum, or tartar, then maddered; and, lastly, the *black* given with galls, coppers, and fumac.—To bind it, and prevent its smearing in use, the stuffs are to be well scoured in the fulling-mill, when white, and well washed afterwards.

For stuffs of less value, it is sufficient they be well blued with woad, and blacked with galls and coppers: but no stuff can be regularly dyed from white into *black*, without passing through the intermediate blue.

Yet there is a colour called *coal black*, or *jesuit's black*, prepared of the same ingredients as the former, but without being first dyed blue.—Here the drugs are dissolved in water that had boiled four hours, and stood to cool till the hand would bear it; then the stuff dipped in it, and again taken out six or eight times. Some even prefer this *black* to the other.—This method of dyeing *black* is said to have been invented by the Jesuits, and to be still practised in their houses, where they retain numbers of dyers.

By 23 *El. c. 9.* Nothing of the nature of cloth shall be maddered for a *black*, except it be first ground with woad only, or with woad and anele [blue ind.] unless the madder be put in with fumac or galls; on pain of forfeiting the value of the thing dyed. Provided it shall be lawful to dye any manner of *gall-black*, and *sumac-black* [plain black] wherein no madder shall be used.

Earth-BLACK is a kind of coal found in the ground, which, well-pounded, is used by painters in fresco.

There is also a kind of **BLACK** made of silver and lead, used to fill up the strokes and cavities of things engraved.

German or Frankfurt BLACK is made of the lees of wine burnt, then washed in water, and ground in mills for that purpose, together with ivory or peach-stones burnt.

This *black* makes the principal ingredients in the rolling-press-printers ink. See **INK**.—It is ordinarily brought from Frankfurt, Mentz, or Strasbourg, either in lumps or powder. That made in France is less valued than that of Germany, by reason of the difference between the lees of wine used in the one and the other; though some prefer that made at Paris to that of Frankfurt.

Ivory-BLACK is made of ivory burnt or charred, ordinarily between two crucibles well luted; which, being thus rendered perfectly *black*, and in scales, is ground in water, and made into troches, or little cakes, used by the painters; as also by the jewellers to blacken the bottom or ground of the collets, wherein they set diamonds to give them their tint or foil.

Lamp-BLACK, or **Lam-BLACK**, the sooty fumes of rosin, prepared by melting and purifying the rosin in iron vessels; then setting fire to it under a chimney, or other place made for the purpose lined a-top with sheep-skins, or thick linen-cloth, to receive the vapour or smoke, which is the *black*: in which manner they prepare vast quantities of it at Paris.

In England it is ordinarily prepared from the resinous and fatty parts of woods, burnt under a kind of tent, which receives it; but the greatest part is brought from Sweden and Norway.

It is used on various occasions, particularly in the printers ink; for which it is mixed with oils of turpentine and linseed, all boiled together. See **INK**.

It must be observed, that this *black* takes fire very readily, and when on fire, is very difficultly extinguished: the best method of putting it out is with wet linen, hay, or straw; for water alone will not do it.

Spanish BLACK, so called, because first invented by the Spaniards, and most of it brought from them, is no other than burnt cork used in various works, particularly among painters.

BLACK order.		ORDER.
BLACK star.		STAR.

BLACKMAIL, a certain rate of money, corn, cattle, or other matter, paid by the inhabitants of towns in Westmorland, Cumberland, Northumberland, and Durham, to divers persons inhabiting on or near the borders, being men of name, and allied with others in those parts, known to be great robbers and spoil-takers: in order to be by them freed and protected from any pillage.—Prohibited by 43 *El.* c. 13.

BLACKNESS, the quality of a black body; or a colour arising from such a texture and situation of the superficial parts of the body, as does, as it were deaden, or rather absorb, the light falling on it, without reflecting any, or very little, of it to the eye.

In which sense, *blackness* stands directly opposed to *whiteness*; which consists in such a texture of parts, as indifferently reflects all the rays thrown upon it, of what colour soever they be.

Sir Isaac Newton, in his *Optics*, shews, that for the production of black colours, the corpuscles must be less than those which exhibit any other colours: because, where the sizes of the component particles are greater, there is too much light reflected to constitute this colour: but, if there be a little less than is requisite to reflect the white, and very faint blue of the first order, they will reflect so little light, as to appear intensely black; and yet may, perhaps, reflect it variously to and fro within them so long, till it happen to be stifled and lost; by which means they will appear black in all positions of the eye, without any transparency.

And from hence it appears, why fire, and putrefaction, by dividing the particles of substances, turn them black?—Why small quantities of black substances impart their colours very freely, and intensely, to other substances to which they are applied; the minute particles of these, by reason of their very great number, easily overspreading the gross particles of others.—Hence also appears, why glass, ground very elaborately with sand, on a copper plate, till it be well polished, makes the sand, together with what by rubbing is worn off from the glass and copper, become very black;—and why black substances do, soonest of all others, become hot in the sun's light, and burn, (which effect may proceed partly from the multitude of refractions in a little room, and partly from the easy commotion of such very small particles);—also, why blacks are usually a little inclined towards a bluish colour: for, that they are so, may be seen by illuminating white paper with light reflecting from black substances, where the paper will usually appear of a bluish white; and, the reason is, that black borders on the obscure blue of the first order of colours; and therefore, reflects more rays of that colour than of any other.

BLACK ROD, *Gentleman-usher* of the **Black Rod**, is the chief gentleman-usher to the king; called in the black book, *Lator virgæ nigre, & hastiarius*, and elsewhere *virgi-bajulus*.

His duty is to bear the rod before the king at the feast of St. George at Windsor: he has also the keeping of the chapter-house door, when a chapter of the order of the garter is sitting; and, in time of parliament, attends the house of peers.—His badge is a *black rod*, with a lion in gold a-top. This rod has the authority of a mace.

BLACKS, *Negroes*; a nation of people, so called from the colour of their skin.—For the reason of their colour, and the commerce of them. See **NEGRO**.

BLACKS is also a name given to an association of disorderly, and ill-designing persons, herding chiefly about Waltham in Essex, who destroyed deer, robbed fish-ponds, ruined timber, &c.—Many of them were armed, and disguised, with their faces blacked.

Hence, we say, the *black act*, the *Waltham blacks*, &c.—Such doings for the future are made felony, by 9 *Geo.* c. 22.

BLADDER, in anatomy, a thin expanded membranous body, found in several parts of an animal, serving as a receptacle of some juice, or of some liquid excrement; from whence it takes various denominations, as *urine-bladder*, *gall-bladder*, &c.

BLADDER *, by way of eminence, is a large vessel, which serves as a receptacle of the urine of animals, after its secretion from the blood in the kidneys.

* This is sometimes also called, by way of distinction, the *urinary-bladder*, *vesica urinaria*.

The bladder is situated in the pelvis of the abdomen; in men, immediately on the rectum; in women, on the vagina uteri: Its figure in quadrupeds resembles a pear, with the basis upwards; but in human bodies the lower part is almost on a level with the upper; and, its orifice, or neck, placed sideways, while the fundus, or bottom, which, in a human bladder is very broad, rests either on the rectum, or the vagina uteri.—It is fastened to the navel by the urachus degenerated into a ligament, its sides to the umbilical arteries, and its neck to the intestine rectum in women.

The bladder is composed of three coats; the first a covering of the peritonæum, the second consists of muscular fibres, which run irregularly several ways; and the third, which is full of wrinkles for facilitating its dilatation, is both glandulous and nervous.—Its glands separate a viscid and slimy matter, which defends the bladder from the acrimony of the salts in the urine.

Around its neck there goes a small muscle, called *sphincter vesicæ*, which contracts the orifice of the bladder, to prevent the urine from dripping involuntarily, or till it thrust open the passage, by the contraction of the second coat of the bladder, which is therefore called *detrusor urinae*.

The diseases of the bladder are the stone, inflammations, ulcers, and palties; to which may be added, incontinence of urine, suppression of urine, &c. See **STONE**, **URINE**, &c.

Swimming, or *Air* **BLADDER**. See the article **SWIMMING**.

BLADE. See the article **SHOULDER-BLADE**.

BLAIND, a distemper incident to beasts, consisting in a bladder growing on the root of the tongue against the wind-pipe, which at length swelling, stops the breath.

It comes by great chafing, and heating of the stomach; whereby, as some judge, it still grows, and increases by more heat.

BLANCHE carte. See the article **CARTE**.

BLANCHING, the art or manner of *bleaching*, or whitening. See **BLEACHING**, and **WHITENING**.

BLANCHING of copper for sale, in imitation of silver; or mixing blanched copper with silver; or exposing the same to sale; or any malleable composition or mixture of metals or minerals heavier than silver, and which looks, and touches, and wears like gold, but is manifestly worse than standard is made felony, 8 & 9 *W.* 3. *&c.* 26.

BLANCHING of wax. See the article **WAX**.

BLANCHING, in coinage, the operation of preparing the pieces before striking, to give them the requisite lustre and brightness.

The *blanching*, as now practised, is performed by heating or heating the pieces in a kind of pan or shovel, with a wood-fire, in manner of a reverberatory furnace, so as the flame passes over the shovel. The pieces being sufficiently heated, and cooled again, are put successively to boil in two copper pans, wherein are aqua fortis, common salt, and tartar of Montpellier; when they have been well-drained of this first water in a copper sieve, they throw sand and fresh water over them; and when dry, they are well rubbed.

The ancient method of *blanching* was, by putting the pieces, after heating, in a large vessel of common water, and some ounces of aqua fortis; but in different proportions for gold and silver.—The method is now disused, partly by reason of its expensiveness, and partly because it diminishes the weight of the metal.

BLANCHE firme. See article **WHITE-MONEY**.

BLANCHED money. See the article **MONEY**.

BLANKS in coining. See **COINING**.

Point BLANK. See the article **POINT BLANK**.

BLANKET. See **HYKES**.

BLATTA * *Byzantia*, in physiology and pharmacy, a testaceous body, being the operculum, or lid of a turbinated shell, whose fish yields a purple dye.

* This is otherwise called *blatium byzantium*, *Blattus byzantinus*.

The *blatta* differs from the lid of the *buccinum*, or *purpura*, in figure; the first being oblong, the latter round: but in the shops they are ordinarily confounded, and sold for each other. The *blatta byzantia* is also confounded by apothecaries with the *unguis odoratus*, from which it ought to be distinguished as belonging to another kind of shell-fish.

Dr. Lister takes the *blatta byzantia* to have succeeded the *unguis odoratus*, and to have been brought into the shops in its place. In Dioscorides's time, the best was brought from the Red-Sea, viz. the palest and fattest; the blacker and less from Babylon, or the Persian gulph: but, it seems, latter times took up with those found about Constantinople; whence the present shop-blatta had its name.

The name *blatta* seems to have been given to this operculum from the colour; as being of a dark hair colour, as the common *blatta pislitaria*, or *bakehouse-beetle*, so frequent in London, is. See **SUPPLEMENT**, article **BLATTA BYZANTIA**.

BLAZE, in the manage. See the article **STAR**.

BLAZIN (*3-Star*). See the article **COMET**.

BLAZON *, or **BLAZONRY**, in heraldry, the art of deciphering the arms of noble houses; or of naming all the parts in their proper and particular terms.

* Various etymologies are given of the word *blazon*: the most probable is that which brings it from the German, *blasen*, to blow a horn; it being the custom of those who presented themselves at the lists in the ancient tournaments to blow a horn, to notify their coming. After this the heralds founded their trumpets, and then *blazoned* the arms of those who presented themselves; describing them aloud, and sometimes expatiating on the praises and high exploits of the persons who bore them.

There is this difference between *arms* and *blazon*; that the first are the device or figures bore on the coat, or shield; and *blazon*, the description thereof in words.

The rules of *blazon* are, 1^o. To name the metal or colour of the field first: as, *or*, *argent*, or *gules*, &c. 2^o. To name the manner of the division of the escutcheon by line, whether downright or bendwise, and also the difference of the

the line, whether it be indented, ingrailed, &c. in the next place. 3°. Then to name the charge that is on the field. 4°. Having thus exprest the field, the division, and the charge, if there be more parts of the field occupied by the charge than one, you are to name the principal part of the field first. 5°. If there be more than one kind of charge in a field, that in the chief part is to be named first. 6°. To use no iteration or repetition of words in *blazoning* a coat, especially of any of these four words, *of, or, and, with.* 7°. The three forms of *blazon* are by metals and colours, by precious stones, and by the celestial planets: the first for private gentlemen; the second for persons ennobled with titles, as dukes, earls, &c. and the third for emperors, kings and princes. Though this variety of form is rejected by the French, from whom we had our heraldry, and by all other nations, who use none but metals and colours for all degrees. 8°. That metal upon metal, and colour upon colour is false heraldry: which admits of no exception, except in the arms of Jerusalem, which are, argent, a cross potent between four crozets, or.—Add, that when lions stand upright in a coat, they are called *rampant*; when walking forward, *passant*; when they look you in the face, *passant guardant*; in other postures they have other terms, as *saliant, regardant, &c.* Wolves and bears are termed after the manner of lions; griffons (instead of *rampant* and *saliant*) are termed *segrant*; lions, griffins, and eagles, are also said to be *langued and armed*; swans, *embred*; hawks, *jested and belled*; cocks, *armed, crested, and jouleped*:—that is, when the tongues, bills, and claws of such creatures are found of different colours from the body.—When an animal proceeds from the bottom of the ordinary, it is termed *issuant*; when over some ordinary, *jeffant*; and if it proceed from the middle of any ordinary, or common charge, *naissant*.

BLEACHING, or BLANCHING, the art of whitening linens, stuffs, silks, and other matters.

BLEACHING of silk.—While it is yet raw, it is put into a thin linen bag, and thrown into a vessel of boiling river water, wherein soap has been dissolved, then boiled two or three hours, and the bag being turned several times, taken out, beaten and washed in cold water, slightly wrung out, and thrown into a vessel of cold water, mixed with soap and a little indigo: the indigo gives it the bluish cast always observed in white silks. After taking it out of the second vessel, it is wrung out, and all the water and soap expressed, shook out to untwist and separate the threads, and hung up in the air, in a kind of stove made on purpose, wherein is burnt sulphur; the vapour whereof gives the last degree of whiteness to the silk.

BLEACHING or scouring of woollen stuff.—There are three manners of whitening woollens; the first with water and soap; the second with vapour of sulphur; the third with chalk, indigo, and vapour of sulphur.

For the first, the stuffs being taken from the fulling-mill, are put into soaped water pretty hot, and worked a-fresh by force of arms over a bench, which finishes the whitening the fulling-mill had begun; and lastly, washed out in clear water and dried: this is called the *natural way of bleaching*.

In the second method, they begin with washing the stuff in river-water: it is then laid to dry on poles, and, when half dry, spread out in a kind of stove well-closed, wherein is burnt sulphur; the vapour whereof diffusing itself, sticks by little and little over all the stuff, and gives it a fine whiteness: this is commonly called *bleaching by the stove*.

In the third method, after the stuffs have been washed, they are thrown into cold water impregnated with chalk and indigo; after they have been well agitated here, they are washed a-fresh in clear water, half dried on poles, and spread in a stove to receive the vapour of the sulphur; which finishes the operation. This is not esteemed the best method of *bleaching*, though agreeable enough to the sight.

It may be here observed, that when a stuff has once received the steam of sulphur, it will scarce receive any beautiful dye, but black or blue.

BLEACHING of holland and fine linens.—After taking them from the loom, while yet raw, they are steeped a day in fair water, washed out and cleared of their filth, and thrown into a bucking-tub filled with a cold lixivium, or lie of wood-ashes and water. When taken out of the lie, they are washed in clear water, spread in a meadow, and watered from time to time, with water from little dikes, or canals, along the ground, by means of scoops, or hollow peels of wood, called by the Dutch, who pretend to be the inventors of them, *gieter*. After lying a certain time on the ground, they are passed through a new lie, poured on hot; and again washed in clear water, and laid a second time on the ground, and every thing repeated as before; then passed through a soft gentle lie, to dispose them to resume the softness which the other harsher lies have taken from them, washed in clear water, soaped with black soap, and that soap again washed out in clear water: they are then steeped in cow's milk, the cream first skimmed off, which finishes their whitening; and scouring gives them a softness, and makes them cast a little nap: when taken out of the milk, they are washed in clear water for the last time.—After all this process, they give the linen its

first blue, by passing it through a water wherein a little starch, smalt, and Dutch lapis lazuli have been steeped.—Lastly, the proper stiffness and lustre is given with starch, pale smalt, and gums, the quantity and quality whereof may be adjusted according to occasion.

In fine weather, the whole process of *bleaching* is completed in a month's time; in ill weather it takes up six weeks, or more.

BLEACHER. See the article **WHITSTER**.

BLEACHING of coarse linens. They are taken from the loom, and laid in wooden frames, full of cold water; where, by means of wooden hammers, worked by a water-mill, they are beat so, as insensibly to wash and purge them of their filth; then spread on the ground, where the dew, which they receive for eight days, takes off more of their impurity; then put into a kind of wooden tubs or pans, with a hot lie over them. Thus lixiviated, they are again purged in the mill, laid a-fresh on the ground, and after eight days more, passed through a second lie, and all things repeated, till such time as they have acquired their just degree of whiteness. Persons appointed by the trustees for improving the hempen and flaxen manufactures in Scotland, may enter into any bleach-yard, back-house, &c. and search all rooms, and the boilers therein, and view the lees, and refuse and dregs thereof—to see whether there have been any lime, pigeons-dung *, or soap-dregs used in the *bleaching* of linen cloth or yarn, contrary to the statute, 13 G. c. 26. §. 16.

* Lime, or pigeons-dung are not to be used in *bleaching* and whitening of linen, 10 A. c. 21.

For **BLEACHING of hair.** See the article **HAIR**.

For **BLEACHING of wax.** See the article **WAX**.

BLEEDING, phlebotomy, an operation in chirurgery; being the opening of a vein with a lancet, for the evacuation of corrupt or redundant blood.

Some physicians extol *bleeding* as the surest, and most efficacious species of evacuants. Yet was it very rare among the ancients, however frequent among the moderns.—Ostentius observes, that at Rome persons of quality are not allowed to be let blood, even in the most dangerous diseases, without leave from the pope.

The Hippopotamus is said to have first taught men the use of *bleeding*: for that animal being overcharged with blood, rubs herself against a pointed bulrush, and opens a vein; till finding its plenitude discharged, it welters in the mire to stanch the blood again. See **PHLEBOTOMY**.

BLEMISH, a term in hunting, used when the hounds, or beagles, finding where the chase has been, make a proffer to enter, but return.

BLEMMYES *, or **BLEMYES**, **BAEMTÉE**, among the ancient geographers, a fabulous sort of people, supposed without heads; having eyes and mouths in their breasts; said to have inhabited part of Æthiopia.

* Bochart derives the word *Blemmyes* from בלי, which implies a negation, and תבן brain: in which sense the *Blemmyes* should have been people without brains.

BLENDING of mortar. See **MORTAR**.

BLIGHT, a disease incident to plants, and affecting them variously; the whole plant sometimes perishing of it, and sometimes only the leaves and blossoms, which will be scorched and shriveled up, the rest remaining green and flourishing.

This disorder seldom happens but upon the blowing of sharp easterly winds, which are most frequent with us about March; whence that month proves, of all others, the most fatal to plants.—From this circumstance some imagine the colds that then reign, being exasperated by the eastern winds, effect *blights*; but Mr. Bradley furnishes a more plausible account: for, on this principle, it were hard to say why one plant, or one part of a plant, should be blighted more than another. He observes then, that caterpillars and other insects generally attend those winds, and that they infect some one kind of tree more than another, and even some particular branch more than others; and thence infers, either that the eggs of those insects, or the insects themselves, are brought to us by the eastern winds; or that the temperature of the air, when the eastern winds blow, is necessary to hatch those creatures, supposing the eggs to have been already laid on the infected parts. Now each of these causes seems to have its effect: those *blights* attended with large worms, or caterpillars, seem hatched by the eastern winds; and those others, which only produce the small insects, that occasion the curling of the leaves of trees, may proceed from swarms of them, either ready hatched, or in the egg, brought with the wind.

The coldness of those winds he shews to be no objection against their being fitted to hatch insects; different insects requiring vastly different degrees of heat. To this he adds, that every insect has its proper plant, or tribe of plants, which it naturally requires for its nourishment, and will feed on no other; and in which, therefore, it lays its eggs: it is no wonder then, that one kind of tree should be infected, and all the rest escape. That wind, *v. gr.* which brings, or hatches the caterpillars on the apple-tree, will not infect the pear, plum, or cherry; because, were the shoals of insects natural to the apple to light on those other trees mentioned,

they

they would either want their proper matrix to hatch in; or, were they ready hatched, would perish for want of proper food. So that it is morally impossible, all kinds of plants should be blighted at the same time, unless the eggs of every kind of insect natural to each tree could be brought at one time with the wind; or, that an easterly wind could contain in it, at once, as many different degrees of cold, or heat, as would be required to hatch and maintain each different class of insects. Nor is it any objection, that in *blights* there are not frequently any animals immediately perceivable. By the microscope, we discover animalcules a million of times less than the smallest which come under ordinary notice; these, the gentlest air may be conceived capable of blowing from place to place; so that it is no wonder if they be brought to us from the remotest regions, especially the north-east part of Great Tartary, &c. where the cold is intense enough to give them life; and from whence there is not fear enough, by the warmth and faintness of whose vapours they might be suffocated. Those brought from the north-east parts of America, are probably destroyed by passing the vast Atlantic ocean, which may be the reason why the north-west wind is not so infectious.

To prevent *blights*, the more knowing among country-people, while the easterly winds blow, used to guard against them by burning heaps of weeds, chaff, and other combustibles, on the wind-side of their orchards, that the smoke may either poison the insects or their eggs, as they pass along. It may be added, that these fires are often made with good success, to destroy the caterpillars, even after they are hatched, and have begun to devour the trees.—Another method of preserving trees from *blights* is, by sprinkling tobacco-dust, or pepper-dust; which, it is said, is present death to all insects, and animalcules.

Corn is liable to *blights* like other sorts of grain.

BLIGHT of Corn is called *Smut*. See the article *SMUT*.

BLIND Faith. See the article *FAITH*.

BLIND Gut. See *COECUM*.

BLINDNESS, a privation of the sense of sight, arising from a total deprivation of the organs thereof, or an involuntary obstruction of their functions.

The causes of *blindness* are various; proceeding from catarrhs, gutta serena's, &c.

We meet with divers instances of periodical *blindness*; some persons only finding the defect of their sight toward night; others only in the day.—

A Nocturnal *blindness* is called *Nyctalopia*.

A Diurnal one, *Hemeralopia*. See *NYCTALOPIA*.

The author of the embassy of D. Garcia de Silva Figueroa into Persia tells us, that in several parts of that kingdom are found vast numbers of blind people of all ages, sexes, and conditions; by reason of a species of little flies which prick the eyes and lips, and enter the nostrils, carrying certain *blindness* with them when they light on the eyes.

Aldrovandus speaks of a sculptor, who became *blind* at twenty years of age, and yet ten years after made a perfect marble statue of Cosmo II. de Medicis; and another of clay like Urban VIII. Bartholin tells us of a *blind* sculptor in Denmark, who distinguished perfectly well, by mere touch, not only all kinds of wood, but all the colours; and F. Grimaldi gives an instance of the like kind; beside the *blind* organist lately living in Paris, who is said to have done the same. F. Zahn recites abundance of instances of the amazing sagacity of blind people in his *oculus artificialis*.

Usually among chymists vessels are said to be *blind*, which have no opening but at one side.

BLINDS, or *BLINDS*, in fortification, a sort of defences, usually made of ozers, or branches interwoven and laid across, between two rows of stakes about the height of a man, and four or five foot apart; used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

BLISTER. See *VESICATORY*, and *EPISPASTIC*.

BLOCK is used for a piece of marble, as it comes out of the quarry, ere it has assumed any form from the workman's hand.

BLOCK, in falconry, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

BLOCKADE *, a sort of siege of a place, intended to be taken by famine; wherein all the passages, and avenues, are seized, and shut up, so as no supplies of provision can be brought in.

* It comes from the German *blockus*, or *blockhaus*, a bulwark, or house of wood; or from the Gaulish *blocal*, barricade: though others derive it from the Latin *buculare*, to stop a passage.

A *blockade* is no regular siege; inasmuch as there are no trenches or attacks. *Blockades* are formed by the cavalry.

The word *blockade* is sometimes also used in speaking of the beginning of a siege, when forces are sent to seize the principal avenues where the besiegers intend to fix their quarters. See *SIERGE*.

VOL. I.

BLOCKS, on board ships, are pieces of wood, in which the shivers of pulleys are placed, and wherein the running-ropes go. Of these, some are single, some double; and some have three, four, or five shivers in them. They are named and distinguished by the ropes they carry, and the uses they serve for.— See *Tab. Ship. fig. 2. n. 77*.

Block-Wood is a name sometimes given in our Laws to *Log-wood*. 23 Eliz. c. 9. See *LOG-WOOD*.

Wind-Tackle BLOCKS. See the article *WIND*.

BLOMARY, or *BLOOMARY*, the first forge in an iron-work, through which the metal passes after it is melted out of the ore. See *IRON*.

BLOOD, a warm, red liquor or humour, circulating, by means of arteries and veins, through every part of the body.

The *blood*, while in its vessels, appears to the naked eye uniform and homogeneous; but, when let out and cold, it separates spontaneously into two different parts: the one red and fibrous, which coheres into a mass, and is called the *cruur*; the other thin and transparent, which retains its fluidity when cold, and, being supposed specifically heavier than the other, sustains and bears it up, and is called the *serum*.—The proportion of the serum to the cruor, Dr. Drake makes at a medium, as one and a half to one; but Mr. Boyle, more accurately, makes the serum $\frac{1}{3}$ of the whole *blood*; and Dr. Jurin $\frac{1}{5}$ of the whole weight, or $\frac{1}{4}$ of the bulk.

By the microscope, the *blood* appears to consist of little red globules, swimming in an aqueous liquor, supposed to be the cruor and serum that appear distinct when let out. Mr. Leewenhoek computes these globules to be twenty-five thousand times smaller than the smallest grains of sand; and Dr. Jurin makes them still less. Upon an accurate mensuration, he found the diameter of one, equal to $\frac{1}{1000}$ of an inch, or less than $\frac{1}{100}$ of an ordinary hair of the head.

Dr. Drake thinks, that though the rapid motion of the *blood* may make the cruor appear round, and perhaps, by a kind of whirling or rotation, really convolute its parts; yet that their figure is not naturally globular, when let out, as appears from their cohesion, or hanging together in a lump; which spherical bodies, touching in a very few points, are not apt to do: but, on the contrary, this phenomenon, he thinks, argues an implication of their fibres within one another: which is confirmed by what Dr. Adams observed with his microscope, viz. that immediately after emission of *blood*, it is so far from exhibiting any red globules, that it appears to consist of infinite branches, running in no other order, and variously coloured.

Principles of the BLOOD.—By a chymical analysis, the *blood* is found to consist chiefly of phlegm, as the basis or vehicle; of volatile salts; of oil, which, by some nice examiners has been found of two kinds; and of caput mortuum or earth, which, though it may consist of divers substances, essentially different from each other, yet all we get out of it is a little fixed salt.—From the best experiments in this kind it appears, that in seven ounces of human *blood*, there are five ounces two drams of phlegm, three drams of a subtle spirituous oil, a small quantity of a thicker oil, two drams of salt, and about two of earth.

Dr. Jurin adds, that the serum, upon a chymical analysis, exhibits a great deal of phlegm, and of the other principles a small quantity; and, on the contrary, the cruor yields less phlegm, but the other principles much more copiously than the serum. From which data he concludes, that the globules consist of some phlegm united with the oil and salts, and a small quantity of earth; but, in what proportion, and how, and in what parts they are formed, &c. is not determined. Indeed, it must be considered, that the principles which the chymists thus produce separate, may possibly be much altered by the fire. Thus, it is past doubt, the oils drawn from the *blood* by fire are vastly different from the natural oil which circulates with the *blood*. To which may be added, that the caput mortuum remaining after distillation may, possibly, be a new production, which had no existence under any form resembling that in the *blood*.

The origin of the *BLOOD* is in the chyle, which passing the lacteals is delivered into the subclavian; where, mixing with the *blood*, they proceed together to the right ventricle of the heart; and there, being yet more intimately mixed, they circulate together through the whole body: till, after several circulations, and secretions at the several strainers of the body, they are assimilated, so as to make one uniform compound mass, which appears to be nothing else but chyle altered by the artifice of nature, and exalted into *blood*; there being no appearance of any thing extraneous mixed with the liquor circulating in the *blood-vessels*, but chyle; excepting what had been before separated from it, for some particular purposes, which being once served, it is returned to it again: unless, perhaps, it may receive some portion of air in the lungs.

That there is *Air mixed in the BLOOD*, and circulating with it, is past doubt; but, whether any more than was at first contained in the food whereof the chyle is formed, is a question not yet decided. The principal arguments urged for it, are,

K K K

the necessity of respiration; which may be accounted for on another principle: and the florid colour the blood receives in the lungs, and first shews in the vena pulmonalis; which is countenanced by an experiment made with the red grumous part of the blood after coagulation on blood-letting; for, upon turning the under-surface, which was before black, upwards, and exposing it to the air, by its contact therewith it acquires a florid colour, like that of the blood in the vena pulmonalis. But this effect others account for from the extraordinary agitation and comminution of the blood in the lungs.

Indeed, Dr. Keil, Bohnius, Bernoulli, and some other mathematic phylogists, go farther. Mr. Boyle having examined the specific gravity of blood, and found that of the serum to be greater than that of blood, in the proportion of 1190 to 1040, *i. e.* nearly as 8 to 7, it followed, that the cruor, or blood-globules, were specifically lighter than the serum, and that in a considerable degree; which was further confirmed by the globules being sustained in the serum, both while circulating, and when let out.—Hence it was conjectured, that these globules were nothing else but thin vesicles filled with a subtle aerial substance: and this opinion was confirmed from its being observed, in viewing the circulation by a microscope, that a blood-globule, in passing through a very narrow vessel, would change its shape from a globular, to an oval form, and would again recover its former figure, as soon as it was got through its narrow passage; which appearance was naturally enough ascribed to the elasticity of the included air: and, from this conjecture, were accounted for a great number of the phenomena of the animal oeconomy, particularly Dr. Keil's theory of muscular motion.

But this principle Dr. Jurin has examined, and appears to have overthrown. He made several experiments, in some of which the cruor before suspended a-top of the serum, by its adhesion to the sides of the porringer being cut off, and put in another vessel of serum, immediately sunk. In others, where the cruor buoyed up in the serum, even without any adhesion to the sides of the glass, and merely by the bubbles of air adhering to its surface, upon including it in a receiver, and exhausting the air, the bubbles bursting, the cruor would sink: whence he concludes, the globular part of the blood to be heavier than the serum: and, from other experiments, he ascertains the proportion of the gravity of blood to that of serum, to be as 1054 to 1030; whence the quantity of the globules being before fixed at $\frac{1}{4}$ of the whole, the precise gravity of the globules beyond that of the serum is easily determined.—The blood-globules therefore are not vesicles filled with air, or any other fluid substance lighter than serum: which is further confirmed from this, that blood-globules are not found to dilate, or undergo any alteration, in an exhausted receiver, when viewed through a microscope; whereas, were they filled with any elastic fluid, they would either burst, or at least dilate into 70 or 80 times the space.

As to the Heat of the BLOOD, authors are exceedingly divided about the cause thereof: the ancients ascribe it to a vital flame, or innate heat lodged in the heart, and thence communicated to the blood. Dr. Willis imagines a kind of accension in the blood; and thinks its heat results from its being, as it were, set on fire, and persevering in that state. Dr. Henshaw solves it from an ebullition consequent on the mixture of two fluids, so dissimilar as the chyle and blood. Others have recourse to the chymical principles of alcali and acid; others to the mutual action of the principles, or component parts of the blood, by means whereof an intestine motion, and by that means an intestine heat, or incalcescence, is effected.

Dr. Drake, with more reason, attributes the heat of the blood to the spring of the air inclosed together with it in the vessels: for, air being inclosed in the blood-vessels, will endeavour to expand itself, and, consequently, if it have force enough, will drive outwards the parts of the body that inclose it; by which means it causes the blood to beat against the sides of the vessels; which, having muscular, contractile coats, do in their turns compress it again, and so cause a reciprocal æstus in the blood, greater than the mere circulatory motion could; whence the parts of the solids, or containing vessels, being put into a constant agitation, a heat is produced in both, which they mutually impart to each other. See ATTRITION, &c. Lastly, Dr. Boerhaave accounts for the heat of the blood from the action of the heart, and the re-action of the aorta: for, the blood, driven by the heart obliquely against the sides of the aorta, presses them, and spends almost its whole momentum against the curvity thereof, and is, by the figure and elasticity of this vessel pressed back again. Every moment of time, therefore, each particle of blood acquires a new motion, a new nifus, and rotation: hence follows a perpetual attrition, attenuation, rubbing off of angles, and a similitude and homogeneity of all the parts; and hence the mass derives its fluidity, heat, division into particles accommodated to all vessels, pressure into the lateral tubes, &c.

Nor is the cause of the Redness of the BLOOD less obscure: the chymists account for it from the exaltation of its sulphur; others from the mixture of saline and subacid juices with sulphurous ones; and others from the colour of the

heart. The French philosophers attribute this redness to the smallness of the size, and roundness of the figure of the particles that compose the cruor; notwithstanding that red, being the colour of all others least refrangible, and the globular figure of all others the most refrangible, that figure seems, of all others, least apt to produce this colour. Others fetch the colour of the blood from the impregnation of the air in the lungs; for, that air is disposed to produce such an effect, appears from the experiment above.

But others, more reserved, extend this effect of the air no further than to account for the difference of redness between the venal and arterial blood; supposing, that after its colour has been heightened, and rendered more florid by the mixture of the air in the lungs, it retains it pretty well in the arteries; but, that circulating in the body, and carried through the veins, the air transpires, by degrees, through the pores of the vessels, and leaves the liquor of a paler dye.

Boerhaave accounts for the colour of the blood from the same cause as for its heat, *viz.* from the action of the heart, and re-action of the sides of the aorta. Borelli, to ascertain the cause of the redness, took a parcel of the cruor, after it had separated itself as far as spontaneously it would from the serum, and washing it frequently in water, found it separable into a viscous, slippery substance, consisting of white or colourless fibres (which rose to the surface of the water, and there gathered into a skim, or coherent pellicle of a reticular texture) and a deep-red powder, which precipitated pretty plentifully to the bottom. Hence, it appears, that the red colour of the blood is imparted to it by red tinging particles, as in the common case of dyes. By examining the red precipitate apart, and finding which of the elements it consisted chiefly of, a man who would reason about the colour of the blood from principles of the chymists, might carry that matter nearer an issue.

However, this red colour, though generally found in all terrestrial animals, is not yet absolutely necessary and essential; there being whole species which have their circulating liquor, or blood, white and limpid: to which Dr. Drake adds an instance of a pure white blood, like milk, which he let out of the median vein of a man, and which, when cold, did not separate into a crassamentum, as the red usually does; nor yield a skim or cream, or turn four upon keeping, as milk does. Dr. Beal gives us another instance of the like kind; and Dr. Lower adds a third, of a person who bled so long at the nose, till at last the broth he drank flowed, little altered, that way, as blood.

Changes and disorders of the BLOOD.—From the principles, or constituent parts of the blood above recited, variously combined and distributed by the circulatory motion impressed by the heart, and by the oscillatory expansive motion of the interspersed air, and the re-action of the contractile vessels, flow all the properties and operations of the blood. From this mixture of elements, and their lax composition, it becomes susceptible of various alterations and impressions; the principal whereof are, *coagulation*, which usually attends it out of the body, sometimes in it, and scarce ever without an artificial procurement, but always mortal: and *dissolution*, which is just opposite to the former, and consists in such a comminution of the fibrous parts of the blood, as indispenses it for a separation of the cruor from the serum. This is frequently the consequence of malignant and pestilential fevers, &c. and is likewise occasioned by some kinds of poisons.

These two contrary affections of the blood, Dr. Drake ascribes to the opposite kinds of salts, acids, and volatile alcalies. For though, adds he, in a human body, no sincere acid is found, nor could it, indeed, be consistent with life; yet, it may, and does often enter the blood, so compounded as to bridle the volatile, alcalious salt of the blood, and so hinder the due attenuation and mixture of the several parts; as is the case in a diabetes, and perhaps in a chlorosis, where the blood is thick and torpid: on the other hand, where the alcalious salts are too redundant, the blood is rendered too thin and fluid, so that the difference of its constituent parts is lost.

Another affection frequent in the blood is, a too great abundance of oils, or oily particles, by means whereof the active parts of the blood are too much clogged, and those parts which should be secreted, for peculiar uses in the body, are detained; and perhaps the solids, through which it passes, too much lubricated, their tone vitiated, shrunken, relaxed, &c. whence that sluggishness and inactivity of very fat people.

The contrary affection to this is, the defect of oil in the blood; which being, as it were, its balsam, lines and preserves the parts from being fretted and corroded by the salts, whose spicula or edges are, as it were, sheathed in this soft balsamic matter, and their attrition against the solid parts prevented: this state of the blood is usually attended with a general atrophy, and a fretting and corrosion of some particular parts; whence ferous defluxions, apothumations, and ulcers, especially in the lungs, whose tender vesiculous substance is

more

more easily annoyed than any other, by the acrimony of the saline serum. See CATARRH, CORPULENCY, &c.

There are other affections of the blood, resulting from its inordinate temperature and mixture, with regard to the earthy parts; the consequences of which are, the stone, &c. and others that do not originally spring from any dyscrasy, or undue mixture of the elements, but from an alteration in its motion; such as an augmentation or diminution of its progressive motion, or the like changes in its intestine motion; whence supernatural fermentations are induced.—The occasions here may be various; sometimes fevers, and other disorders occasioned by surfeits, debauches, catching cold, violent exercise, &c. whence atonias; at other times more latent malignity of the air, whence epidemical diseases.

The blood, thus variously compounded and circumstantiated, visits even the minutest parts of the body, by means of its circulatory motion: the cause and course whereof see under CIRCULATION.—In this round, those particles of the blood which conform best to the figure and structure of the parts through which they pass, are appointed to them, either for their accretion, or for the reparation of such as the constant rapid force of the blood wears off.

About the matter of nutrition, or the source whence the nourishment is derived, great contests have arisen among physicians and anatomists; some contending for a nutritious juice conveyed through the lungs; some setting up the lymph, others the chyle, some the serum of the blood, some the cruor, as the universal fucus alibilis, &c. However, all these, except they who bring the nutriment through the nerves, make the blood the vehicle, that conveys the alimentary parts through the body, whatever they be, and whencesoever derived: but, perhaps it was on the score of its heterogeneity, or composition of different elements, that they did not make it itself the nutritious fluid, without refraining that faculty to some particular parts thereof. But Dr. Drake makes no scruple to say, that the blood, in its largest acceptation, as consisting of all the parts before described, is simple and homogeneous enough for the purposes of nutrition; and that every part thereof contributes something, either materially or instrumentally, to the augmentation, or reparation, of the parts through which it passes.

For the manner in which the blood is formed, and how the chyle is assimilated into blood, see SANGUIFICATION.

The quantity of BLOOD in a human body, has been variously estimated by various authors: Dr. Lower computes it in an ordinary man, at about twenty pounds; Dr. Moulton by observing the proportion of the weight of several animals to their blood, estimates it at about $\frac{1}{10}$ of the weight of the whole man, which may amount to eight or ten pounds: Dr. Keil, from a calculation built on the proportion of the coats to the diameters of the vessels, shews, that in a body weighing 160 pounds, 100 pounds thereof are blood; but then under blood he includes the juices of the lymphæducts, nerves, and other vessels which are secreted from it.

Hence he also proposes a method of determining the velocity of the blood: for, as each ventricle of the heart is capable of receiving an ounce of blood; being full in their diastole, we may suppose they throw out about an ounce each systole. Now, the heart beats about 4000 times in an hour; therefore every hour 4000 ounces, or 250 pound of blood, passes through the heart. So that a quantity of blood equal to the whole mass, passes in two hours and a half: but, the sum of the sections of the branches of an artery being always greater than that of the trunk, the velocity of the blood will constantly decrease as the artery divides; and the ratio of its greatest to its least velocity in the arteries may be thus found to be as 5223 to 1. Again, the veins are to the arteries, as 441 to 324; wherefore, as the blood returns to the heart by the veins, its velocity will be still further diminished, and may be found to move more slowly in the veins than in the aorta, 7116 times. Again, the farther the blood goes off the heart, the more slowly it returns. The times of these are directly as the spaces, and reciprocally as the velocities; consequently, some parts may be some thousands of times longer in returning to the heart than others.—From the diameter of the aorta, and the quantity of blood driven out every pulse, the velocity of the blood in the aorta is easily determined, and found to be at the rate of 52 feet in a minute.

But Dr. Jurin shews, that in any two arteries transmitting equal quantities of blood, the momentum of the blood is greater in the artery more remote from the heart than in that nearer; and that its momentum is greater in all the capillary arteries together, than in the aorta; and, lastly, that the momentum of the blood is greater in any of the veins, than in the artery corresponding to it; and therefore greater in the vena cava, than the aorta.

Lastly, he shews, that the momentum of the blood in the vena cava is equal to that of the quantity of blood thrown out into the aorta at each systole, whose velocity is such as would pass the whole length of the arteries and veins in the interval of time between two pulses; and that the absolute momentum of the blood in the cava, without any regard to the resistance, is equal to the momentum of the weight of

thirty pounds passing over the space of an inch in a second.—But note, that the motion of the blood is here supposed equal, which in reality it is not.

For the depuration of the blood, and how the animal juices are secreted from it, see ANIMAL SECRETION.

As to the transfusion of the blood of one animal into the veins of another, first set on foot by Dr. Lower, see the method and effects thereof under TRANSFUSION.

In the Philosophical Transactions we have several very uncommon instances of spontaneous hæmorrhages or effusions of blood; particularly of a child that bled at the nose, ears, and hind-part of the head, for three days; from that to the sixth, she sweat blood from the head; on the sixth, bled at the head, shoulders, and waist; and for three days more continued to bleed at the toes, bend of the arms, joints of the fingers of each hand, and at the fingers ends till she died: After her death were found, in the places whence the blood issued, little holes like the prickings of a needle.

For the flanching of blood, see STYPTIC.

Dragons BLOOD.

See the article { DRAGON. SALAMANDER.

BLOOD of Christ is the denomination of a military order instituted at Mantua in 1608, by Vinc. Gonzagua IV. its device was, *Domine prebisti me*; or, *Nilil hoc triste recepto*.

Hermant speaks of this order, and observes it took its name from some drops of the blood of Christ, said to have been preserved in the cathedral church of Mantua.

The number of knights was restrained to twenty, besides the grand master; the office whereof was annexed to himself and his successors.

There is also a congregation of nuns at Paris called by the same name, reformed from the Bernardines.

BLOOD-HOUND. See the article HOUND.

BLOOD-LETTING. See BLEEDING, and PHLEBOTOMY.

BLOOD-SHOTTEN, a distemper of the eyes, wherein the blood-vessels are greatly distended, so as to make the eyes appear red. See OPHTHALMIA.

BLOOD-STONE. See HÆMATITES, and SANGUINE.

BLOODY Hand, one of the four kinds of trespases in the king's forest, by which the offender being taken with his hands or other part bloody, is judged to have killed the deer, though he be not found either hunting or chasing.

BLOODY heel-cock. See HEELER.

BLOODY rains. See the article RAIN.

BLOODY flux. See FLUX, and DYSENTERY.

BLOODY urine, a disorder wherein the urine comes away mixed with blood, in greater or less quantity. See URINE.

The blood here voided, usually comes from the kidneys, though sometimes from the bladder or ureters.—It is sometimes occasioned by violent motion, or a fall on the back, causing a rupture of some of the blood-vessels of the urinary parts; sometimes it succeeds sudden suppressions of the hæmorrhoids or menses. The stone, especially in the kidneys, will also occasion frequent paroxysms of this disease: and cantharides taken internally, or even applied externally without acids, will sometimes have the same effect.—Bloody urine is a terrible symptom in the small-pox and malignant fevers; though on some occasions it has proved critical, and carried off the distemper.

BLOOM. See the article { HALF bloom.

BLOOMARY. See the article { BLOMARY.

BLOWING of glass, one of the methods of forming the divers kinds of works in the glass manufacture.—It is performed by dipping the end of an iron pontgelo or blowing-pipe, in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown.

BLUE, one of the primitive colours of the rays of light.

Anciently, blue was the symbol of the sea; for which reason, in the Circenian games the combatants who represented the sea were clad in blue; and those who had distinguished themselves by any notable exploit at sea, were rewarded with a blue ensign.

The painters BLUE is made differently according to the different kinds of paintings. In limning, fresco, and miniature, they use indifferently ultramarine, blue ashes, and smalt; these are the natural blues, excepting the last, which is partly natural, partly artificial: see each under its proper head.

In oil and miniature they use indigo, blue vice, blue verditer, lapis armenus, smalt, and litmoule; also a counterfeit ultramarine.

Enamellers and painters on glass have blues peculiar to themselves; each preparing them after their own manner. See ENAMELLING, and painting on GLASS.

Dyers BLUE is one of their simple or mother-colours, used in the composition of others: it is given chiefly with woad, and indigo. Some dyers heighten their blue, by adding madder, brail, and other woods. The way of brightening blues is by passing the stuff, when dyed and well washed, through lukewarm water; or, which is much better, by working and fuling the dyed stuff with melted soap, and then scowering it well.

well.—*Blues* are dyed immediately from the whites, without any other preparation than scowering. See **DYING**.
Turnsol BLUE is a blue used in painting on wood, made of the seed of that plant. It is prepared by boiling four ounces of turnsol in a pint and a half of water wherein lime has been slacked. See **TURN SOL**.

Flanders BLUE is a colour seldom used but in landships, as being apt to turn green. The French call it *cendre verte*, or green ashes.

BLUE-coat hospital. } See the article { **HOSPITAL**.
BLUE Vitriol. } { **VITRIOL**.

BLUEING of metals is done by heating of them till they assume a blue colour; particularly practised by gilders, &c. who blue their metals ere they apply the gold or silver leaf. See **GILDING**.

BLUENESS, that quality which denominates a body blue; or, such a size and texture of the parts that compose the surface of a body, as disposes them to reflect the blue or azure rays of light, and those only, to the eye.

For the *blueness* of the skies, Sir Isaac Newton observes, that all the vapours, when they begin to condense and coalesce into natural particles, become first of such a bigness as to reflect the azure rays, ere they can constitute clouds of any other colour. This, therefore, being the first colour they begin to reflect, must be that of the finest and most transparent skies, in which the vapours are not arrived to a grossness sufficient to reflect other colours.

M. de la Hire, after Leonardo da Vinci, observes, that any black body viewed through a thin white one, gives the sensation of blue; and this he assigns as the reason of the *blueness* of the sky, the immense depth whereof being wholly devoid of light, is viewed through the air illuminated and whitened by the sun. For the same reason he adds, it is, that foot mixed with white makes a blue; for white bodies being always a little transparent, and mixing themselves with a black behind, give the perception of blue. From the same principle he accounts for the *blueness* of the veins on the surface of the skin, though the blood they are filled with be a deep red; for red, he observes, unless viewed in a clear, strong light, appears a dark brown, bordering on black: being then in a kind of obscurity in the veins, it must have the effect of a black; and this, viewed through the membrane of the vein and the white skin, will produce the perception of *blueness*.

BLUSHING, a suffusion, or redness of the cheeks, excited by a sense of shame, on account of a consciousness of some failing, or imperfection.

Blushing is supposed to be produced from a kind of consent, or sympathy, between several parts of the body, occasioned by the same nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongue, and nose; hence a thing seen, or heard, that is shameful, affects the cheeks with *blushes*, driving the blood into the minute vessels thereof; at the same time that it affects the eye, and ear. For the same reason it is, as Mr. Derham observes, that a favourable thing seen or smelt affects the glands and parts of the mouth: if a thing heard be pleasing, it affects the muscles of the face with laughter; if melancholy, it exerts it self on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr. Willis ascribes the pleasure of kissing.

BOARD, a piece of timber sawed thin, for the purposes of building. See **TIMBER**.

We say a *deal-board*, an *oak-board*, &c.—Boards thicker than ordinary are called *planks*.—Boards formed ready for the coopers use are called *clap-boards*. We have also *mill-board*, and *scale-board* shaved very thin for cases, band-boxes, &c.—*Peck-board*. See **PAST-BOARD**.

<i>Feather-edged BOARD.</i>	} See the articles	FEATHER.
<i>Graining-BOARD.</i>		GRAINING.
<i>Lag-BOARD.</i>		LOG.
<i>Sound-BOARD.</i>		SOUND.
<i>Trail-BOARD.</i>		TRAIL.
<i>Waste-BOARDS.</i>		WASTE.
<i>Weather-BOARD.</i>		WEATHER.

BOARDED floors. See the article **FLOOR**.

BOAT, a small, open, floating vessel, commonly wrought or moved only by rowing; intended chiefly for the navigation of rivers, lakes, and the like.

The boat acquires various names, according to its various structure, and the various uses it is appointed for, and the places where it is to be used.—The several boats, and their names are,

A jolly boat.	} Boats for ships	A ballon of Siam,
A long boat.		A horse boat.
A fluffe.		A periaga.
A pinnace.		A pleasure boat,
A water boat.		A ponton.
A yawl.		A canoe.
A gondola.		A cruce.
A greenland boat.		A currycerry.
A bermudas boat.		A deal hooker.

A filucca.	A tilt boat.
A ferry-boat.	A tod boat.
A prau.	A well boat.
A flying prau.	A wherry.
A punt.	

The boats, or wherries allowed to ply about London are either *skullers*, wrought by a single person with two oars; or oars, wrought by two persons, with each an oar.—All boats rowed with more than four oars above or below London bridge are forfeited. 8 Geo. c. 18.

De Chales propothes the construction of a boat, which, what burden soever it bear, shall not only move against the current, without either sails or oars, but also advance so much the faster, as the rapidity of the water is greater. Its make is the same with that of the others, excepting only a roller added to its side, with a cord, which winds round a roller as fast as the wheel turns.

Something of the like kind has also been since done by M. Pitot. *Vid. Mem. Acad. R. Scienc. an. 1729. p. 359. and p. 540.*

A new attempt, and with greater success, is also said to have been lately made at Vienna.

M. de la Hire has given us an examination of the force necessary to move boats, both in stagnant and running water, either with ropes fastened to them, or with oars, or with any other machine: wherein he shews, that the larger the surface of the oars plunged in the water, and the smaller that of the boat presented to the water is; and again, the longer that part of the oar between the hand and the place where the oar rests on the boat, and the shorter that between this last point and the water; the freer will the boat move, and the greater effect will the oar have. See **OAR**.

Hence it is easy to calculate the force of any machine that shall be applied to rowing; *v. gr.* if we know the absolute force of all the men who row, it must be changed into a relative force, according to the proportion of the two parts of the oar; *i. e.* if the part out of the vessel be double the other, and all the men together can act with the force of 900 pounds, we compute first, that they will exert 300: which 300, multiplied by the surface the vessel presents to the water, gives a solid of water of a certain weight; which weight may be found, and of consequence the velocity impressed on the vessel by the oars. Or, the velocity of the oars may be found in the same manner, by multiplying the 300 pounds by the surface of all the parts of the oars plunged in the water. Nor would there be any difficulty in finding first the relative forces, then the absolute ones; the velocities either of the oars, or of the vessel being given, or the proportion of the two parts of the oar.

BOAT-SWAIN, an officer on board a ship, who has charge of her rigging, ropes, cables, anchors, sails, flags, colours and pendants; and is also to take care of the long-boat, and its furniture, and to steer her, either by himself or his mate.

He calls out the several gangs aboard, to the due execution of their watches, works, &c.—He is likewise a kind of provost-marshal, who fees and punishes all offenders sentenced by the captain, or a court-martial of the fleet. See **PROVOST**.

BOBBING. See **FISHING**.

BOCARDIO, in logic, the fifth mode of the third figure of syllogisms, wherein the first proposition is particular and negative, the second universal and affirmative; and the third or conclusion particular and negative. Thus,

BOC Some animal is not man,

AR Every animal has a principle of sensation.

DO Therefore something has a principle of sensation that is not man.

BOCK-LAND formerly denoted that which we now call *free-hold land*, or *charter land*; and it was by that name distinguished from *folk-land* which was *copyhold land*. See **FREEHOLD**.

BODY*, in physics, a solid, extended, palpable substance; of it self merely passive, and indifferent either to motion or rest, but capable of any sort of motion, and of all figures and forms.

* The word alludes to the Saxon *bodige*, stature; and to the Belgic *bode*, a cover, *q. d.* the tabernacle of the soul.

Body is composed, according to the Peripatetics, of matter, form, and privation; according to the Epicureans and Corporularians, of an assemblage of hooked, heavy atoms; according to the Cartesians, of a certain quantity of extension; according to the Newtonians, of a system, or association of solid, massy, hard, impenetrable, moveable particles, ranged or disposed in this or that manner; whence result bodies of this or that form; distinguished by this or that name.

These elementary or component particles of bodies must be infinitely hard; vastly harder than the bodies compounded of them; nay, so hard as never to wear, or break in pieces. "This Sir Isaac Newton observes is necessary, in order to "the world's persisting in the same state, and bodies continuing of the same nature and texture in several ages."

Affections

Affections of BODY. See the article *AFFECTION*.

Modes of BODY. See the article *MODE*.

Elements of BODY. See the article *ELEMENT*.

The existence of BODIES is a thing incapable of being demonstrated: the order in which we arrive at the knowledge of their existence, seems to be this.—We first find we have sensations; we then observe we have not those sensations when we please; and thence conclude, we are not the absolute cause thereof, but that there is required some other cause for their production. Thus we begin to know, that we do not exist alone, but that there are several other things in the world together with us.—But this, Dr. Clark owns, comes far short of a demonstration of the existence of a corporeal world: he adds, that all the proof we have of it is this; that God would not create us such, as that all the judgments we make about things existing without us, must necessarily be false. If there be no external bodies, it follows, that it is God who represents the appearance of *bodies* to us; and that he does it in such a manner as to deceive us.—Some think this has the force of a demonstration: "It is evident God cannot deceive us; it is evident he does deceive and delude us every moment, if there be no *bodies*; it is evident therefore, there must be *bodies*."—But the minor of this argument may be denied without any suspicion of scepticism.

"In effect, were it possible for *bodies*, i. e. solid, figured, &c. substances to exist without the mind, corresponding to those ideas we have of external objects, yet how were it possible for us to know it? Either we must know it by sense, or reason: as for our senses, by them we have only the knowledge of our sensations or ideas: they do not inform us that things exist without the mind, or unperceived, like those which are perceived. It remains, therefore, that if we have any knowledge at all of external things, it must be by reason inferring their existence from what is immediately perceived by sense. But how shall reason induce us to believe the existence of *bodies* without the mind, when the patrons of matter themselves deny that there is any necessary connection betwixt them and our ideas. In effect, it is granted on all hands, and what happens in dreams, phrenzies, deliriums, extasies, &c. puts it beyond dispute, that we might be affected with all the ideas we have now, though there were no *bodies* existing without, resembling them. Hence, it is evident, the supposition of external *bodies* is not necessary for the production of our ideas." *Berkeley's Princ. of Human Knowledge*, p. 59.—"Granting the materialists their external *bodies*, they by their own confession, are never the nearer knowing how our ideas are produced; since they own themselves unable to comprehend in what manner body can act upon spirit; or how it is possible it should imprint any idea on the mind. Hence, the production of ideas or sensations, in our minds, can be no reason why we should suppose *bodies*, or corporeal substances; since that is equally inexplicable with or without the supposition. In short, though there were external *bodies*, it is impossible we should ever come to know it; and if there were none, we should have the same cause to think there were, that we now have." *Id. ibid.* p. 60, 61.

"Try whether you can conceive it possible for a sound, or figure, or motion, or colour, to exist without the mind, or unperceived.—If you can but conceive it possible for one extended, moveable substance, or, in general, for any one idea to exist otherwise than in a mind perceiving it; I shall readily give up the cause." *Id. ibid.* p. 63.—"It is worth while to reflect a little on the motives which induced men to suppose the existence of material substance; that so, having observed the gradual ceasing and expiration of those motives, we may withdraw the assent grounded to them. First, therefore it was thought that colour, figure, motion, and the rest of the sensible qualities, did really exist without the mind; and for this reason, it seemed necessary to suppose some unthinking substratum, or substance, wherein they did exist, since they could not be conceived to subsist by themselves. Afterwards, in process of time, men being convinced that colours, sounds, and the rest of the sensible secondary qualities had no existence without the mind; they stripped this substratum of these qualities, leaving only the primary ones, figure, motion, &c. which they still conceived to exist without the mind, and consequently to stand in need of a material support. But having shewn above, that noise, even of these, can possibly exist otherwise than in a spirit, or mind, which perceives them, it follows, that we have no longer any reason to suppose the being of matter." *Id. ibid.* p. 118, 119.

For the Colours of BODIES: Sir Isaac Newton shews, that *bodies* appear of this or that colour, as they are disposed to reflect most copiously the rays of light originally endued with such colours. But the particular constitutions, whereby they reflect some rays more copiously than others, remain yet to be discovered. However some of the laws and circumstances thereof, he delivers in the following propositions.

1. Those surfaces of transparent *bodies* reflect the greatest quantity of light, which have the greatest refracting power;

i. e. which intercede mediums, that differ most in their refractive densities: and in the confines of equally refracting mediums, there is no reflection. 2. The least parts of almost all natural *bodies* are in some measure transparent; and the opacity of those *bodies* arises from the multitude of reflexions caused in their internal parts. 3. Between the parts of opaque and coloured *bodies* are many spaces, either empty, or replete with mediums of different densities; as water between the tinging corpuscles wherewith a liquor is impregnated, air between the aqueous globules that constitute clouds or mists: and even spaces void both of air and water, between the parts of hard *bodies*, are not wholly void of all substance. 4. The parts of the *bodies*, and their interstices, must be less than of some definite bigness, to render them opaque and coloured. 5. The transparent parts of *bodies*, according to their several sizes, reflect rays of one colour, and transmit those of another, for the same reason that thin plates or bubbles do reflect, or transmit those rays: and this appears to be the ground of all their colour. 6. The parts of *bodies*, on which their colours depend, are denser than the medium which pervades their interstices. 7. The bigness of the component parts of natural *bodies* may be conjectured from their colours; on this principle, that transparent corpuscles, of the same thickness and density with a plate, do exhibit the same colour. 8. The cause of reflexion is not the impinging of light on the solid or impervious parts of *bodies*, as commonly believed. 9. *Bodies* reflect and refract light, by one and the same power variously exercised, in various circumstances.

BODIES, are divided into *animate* and *inanimate*; i. e. into those informed by a soul, and those which are not; or those that have life, and those that have none.

Some consider *bodies*, either as *natural* and *sensible*; viz. as formed by physical causes, and clothed with physical qualities: (in which sense, *body* makes the object of physics, See *PHYSICS*.) Or, as *intellectual* or *quantitative*, in the general or abstract; and according to three dimensions: in which sense, *body* makes the subject of geometry.

Alkaline BODIES.	} See the article	ALKALINE.
Consistent BODIES.		CONSISTENT.
Elastic BODIES.		ELASTIC.
Fixt BODIES.		FIXT.
Heterogeneous BODIES.		HETEROGENEOUS.
Atmosphere of BODIES.		ATMOSPHERE.
Descent of BODIES.		DESCENT.
Mercury of BODIES.		MERCURY.

BODY, with regard to animals, is used in opposition to *soul*; viz. for that part of an animal, composed of bones, muscles, canals, juices, nerves, &c.

In which sense, *body* makes the subject of comparative anatomy.

The human *BODY*, considered with regard to the various voluntary motions it is capable of performing, is an assemblage of an infinite number of levers, drawn by cords; if considered with regard to the motions of the fluids it contains, it is another assemblage of an infinity of tubes and hydraulic machines. Lastly, if considered with regard to the generation of those same fluids, it is another infinite assemblage of chymical instruments and vessels; as, philters, alembics, recipients, serpentes, &c. and the whole is a compound which we can only admire, and whereof the greatest part escapes our admiration itself.—The principal chymical apparatus in the whole *body*, is that wonderful laboratory the brain: it is in this, that precious extract, called animal spirits, the only material mover of the whole fabric, is secreted from the blood.

In the machine of the animal *body*, the retainers to the doctrine of trituration maintain the brain to do the office of the beam of a press; the heart, of a piston; the lungs, of bellows; the mouth, of a millstone; and the teeth, of pestles; the stomach, of a press; the intestines, of a reservoir; the vessels, of sieves or strainers; and the air, of a pondus, or spring that sets the machine a going.

The soul, Rohault observes, is not the form of the human *body*, as the Peripatetics assert. So far is animal life from depending on the soul, because of its ceasing when the soul is separated; that, on the contrary, the continuance of the soul depends entirely on the state of the *body*: the former never quitting the latter, till its economy or order is interrupted.

The Cartesians maintain the soul and *body* to be too disproportionate, for thoughts or ideas of the soul to be caused by the motions of the *body*, and *vice versa*: thus, their reciprocal motions not being able to be the direct cause of the one and the other, are only deemed the occasion, or occasional cause. God on occasion of the motion of a *body*, impresses an idea or sensation on the soul; and again, on occasion of an idea of the soul, communicates a motion to the *body*: of consequence, God is the only agent in the whole intercourse between soul and *body*.

Physicians divide the *body* into solids, and fluids.—Also into venters, or cavities, the head, thorax, and lower venter.

The rest of the *body* they call members or extremities.

Faculties of the Body. See the article *FACULTY*.

Body, corpus, is also applied by anatomists to several particular parts of the animal fabric.—As, the callous *body* of the brain, the cavernous or spongy *bodies* of the penis, &c. See *CORPUS CALLOSUM*, *CORPORA CAVERNOSEA*, &c.

Reticular Body. See the article *RETICULAR*.

Body in Geometry denotes the same with *solid*. See *SOLID*.

The *Regular or Platonic Bodies* are those which have all their sides, angles, and planes similar and equal.

Of these there are only five, *viz.* the tetrahedron, consisting of four angles; the octahedron, of eight; the icosaedron, of twenty; the dodecahedron, of twelve pentagons; and the cube of six squares.

Body in Law—A man is said to be bound or held in *body and goods*; that is, he is liable to remain in prison, in default of payment.

In France, by an ordonnance of 1667, all restraints of the *body*, for civil debts, are null after four months, unless the sums exceed two hundred livres.

A woman, though in other respects she cannot engage her person but to her husband, may be *taken by the body*, when she carries on a separate trade.

Body, corps, in war, is an aggregate or assemblage of forces, horse and foot, united and marching under some chief.

An army, ranged in form of battle, is divided into three *bodies*; the van-guard, the rear-guard, and the main *body*; which last is ordinarily the general's post.

Body of Reserve. See the article *RESERVE*.

*BOG**, a moist, rotten spot of earth, which sinks, and gives way to the weight of the body, formed of grass and plants putrified by some spring; frequent, especially in Ireland.

* The word may be derived from the Italian *bucca*, a hole; or rather from the Belgic *boegen*, to bend, on account of its giving way when trod upon.

In this sense, *bog* amounts to much the same with what in other places are called *masses*, *marishes*, *fens*, &c.

Ireland is become infamous for *bogs*; they distinguish between a *turf-bog*, called also *red-bog*, out of which turf or peat is dug; and a *quaking-bog*, which will sink under a man in the place where he stands to a considerable depth, and rise before and behind proportionably; underneath, is frequently clear water, into which a person often slips to the middle, upon breaking the surface.—*Quaking-bogs* frequently turn into *turf-bogs*.

Every *red bog* is incompassed with a deep marshy sloughy ground, called the *bounds of the bog*.—Horns and skeletons of moule-deer are sometimes found in *bogs* fourteen foot deep.

The inconveniences of *bogs* are, that a considerable part of the kingdom is rendered useless by them: they also keep people at a distance from each other, and thus hinder business from going forward. They occasion the roads to be crooked and circuitous to avoid them: they are a great destruction to cattle, the chief commodity of Ireland; which are encouraged by the grass growing on the edges of the *bogs* to venture in, where they are lost: they are also a shelter to robbers and thieves. The smell and vapour arising from them is accounted unwholesome, and the fogs putrid and stinking. Add, that they corrupt the water, both as to its colour and taste.

Bogs have also their uses: most of the people in Ireland have their firing from them; the wood being impolitically destroyed, and little pit-coal yet discovered. The Irish could hardly do without some *bogs*.—The natives had anciently another advantage from *bogs*; *viz.* that by means of them they were preserved from the conquest of the English: and it seems to be from the remembrance hereof that they still chuse to build near *legis*.

For the origin and formation of *Bogs*, it is to be observed, that there are few places, in the northern world, but have formerly been as famous for them, as Ireland now is: every wild, ill-inhabited country has them: the *loca palustris*, or *paludes*, to which the ancient Gauls, Germans, and Britons, retired when beaten, appear to be no other, than what we now call *bogs*. The like may even still be found in the barren parts of Italy, as Liguria.

The true cause of *bogs*, then, seems to be the want of industry; at least it is certain industry may remove, and much more prevent them. There are many *bogs* of late-standing in Ireland, formed within our own memory, through the miseries of the times, and the desolations of civil war.—It is no wonder if a country famous for laziness should abound with them.

To shew how want of industry causes *bogs*, it must be remembered that Ireland abounds with springs; that these springs are dry, or nearly so, in the summer-time, and that the grass and weeds grow thick about the places where they burst out. In the winter the same springs swell again, and run and soften and loosen the earth about them; and the sword or scurf of the earth, which consists of the roots of

grass, being lifted up and made fuzzy by the water, becomes dried again the spring; and does not fall together, but withers in a tuft, and new grass springs through it; which, the next winter is again lifted up: thus the spring is more and more sloop; and the scurf grows thicker and thicker, till it first makes what we call a *quaking bog*: and as it grows higher and dryer, and the grass roots and other vegetables become more putrid, together with the mud and slime of the water, it acquires a blackness, and grows into what we call a *turf-bog*.

What confirms this account is, that *bogs* are generally found higher than the land about them, and the highest in the middle: the chief springs which cause them being commonly about the middle; from whence they dilate themselves by degrees, as one would blow a bladder; but not always equally, because they sometimes meet with greater obstacles on one side, than on the other.—Add, that if a deep trench be cut through a *bog*, you will find the original spring, and vast quantities of water will run from it, and the *bog* will subside; sometimes a dozen or 15, some even say, 30 foot.—Lastly, those hills which have no springs, have no *bogs*; and those which have springs, and want culture, are never without them. In brief, wherever *bogs* are, there are great springs: the turf generally discovers a vegetable substance; it is light, and impervious to water, while the ground under it is very pervious.

True, there are some *quaking bogs* caused otherwise; as, when a stream or spring runs through a flat; if the passage be not tended, it fills with weeds in summer, trees fall a-crois it, and dam it up; then in winter, the water stagnates farther and farther every year, till the whole flat be covered; next, there rises a coarse kind of grass peculiar to these *bogs*; it grows in tufts, and the roots consolidate together, and yearly grow higher, in so much as sometimes to reach the height of a man: this grass rots in winter, and falls on the tufts, and the feed with it, which springs up next year, and thus makes a new addition: sometimes the tops of flags and grass being interwoven on the surface of the water, and become by degrees thicker, till they lie like a cover on the water; other herbs take root in it, and by a plexus of those roots it becomes strong enough to bear the weight of a man.

Another cause of *bogs* is moss, with which Ireland abounds extremely.—That which grows in *bogs* is remarkable; the light spongy turf above-mentioned being nothing but a congeries of the threads of this moss, which is sometimes in such quantities, and so tough, that the turf-spades cannot cut it: in the north of Ireland they call it old wives tow; not being much unlike flax. The turf-holes in time grow up with it again, and all the little gutters in *bogs* are generally filled with it. In reality, to this the *red* or *turf-bogs* seem to be chiefly owing.

For the draining of *Bogs*, to render them fit for pasture or arable, it is not impossible; the same having been performed in England, France, Germany, &c.—People commonly distinguish between *bogs* which have no fall to carry away the water from them, and those which have; the last are reputed drainable, the former not. But Mr. King assures, he never observed one *bog* without a fall sufficient to drain it, nor does he believe there is any. In reality, the great objection against draining is the charge; which, it is commonly reckoned, will amount to much more than would purchase an equal quantity of good ground: for an acre of this last in most parts of Ireland is not worth above 4 s. *per annum*, and 14 or 15 years purchase; so that three pound will buy an acre of good land; and it is very doubtful with most, whether that sum will reduce a *bog*: this reasoning passes current, and is the great impediment of this work.

To this it is answered, that *quaking-bogs*, though land be never so cheap, never fail to be worth draining; one trench will drain many acres; and when dry, it is generally meadow, or the best grazing ground. Again, what is called the bounds of a *red bog*, never fail to be worth the draining; being done by one deep trench drawn round the *bog*; by this cattle are kept out of the *bog*, and the bounds turned into meadow.—Add, that even *red bogs* might be made fit for grazing at a much cheaper rate than has hitherto been done, by a proper conduct in the digging of trenches, particularly described by Mr. King.—See *Philos. Transact.* N^o. 170. p. 948. *seq.* & N^o. 330. p. 305. Item N^o. 314. p. 59. *Plot. Nat. Hist. Oxford.* c. 9. §. 81. *seq.* Mortim. *Husband.* T. 1. l. 1. c. 2. p. 21.

*BOGOMILI**, or *BOGARMITÆ*, a sect of heretics, sprung from the Manichees, or rather from the Massilians toward the close of the 11th century; whose chief, Basil, was burnt alive by order of the emperor Alexander Comnenus.

* Du Cange derives the name from two words in the Bulgarian language, *bog*, *daus*, and *milos*, *miserere*, have mercy.

The *Bogomili* denied the trinity; maintaining, that God had a human form, that the world was created by evil angels; and that it was the archangel Gabriel that became incarnate. They rejected the books of Moses, and only admitted seven books of scripture: they maintained the lord's prayer to be the only eucharist; that the baptism of the Catholics was only that of St. John, and theirs that of Jesus Christ; and that all those of their sect conceived the word, or logos, as much

much as the virgin. Lastly, that there was no other reformation but repentance.

BOILING, or *Boiling*, *Ebullition*, in physics, the agitation of a fluid body, arising from the application of fire, &c.

The phenomenon of *boiling* may be thus accounted for: the minute particles of the fuel being detached from each other, and impelled in orbem, with a great velocity, (*i. e.* being converted into fire) pass the pores of the containing vessel, and mix with the liquid. By the resistance they here meet withal, their motion is destroyed; *i. e.* they communicate it wholly to the quiescent water; hence arises, at first, a small intestine motion in the water, and from the continued action of the first cause, the effect is increased, and the motion of the water continually accelerated: so that the water, by degrees, becomes sensibly agitated. But now the particles of the fire striking on those in the lowest surface of the water, will not only give them an impulse upwards, contrary to the laws of equilibrium, but will likewise render them specifically lighter than before, so as to determine them to ascend according to the laws of equilibrium: and this, either by inflating them into little vesicles, by the attraction of the particles of water around them; or by breaking and separating the little spherules of water, and so increasing the ratio of their surface to their solid content. There will therefore be a constant flux of water from the bottom of the vessel to the top; and consequently a reciprocal flux from the top to the bottom: *i. e.* the upper and under water will change places; and hence we have the reason of that phenomenon, of the water's being hot at top sooner than at bottom.

Again, an intense heat will diminish the specific gravity of water, so as not only to make it mount in water, but also in air; whence arise the phenomena of vapour and smoke: Though the air inclosed in the interstices of the water must be allowed a good share in this appearance: for that air being dilated, and its spring strengthened by the action of the fire, breaks its prison, and ascends through the water into the air; carrying with it some of the contiguous spherules of water, so many as shall hang in its villi, or can adhere immediately to it.

The particles of air in the several interstices of the fluid mass thus expanded, and moving upwards, will meet and coalesce in their passage; by which means great quantities of the water will be heaved up, and let fall again alternately; as the air rises up, and again passes from the water: for the air, after coalition, though it may buoy up a great heap of water, by its elasticity while in the water, yet cannot carry it up together with itself into the atmosphere; since, when once got free from the upper surface of the water in the vessel, it will unbind itself in the atmosphere, and so its spring and force will become just equal to that of the common unheated air. Add to this, that were the spring and motion of the air sufficient to carry up the water with it, yet it would not have that effect; but the water would run off at the extremities of the air; all, except so much as should be either entangled in its villi, or immediately adhere to its surface by attraction: and hence we see the reason of the principal phenomenon of *boiling*, *viz.* the fluctuating of the surface of the water.

Water, only lukewarm, *boils* very vehemently in the recipient of an air-pump, when the air is exhausted: the reason is obvious; for the pressure of the atmosphere being taken off from its surface, the air inclosed in the interstices of the water, dilated by a feeble heat, has spring enough to heave up the water, and disengage itself.—When the water ceases *boiling*, it is again excited thereto by pouring cold water upon the recipient; and when it *boils* the most vehemently, it ceases by pouring on hot water: the reason whereof is scarce guessed at. See **VACUUM**.

BOILING Waters, in natural history. See **WATER**.

BOLE, in medicine, is applied to several kinds of earths that enter some of the Galenical compositions. See **SUPPLEMENT**, article **BOLE**.

BOLE Armeniac*, or the *Armenian BOLE*, is a soft, friable, fatty earth, usually of a pale red colour; tho' there are two other kinds, a yellow and a white. They are all easily pulverized, and adhere to the tongue. The common or red kind is esteemed a good drier, styptic, and vulnerary; and in those qualities is used in divers diseases both internally and externally.

* This, popularly, though corruptly, called in English, *bole Armeniac*, is called, by the naturalists, *Armenia terra*, sometimes *terra Armeniaca*, or *Armenian clay*.

This *bole* is easily falsified; and the druggists frequently sell some other earth in lieu thereof. Matthiolus says, it is found in gold, silver, and copper-mines.

BOLE of the Levant is a medicinal earth brought from the Levant; nearly of the same nature, and having the same uses with the *bole-armeniaca*.

Pomet says, there is no such thing among us, as either true *bole-armeniaca*, or *bole of the Levant*; and that all the *boles* now in use are brought either from the provinces of France,

or the neighbouring countries: but this does not seem sufficiently warranted; and the new tariffs, or duties on goods imported into France, which mention them both, make it credible that there are of each kind imported into that kingdom. Indeed, it appears, that it is the *Levant bole* which usually passes among us for the *Armeniac*. See **SUPPLEMENT**, article **BOLE ARMENIA**.

BOLLANDISTS, in literary history, a denomination given to certain Jesuits of Antwerp, who have been a considerable time employed in collecting the lives and acts of the saints.—Thus called from F. Bollandus, one of the first and chief of the association.

As we find frequent occasion to quote that learned body in this work, and are indebted to them for several excellent observations that occur herein, the reader will not be displeased to find some account of them.

In the beginning of the 17th century, F. Heribert Rosweide, a Jesuit of Antwerp, laid a design of collecting the lives of the saints, as wrote by the original authors, with notes, like those added to his lives of the fathers, to clear obscure passages, and distinguish the genuine from the spurious: but he died in 1629, ere the work was begun.—The year following, J. Bollandus, a Jesuit of the same house, took up the design; and whereas Rosweide only proposed to collect the lives already composed, Bollandus undertook, where there was no life of a saint extant, to compose new ones from the authors who had mentioned him.—In 1635, he took in G. Henschenius, as a partner with him; and in 1641, published the *acts of the saints of the month of January*, in two large volumes, folio. In 1650, F. Papebroch became an associate; and, Henschenius dying, the fathers, Baert, Janning, Sollier, and Raye were called in, who continued the work: whereof, in eight years, there have appeared twenty-four volumes, for the first six months of the Roman calendar.

BOLONIAN. See **BOONIAN**.

BOLT, in building, an iron fastening, fixed to doors and windows.

Boles are chiefly of three kinds, *plate*, *round*, and *spring-boles*.

BOLT of a Lock. See the article **LOCK**.

BOLTS, or iron pins in a ship, are of several sorts, frequently distinguished according to the places where they are used; as, *chain-bolts*, *bolts for carriages*, &c. *ring-bolts*, serving for the bringing to of the planks, &c. *drive-bolts*, used to drive out others; *set-bolts*, employed for forcing the planks and other works, and bringing them close to one another; *rag-bolts*, on each side full of jags or barbs, to keep from flying out of their holes; *clench-bolts*, those which are clenched or fastened at the ends where they come through; *fore-lock-bolts*, made like locks with an eye at each end, whereinto a fore-lock of iron is driven to prevent starting out; *feud*, or *fender-bolts*, made with long and thick heads, struck into the uttermost bends or wales of a ship, to save her sides from bruises and hurts.

Thunder-BOLT. See the article **THUNDER-BOLT**.

BOLT-HEAD, the same as *matraji*; a vessel used by the chymists. See **MATRASS**.

BOLTING*, a method of pleading, or arguing, in use in the inns of courts; inferior to mooting. The case is argued first by three students, then by two barristers; a senior sitting judge.

* The word comes from the Saxon *bolts*, an house, because done privately within doors for instruction.

BOLUS, in medicine, an extemporaneous form of remedy, of a soft consistence, somewhat more so than that of an electuary, and of the quantity of one dose, or morfel to be swallowed down; contrived principally for the sake of such as have an aversion to potable medicines; as also for the better conveyance of certain preparations of mercury, antimony, &c. which by their weight would sink to the bottom of the glass, were they given in draughts.

There are *boles* of various kinds, made with electuaries, confectons, conserves, pulps, powders, salts, oils, essences, extracts, syrups, &c. some of which ingredients must always have solidity or dryness enough, to give a consistence to those that are liquid.

BOMB*, a hollow iron ball, or shell, filled with gunpowder, and furnished with a vent for a fusee, or wooden tube filled with combustible matter; to be thrown out from a mortar.

* The word *bomb* comes from the Latin *bombus*, *crepitus*, or *strilus avi*, by reason of the noise it makes.

The method of preparing a *bomb* is as follows: a hollow iron globe AB, (*Tab. Fortification. fig. 8.*) is cast pretty thick, having a round aperture A, by which it may be filled and lighted; and circular anse CD, for the commodious putting it into the mortar.

To prove whether it be staunch, after heating it red-hot on the coals, it is exposed to the air, so as it may cool gently; for since fire dilates iron, if there be any hidden chinks or perforations, they will thus be opened and enlarged; and the rather, because of the spring of the included air continually acting from within. This done, the cavity of the globe is filled with hot water,

water, and the aperture well stopped; and the outer surface washed with cold water and soap; so that if there be the smallest leak, the air, rarified by the heat, will now perspire and form bubbles on the surface.

If no defect be thus found in the globe, its cavity is filled with whole gunpowder; a little space, or liberty is left, that when a fusée or wooden tube a c , of the figure of a truncated cone, is driven through the aperture, and fastened with a cement made of quick-lime, ashes, brick-duft, and steel-filings, worked together in a glutinous water; or, if four parts of pitch, two of colophony, one of turpentine, and one of wax; the powder may not be bruised. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gun-powder-duft, well-rammed.

This fusée, set on fire, burns slowly till it reach the gun-powder, which goes off at once, bursting the shell to pieces with incredible violence: whence the use of *bombs* in besieging towns.

Special care, however, must be taken, that the fusée be so proportioned, as that the gun-powder do not take fire ere the shell arrives at the destined place; to prevent which, the fusée is frequently wound round with a wet clammy thread. See FUSEE.

Bombs being made of different magnitudes, it may be proper to exhibit some of their dimensions; as in the following table.

Diam. of Bomb.	Thickness of Metal.	Diam. of Apert.	Quant. of Gunpowd.	Weight of Bomb.
17 In.	2 In.	2, 10	3, 20	48 lb.
11, 8	1, 18	1, 16	15	130
8	0, 10	1, 13	4	40

Others make the thickness of the *bomb* $\frac{1}{2}$, or $\frac{2}{3}$, or $\frac{1}{3}$, of the whole diameter; and the diameter of the aperture $\frac{1}{5}$ or $\frac{1}{4}$ of the same.

Bombs only differ from *granadas*, in that the latter are much less, and instead of mortars are thrown out of the hand.

M. Blondel, who has wrote on the art of throwing *bombs*, observes, that the first *bombs* were those thrown into the city of Watchtendorch in Guilderland, in 1588; though others pretend they were in use a century before, viz. at the siege of Naples by Charles VIII. in 1495.

BOMB-BATTERY. See the article BATTERY.

BOMB-CHEST is a kind of chest filled usually with bombs, sometimes only with gun-powder, placed under ground, to tear and blow it up in the air, with those who stand on it. *Bomb-chests* were formerly much used to drive enemies from a post they had seized, or were about to take possession of; they were set on fire by means of a faucissee fastened at one end; but they are now much disused.

BOMBARD*. **BOMBARDA**, a piece of artillery anciently in use, exceedingly short and thick, and with a very large mouth, by some also called *basilic*, by the Dutch *donderbus*.

* Some derive the word, by corruption, from *lombard*, as supposing this piece first used in Lombardy: Du Cange, after Vollius, derives it from *bombus*, and *ardor*; Menage, from the German *bombarden*, the plural of *bomber*, *balista*. But we doubt whether the Germans know any such word. It is no unusual thing with Menage, and many other etymologists, to give derivations from words of their own making.

There were some of these pieces said to have carried balls of 300 pound weight; Froissart mentions one of 50 foot long. To load them, they made use of cranes, &c. The *bombarda* is supposed to have been in use before the invention of cannons.

BOMBARDIER, an engineer, or person whose business is to take care of the firing and throwing *bombs* out of mortars.—He first drives the fusée, then fixes the shell, points, loads, and fires.

BOMB-KETCH is a small vessel, strengthened with large beams, for the use of mortars at sea.

BOMBYCINUM velamentum. See VELAMENTUM.

BONA mobilia. See the article MOBILIA.

BONA notabilia, in law, where a person dying has goods, or good debts, in another diocese but within the same province, besides his goods in the diocese where he dies, amounting to the value of five pounds at least, he is said to have *bona notabilia*; in which case, the probate of his will, &c. belongs not to the bishop of the diocese where he dies, whose jurisdiction cannot extend beyond the bounds of his own diocese, but to the archbishop of the province.

BONA patria, a jury or assise of countrymen, or good neighbours. See JURY and ASSISE.

BONIS arrestandis ne dissipentur. See ARRESTANDIS.

TERRIS, BONIS, & catallis rehabendis post purgationem. See TERRIS.

Arresto facto super BONIS mercatorum. See ARRESTO.

BONORUM attachamenta. See ATTACHAMENTA.

SUMMUM BONUM. See SUMMUM.

BOND. See the articles OBLIGATION, and COUNTER-BOND.

BONE, in anatomy, a white, hard, brittle, insensible part of the body, framed for the defence of the soft parts, and the support of the whole fabric. See BODY, PART, &c.

The *bones* are all covered with a peculiar membrane, called the *periostrum*, and are most of them hollow, and filled with an oily substance called *marrow*.

Dr. Havers, describing the texture of the *bones*, observes, that they consist of lamellæ, or plates lying one upon another; and those, again, of fibres running lengthwise, some to the extremities of the *bones*, others not so far; but none of them terminating there in distinct ends, as they seem to do; but in lieu of that continued transverfly, and as it were arched: the fibres of one side meeting and uniting with those of the other; and this at each extremity. So that the fibres are a continuation of each other; though not in the same uniform order, but in very long ellipses; not all of a length, however, but in each plate, shorter and shorter than other.

These lamellæ, or plates, are differently disposed in different *bones*; *v. gr.* in those that have a large cavity, they are contiguous on each side, and very closely united; in those again, whose cavities are small, or which are altogether spongy within, many of the internal laminae are placed at a distance from each other, having betwixt them little *bony* cells; and even in *bones* that have a larger cavity, some of these lesser cells are usually found at each extremity. In such *bones* as have their plates contiguous, there are pores through and between the plates, besides those made for the passage of the blood-vessels: the first penetrate the laminae transverfly, and look from the cavity to the external surface of the *bone*; the second run longitudinally between the plates; the first are found in every lamina; though the nearer the cavity, the greater the number of pores; but they do not lie directly over one another, so as to form any continued passage from the cavity to the surface. The second are seldom found but by good glasses: a medullary oil is diffused, by these, throughout the plates; and to those, the first kind seems only subordinate; serving to bring the oil into them.

The marrow in the cavity of the *bones* is invested with a membrane, wherein are included little bags, or lobules; and in these bags are vesiculæ, or glandulous bladders, serving both for the secretion of the medullary oil from the blood, and for the reception and conservation of the same. They seem to have passages into each other, as have also the bags; whereby the oil has a freer course to the joints and substance of the *bone*. The use of the marrow is to oil the substance of the *bone*, and to prevent its being too dry and brittle; it also lubricates the articulation of the *bones*, and hinders their ends from being worn, or overheated with motion; and it moistens the ligaments by which they are tied to each other: in which it is assisted by the mucilaginous glands, found in all the articulations of the *bones*.

The *bones* are generally bigger at their extremities than in the middle; that the articulations might be firm, and the *bones* not so easily dislocated: to that to render the middle of the *bone* strong withal, so as to sustain its allotted weight, and resist accidents, the fibres are there more closely compacted together, and support one another: to which it may be added, that the *bone* being hollow, is not so easily broken, as if it had been solid and smaller: for of two *bones* of equal length, and of equal numbers of fibres, the strength of the one to the strength of the other will be as their diameters.

The *bones* are joined and connected together various ways, according to the various purposes they are to serve: some being intended for motion, others for rest, and the support of the incumbent parts only.—That jointure intended for motion, is called *arthrosis*, or articulation; that for rest, *symphysis*, or coalition.

Articulation is divided into two kinds, *diarthrosis*, and *synarthrosis*; and each of these again subdivided into several others. See ARTICULATION, DIARTHROSIS, &c.—*Symphysis* is divided into *future*, *harmonia*, and *gomphosis*.—Besides which there are five other kinds of connection, viz. *syssarcosis*, *synchondrosis*, *synneurosis*, *syntenosis*, and *synmyosis*. See SYMPHYSIS, SYSSARCOSIS, &c.

The number of the *bones* is various in various subjects; ordinarily it is about 242; some say 300; others 307; others 318: but the later writers fix it at 249 or 250; 61 of which are in the head, 67 in the trunk, 62 in the arms and hands, and 60 in the legs and feet: the variations are in the number of the sesamoidæ, the teeth, and the sternum.

The names of the several bones are given in the following table; their figures, and places are represented in *Tab. Anatomy P. 1.* (Osteology) and particular descriptions of each are given under their proper heads.—

Christianity, and the like: by which a library might be composed of none but the best books of each kind.—For this purpose we have the sentiments of many authors of established reputation on the most considerable writers, in Sir Tho. Pope-Blount's *Censura celeberrimorum auctorum*, which may be of use to direct one's choice. But, to be more express,

The history or *notitia* of Books makes the first part, according to some, the whole of the literary science.—The principal points in the *notitia* of a book, are, its *author*, *date*, *printer*, *edition*, *versions*, *comments*, *epitomes*, *successes*, *eulogies*, *censures*, *condemnation*, *suppression*, *adversaries*, *vindicators*, *continuator*, and the like.

The history of a book is either of its *contents*, which is given by analysing it, as is done by journalists; or of its *appendages and accidents*, which is the more immediate province of those called *literators*, and *bibliotbecarians*.

The *contents* of a book are the matters delivered in it; which make the province of the author.—Of these there is one principal matter, called the *subject*; in respect of which the rest are only *incident*s.

The *appendages* of a book are, the *title*, *preface*, *epistle dedicatory*, *summaries*, *table of contents*, *index*, and the like, which are the proper province of the editor, unless perhaps the title-page, which is frequently usurped by the book-seller.

In the *composition* of a book, there occur *sentiments*, which are also the materials of it; *method*, the order wherein these are disposed; and *style*, or *expression*, which is the language wherein they are clothed.

The giving histories, catalogues and bibliotheca's of books, is said to have been first introduced by the Germans: we may add, that it is they who have best succeeded in them; and to whom the chief works of this kind are owing.—J. Alb. Fabricius has given us the history of the Greek and Latin books: Wolfius that of the Hebrew books: Boecler, of the principal books in each science and faculty: Struvius, of the books of history, law, and philosophy; the abbot Fabricius, of the books in his own library: Lambecius, of those in the Vienna library: Le Long, of the books of scripture: Mattaire, of the books printed before the year 1550, &c.—*Vid.* Reimm. *Bibl. Aetnaea* in *præf.* §. 1. p. 3. *Vol. Introduct. ad Not. Script.* Ecclæs. c. 4. §. 13. p. 124. *seq.*

Burning of Books was a kind of punishment much in use among the Romans, by legal sentence: sometimes the care of the execution was committed to triumviri appointed on purpose; sometimes to the prætors, and sometimes to the ædiles; Labienus, whom from his satirical spirit some have called *Rabienus*, is said to have been the first, who underwent the severity of it. His enemies procured a *senatusconsultum*, whereby all his books, published during several years, were ordered to be collected and burnt: "The thing," (says Seneca) then appeared new and strange, to take revenge on "learning!" *Res nova & injusta! Supplicium de studiis sumi*." Cassius Servius, a friend of Labienus, hearing the sentence pronounced, cried aloud, "That they must burn him too, "since he had got all the books by heart!" *Nunc me vivum uri oportet, quia illos didici.* Labienus could not survive his books, but shutting himself up in the tomb of his ancestors, pined away, and was buried alive.—*Vid.* Tacit. *Agrie.* c. 2. n. 1. *Valer. Max.* l. 1. c. 1. n. 12. *Tacit. Annal.* l. 4. c. 35. n. 4. *Senec. Controv.* in *præf.* §. 5. *Rhodig. Ant. Lect.* c. 13. l. 2. Salmuth *ad Pancerol.* p. 1. tit. 22. p. 68. *Pitisc. L. Ant.* T. 2. p. 84. Divers other ancient testimonies concerning the burning of books are given in Reimm. *Idea Syst. Antig. Liter.* p. 389. *seqq.*

For the matter of Books.—They were first written on stones, witness the Decalogue given to Moses, (which is the oldest book we have any warranted account of); then, on the parts of plants, *e. gr.* the leaves, chiefly of the palm-tree; the rinds and barks, especially of the tilia, or philyna, and the Egyptian papyrus*. By degrees, wax, then leather were introduced, especially the skins of goats and sheep, of which at length parchment was prepared: then lead came in use; also linen, silk, horn, and lastly paper itself.—*Vid.* Calm. *Diff.* 1. *for Genes. Comment.* T. 1. ejusd. *D. Bibl.* T. 1. p. 316. *Du Pin Bibl. Ecclæs.* T. 10. p. 381. *Barthol. de legend. libr.* diff. 4. p. 70. *seqq.* *Hist. Acad. R. Infer.* T. 3. p. 103. *Schwartz de Ornam. libr.* diff. 1. Reimm. *Idea Syst. Antig. Liter.* p. 235. & 286. *seq.* *Montfauc. Palæogr.* l. 2. c. 8. p. 180. *seq.* *Gulland Papyr. Memb.* 3. See also the article PAPER.

* The parts of vegetables continued long the common matter of books; inasmuch that most of the names and terms belonging to books, in most languages, are taken thence: as the Greek *biblos*, the Latin *liber*, *codex*, *folium*, *tabula*, and the English book itself.—We may add, that vegetable barks appear still in some measure retained for books in certain of the Northern countries, as among the Calmuc Tartars, where a library was lately discovered by the Russians, of an unusual form as well as matter; the books were exceedingly long, but of no breadth; the leaves very thick, and made of barks of trees, smeared over with a double varnish; the ink or writing being white on a black ground.—*Vid.* *Hist. Acad. R. Infer.* T. 3. p. 6.

The first books were in form of blocks and tables, of which we find frequent mention in scripture, under the appellation

spher, which the septuagint render *αἶνες*, *q. d. square tables*; of which form the book of the covenant, book of the law, book or bill of divorce, book of curses, &c. appear to have been*.—As flexible matters came to be wrote on, they found it more convenient to make their books in form of rolls, called by the Greeks *ροῦλα*, by the Latins *volumina**, which appear to have been in use among the ancient Jews, as well as Grecians, Romans, Persians, and even Indians. And of such did the libraries chiefly consist, till some centuries after Christ.—The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, among the ancients; having been invented by At-talus, king of Pergamus, the fame who also invented parchment: but it has now been so long in possession, that the oldest manuscripts are found in it. Montfaucon assures us, that of all the ancient Greek MSS. he has seen, there are but two in the roll form; the rest being made up much after the manner of the modern books.—*Vid.* Calm. *lib. cit.* *Du Pin Bibl. Ecclæs.* T. 10. p. 382. *Barth. de Libris legend.* diff. 4. p. 95. *seqq.* *Montfauc. Palæogr. Græc.* l. 1. c. 4. p. 26. Reimm. *Idea Syst. Antig. Liter.* p. 227. Item p. 242. *Schwartz de Ornam. libr.* diff. 2. See also the article BOOK-BINDING.

* The rolls, or volumes, were composed of several sheets, fastened to each other, and rolled upon a stick, or umbilicus; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus, as a handle; it being reputed a kind of crime to take hold of the roll itself. The outside of the volume was called *front*; the ends of the umbilicus *cornua*, horns; which were usually carved, and adorned likewise with bits of silver, ivory, or even gold and precious stones. The title *ἑρμαῖος*, was stuck on the outside. The whole volume, when extended, might make a yard and half wide, and fifty long.—*Vid.* Salmuth *ad Pancerol.* p. 1. tit. 42. p. 143. *seq.* *Walc. Parerg. Acad.* p. 72. *Pitisc. L. Ant.* T. 2. p. 43. *voc. libri.* *Parth. Antiqu.* l. 22. c. 18. *Schwartz de Ornam. libr.* diff. 2. Reimm. *Idea Syst. Antig. Liter.* p. 242. *seq.* Item p. 251. To which may be added divers other writers on the form and ornaments of the ancient books recited in Fabric. *Bibl. Antiq.* c. 19. §. 7. p. 607.

To the form of books belongs also the *Oeconomy* of the inside, or the order and arrangement of points and letters into lines and pages*, with margins and other appurtenances: this has undergone many varieties; at first, the letters were only divided into lines, then into separate words; which by degrees were noted with accents, and distributed by points and stops into periods, paragraphs, chapters, and other divisions. In some countries, as among the Orientals, the lines began from the right, and run to the leftwards; in others, as the Northern and Western nations, from the left to the rightward: others, as the Grecians, followed both directions alternately, going in the one and returning in the other, called *boustrophedon*.—In most countries the lines run from side to side of the page; in some, particularly the Chinese, from top to bottom. Again, the page in some is entire, and uniform; in others, divided into columns; in others distinguished into text and notes, either marginal, or at the bottom: usually it is furnished with signatures and catch-words; sometimes also with a register to discover whether the book be complete.—To these are occasionally added the apparatus of summaries, or *fidic*-notes; the embellishments of red, gold, or figured initial letters, head-pieces, tail-pieces, effigies, schemes, maps, and the like.—The end of the book, now denoted by *finis*, was anciently marked with a *ς*, called *coronis*; and the whole frequently washed with an oil drawn from cedar, or citron chips, strewn between the leaves to preserve it from rotting*.—There also occur certain formula's at the beginnings and ends of books: as, among the Jews, the word *פֶּתִיחַ*, *esto fortis*, which we find at the end of the books of Exodus, Leviticus, Numbers, Ezekiel, &c. to exhort the reader to be courageous, and proceed on to the following book*.—The conclusions were also often guarded with imprecations against such as should falsify them; of which we have an instance in the Apocalypse*.—The Mahometans for the like reason place the name of God, at the beginning of all their books, which cannot fail to procure them protection, on account of the infinite regard had among them to that name wherever found*.—For the like reason it is, that divers of the laws of the ancient emperors begin with the formula, *In nomine Dei**.—*Vid.* Barth. *de Libris Legend.* diff. 5. p. 106. *seqq.* *Montfauc. Palæogr.* l. 1. c. 4. Reimm. *Idea Syst. Antig. Liter.* p. 227. *Schwartz de Ornam. libr.* diff. 1. Reimm. *Idea Syst. Antig. Liter.* p. 251. *Schwartz, ubi supra* diff. 3. Reimm. l. c. p. 260. *seq.* *Fabric. Bibl. Græc.* l. 1. c. 5. p. 74. *Revel.* c. 22. v. 19. *Sale Prelim. Disc.* to *Koran*, *sect.* 3. p. 59. *Barthol. lib. cit.* p. 117.

* At the end of each book the Jews also added the number of verses contained in it, and at the end of the Pentateuch the number of sections; that it might be transmitted to posterity entire: the Masoretes and Mahometan doctors have gone farther; so as to number the several words and letters in each book, chapter, verse, &c. of the Old Testament, and the Alcoran. See MASSORA, ALCORAN, &c.

The kinds and denominations of Books are various: with regard to their use and authority, books may be divided into, —human, those composed by mere men; —divine, those sent from heaven, or dictated by God himself, containing his word and will; which latter are also called *sacred and inspired books*. The Mahometans reckon one hundred and four divine books, given by God to his prophets; viz. ten to Adam, fifty to Seth; thirty to Enoch; ten to Abraham; one to Moses, the Pentateuch (such as it was before the Jews and Christians corrupted it) another to Jesus, the Gospel; another to David, the Psalms; and another to Mahomet, the Alcoran. He that denies these, or any of them, or any part, verse, or even word of them, is deemed an infidel: and God preserve us from infidels!—They make it a criterion of a divine book, that God himself speak in it, not others concerning God, in the third person; as it does in our books of the old and new testament, which they therefore reject as compositions merely human.—*Vid. Reland. de Relig. Mahom. l. i. c. 4. p. 21. seq.* *Id. ibid. l. 2. §. 26. p. 231.*

Sibylline Books are those composed by certain pretended prophetesses, deposited in the capitol, under the care of dumviri.—*Vid. Lomei. de Biblioth. c. 13. p. 377.* See also **SIBYL.**

Canonical Books are those received and allowed by the church, as parts of holy scripture.—Such are the books of the old and new testament.

Apocryphal Books, those excluded out of the canon, yet received and read in churches.

Authentic Books, those which are decisive, and of authority: such, in the civil law, are the code, digest, &c. in our law, the statutes, &c.—*Vid. Bac. de Augm. Scient. l. 8. c. 3. Works T. i. p. 257.*

Auxiliary Books, those less essential, yet of use as subservient to the others: as, in the study of the law, books of institutes, formulae, maxims, reports, &c.

Elementary Books, those which deliver the first principles of sciences: such are those under the titles of rudiments, methods, grammar, &c. by which they stand contradistinguished from books of a superior order, which aim at making further advances in the sciences.—*Vid. Mem. de Trev. an. 1734. p. 804.*

Library Books, such as are not ordinarily read over, but turned to, and consulted occasionally: such are dictionaries, comments, corpus's, thesaurus's, &c.

Exoteric Books, those intended for the use of popular and ordinary readers.

Acroamatic Books, those containing more secret and sublime matters, calculated for adepts and proficient in the subject.—*Vid. Reimm. Idea Syst. Antig. Liter. p. 136.*

Prohibited Books, those condemned and forbidden by the superiors of the church, as either containing matters of heresy, or things contrary to good morals.—*Vid. Bingham. Orig. Eccles. l. 16. c. 11. §. 11. Pafch. de Var. Mod. Mor. Trad. c. 3. p. 2507.* Trev. D. Univ. T. 3. p. 1507. Pfaff. Introd. Hist. Theol. T. 2. p. 65. Heuman. Via ad Hist. Lit. c. 4. §. 63. p. 163. See also the article **INDEX.**

Public Books, libri publici, the records of past times and transactions kept by public authority.—*Vid. Calv. L. Jur. p. 534. voc. Libri.* Trev. D. Univ. T. i. p. 1509. See also **ACTS, &c.**

Church Books, or ecclesiastical books, those used in the public offices of religion.—Such in the Latin church, are the sacramentary, antiphonary, lectionary, psalter, evangelary or evangelistary, ordo, missal, pontifical, ritual, processional, breviary, rosary, &c.—In the Greek church, the menologium, euchologium, tropologium, &c.—Also, the book of peace, liber pacis, which is a book given to be killed in the ceremony of the mass.—The music-book, containing the psalms, troparies, and other prayers of that kind, which are used to be sung, with the notes marked to each.—Book of liturgies, liber liturgiarum, containing not all the liturgies of the Greek church, but only the four now in use; viz. the liturgy of St. Basil, of St. Chrysostom, that of the prebaptized, and that of St. James, which is only used in the church of Jerusalem, and that but once a year.—*Vid. Pfaff. Introd. Hist. Theol. l. 4. §. 8. T. 3. p. 287.* Trev. D. Univ. T. 3. p. 1507. *Id. ibid.*

The English church-books, in use in the middle of the tenth century, as enumerated in Elfric's canons, were the bible, psalter, psalter-book, (i. e. epistles) gospel-book, mass-book, song-books, (elsewhere called antiphonary) hand-book, (or manual) kalender, passionnal, (or martyrology) penitential, and the lesson-book.—*Vid. John. Eccles. Laws. An. 957. §. 21.**

* By 3 and 4 Ed. 6. c. 10. Popish books (under the names of antiphonars, couchers, grailes, journals, legends, manuals, missals, ordinals, pies, porraisses, primers, processional) are abolished.—But it is doubted whether this statute be in force, because repealed by 1 M. c. 2. for, though 1 M. was once repealed, and not since revived by special words, it may be questioned whether it be now in force.

The Jewish church-books, were the books of the law, the hagiographas, the prophets, &c.—See **PENTATEUCH, PROPHET, and HAGIOGRAPHAS.**—The first was also called the book of Moses, because composed by him; and the book of the covenant, because the terms thereof were contained in

it. In a more absolute sense, book of the law denotes Moses's original or autograph, found in a hole of the temple in king Josiah's time.

Books, again, with regard to their scope and subject, may be divided into—historical, those which relate facts, either of nature or mankind—dogmatical, those which lay down doctrines, or general truths—miscellaneous, those of a neutral kind, containing both facts and doctrines—historico-dogmatical, and those which only rehearse doctrines, or at most indicate the arguments by which they are proved, as Mallet's geometry;—scientifico-dogmatical, those which not only recite the doctrines, but demonstrate them; as Euclid's Elements.—*Vid. Wolf. Phil. Rat. sect. 3. c. 1. §. 744; 750, 751, &c.*

Pontifical Books, libri pontificales, ιερατικά βιβλία; among the Romans, were those appointed by Numa to be kept by the pontifex maximus; describing all the ceremonies, sacrifices, feasts, prayers, and other religious matters, with the manner and circumstances, wherewith each was to be celebrated: these were also called, indigitamenta, as containing the names of all the gods, and the occasions, and formula's of invoking each.—*Vid. Liv. l. 1. p. 23. Lomei. de Bibl. c. 6. p. 107: Pitisc. L. Ant. T. 2. p. 85, voc. Libri.*

Ritual Books, libri ritualis, those which directed the order and manner of founding, building, and consecrating cities, temples, and altars; the ceremonies belonging to walls, gates, tribes, curiae, camps, and the like.—*Vid. Lomei. lib. cit. c. 6. p. 111. Pitisc. ubi supra.*

Augural Books, libri augurales, called by Cicero *, reconditi, were those wherein the science of foretelling futurity from the flight and chattering of birds were contained.—*Vid. Cic. Orat. pro domo sua ad pontif. Serv. ad Æn. l. 5. vi 738. Lomei. lib. cit. c. 6. p. 109.*

Auspicious Books, libri auspiciini, those wherein the mysteries of divining from the entrails of victims were preferred.—*Vid. Lomei. ubi supra c. 6. p. 111.*

Acherontic Books, libri Acherontici, those wherein the ceremonies and discipline of Acheron were contained; sometimes also called libri Etrusci, as being supposed to have been composed by Tages the Etrurian, though others pretend that he had received them from Jupiter himself: some suppose these to have been the same with the libri fatales; others, with the libri aruspiciini.—*Vid. Serv. ad Æn. l. 8. v. 398. Lomei. de Bibl. c. 6. p. 112. Pitisc. l. c. p. 84. Lindendrog. ad Censorin. c. 14.*

Fulgural Books, libri fulgurales, those written touching thunder and lightning, and the interpretation thereof.—As that composed by the Tuscan nymph Bigois, preserved in the temple of Apollo.—*Vid. Serv. ad Æn. 6. vi 72. Lomei. de Bibl. c. 6. p. 111.*

Fatal Books, libri fatales, those wherein the ages, or terms of the life of men were written, according to the Etrurian discipline. These were consulted by the Romans in all public calamities; and instructions taken from them, how to expiate the offended deities.—*Vid. Censor. de die Natal. c. 14. Lomei. lib. cit. c. 6. p. 112. Pitisc. ubi supra, p. 85.*

Black Books, those which treat of necromancy and witchcraft.

The same denomination is also given to some other books, on account of the colour of their backs, or the diffuseness of their contents; whence also red book, and duns/day book.

Good Books, in the common usage, are those of devotion and piety; as colloquies, meditations, prayers, &c.—*Vid. Shaftesb. Charact. T. i. p. 165. Item. T. 3. p. 327.*

A good book, in the bookellers language, is a saleable one; in the language of the curious, a scarce one; in that of men of sense, an useful and instructive one.

Among five principal things which Rabbi Akiba recommended to his son, one was, that if he studied the law, he should take care to do it in a good book, lest he should be obliged to unlearn all again.—*Vid. Cren. de Furib. Librar. Sec. also, further on, the head of judging and chusing of Books.*

Spiritual Books, those which treat more expressly of the spiritual or christian life, and the exercises thereof, as contemplation, &c.—Such are those of St. John Climax, St. Francis de Sales, St. Theresa, Thomas a Kempis, Grana densis, Dr. Horneck, &c.

Profane Books, such as do not treat of matters of religion. See **PROFANE.**

Books, with regard to their authors, may be divided into—**Anonymous**, those without any author's name.—**Cryptonymous**, those whose authors names are concealed in some anagram, or the like.—**Pseudonymous**, those which bear false names of authors.—**Psephomane**, those published after the author's death.—**Genuine**, those really written by the persons whom they pretend for their authors, and still remaining in the state wherein they were left by them.—**Spurious**, or **supposititious**, those pretending to be written by others than their real authors.—**Interpolated**, those wherein their composition have been corrupted by spurious additions or insertions.—*Vid. Pafch. de Var. Mod. Moral. Trad. c. 3. p. 287. Heuman. Via ad Hist. Liter. c. 6. §. 40: p. 334.*

Books, with regard to their qualities, may be divided into—*Clear or perspicuous*, which, in the dogmatical kind, are those where the authors define all their terms accurately, and keep strictly to those definitions in the course of their works.—*Obscure*, those where words are used vaguely, and without defining.—*Prolix*, those which contain more things than were necessary to the author's design: as, if in a book of surveying a man should give all Euclid.—*Useful*, those which deliver things necessary to be known, either in other sciences, or in the business of life.—*Complete*, those which contain all that is known concerning the subject.—*Relatively Complete*, those which contain all that was known on the subject, at a certain time; or, if a book were written with any particular design or view, it may be said to be complete, if it contain neither more nor less than is necessary for the accomplishing that end.—In the contrary cases, books are said to be incomplete.—*Vid.* Wolf. *Lag.* §. 815, p. 818, 820, 825, &c.

Books, with regard to the matter they consist of, may be divided into—*Paper-books*, those written either on linen and cotton paper, or on the papyrus, of which last kind few are now remaining.—*Vid.* Montfaucon. *Palaeogr. Græc.* l. 1. c. 2. p. 14. *seq.* See also **PAPER**.

Parchment-Books, *libri in membrana*, those written on skins or pelts, chiefly of sheep. See **PARCHMENT**.

Linen Books, *libri linei*, among the Romans were those wrote on blocks or tables covered with a linen cloth.—Such were the Sibylline books, and divers ancient laws, epistles of princes, leagues, annals, &c.—*Vid.* Plin. *Hist. Nat.* l. 13. c. 2. Dempst. *ad Rosin.* l. 3. c. 24. Lomèi. *de Bibl.* c. 6. p. 106.

Leathern Books, *libri in coria*, mentioned by Ulpian*, are by Gaiandinus taken for such as were written on barks, different from that usually wrote on; which was the tiliu^b: by Scaliger, with more probability, for such as were written on certain skins, or certain parts of skins, different from those commonly used, which were the pelts or back parts of sheep.—*Vid.* Ulp. l. 52. ff. de *Leg.* 3. ^b Guiland. *Papyr. membr.* 3. n. 50. Salmuth. *ad Pancirol.* P. 2. tit. 13. p. 253. ^c Scalig. *ad Guiland.* p. 17. Pitific. *L. Ant.* T. 2. p. 84. *voc. Libri*.

Block Books, *libri in schedis*, those written on wooden planks or tablets, smoothed for that purpose with an ascia and plane.—Such were the ordinary books among the Romans.—*Vid.* Pitific. *loc. cit.*

Waxen Books, *libri in ceris*, mentioned by Pliny, have occasioned some dispute. Herm. Barbarus suspects the term to be a corruption, and inclines to read in *schedis* instead of it, on the authority of some ancient MSS. Others see no need of the emendation, since it is known the Romans sometimes covered their planks, or schedæ, with a thin skin of wax, to make them susceptible of erasements, and amendments; which the *libri in schedis* were not, and consequently were less fit for works that required elegance and accuracy than the waxen ones, which are also called *cerae*, or *libri cerei*.—*Vid.* Pitific. *ubi supra*.

Elephantine Books, *libri elephantini*, according to Turnebus, were those written on thin slices or leaves of ivory^a; according to Scaliger, those made of the guts of elephants^b; according to others, those wherein the acts of the senate relating to the emperors were written^c; according to others, certain huge or bulky books, consisting of 35 volumes, containing all the names of the 35 tribes.—*Vid.* Salmuth. *ad Pancirol.* P. 2. tit. 13. p. 255. Guiland. *Papyr. membr.* 2. n. 48. ^b Scalig. *ad Guiland.* p. 16. ^c Calv. *L. Jur.* p. 534. *voc. Libri*. ^d Fabric. *Descript. Urb.* c. 6. Donat. *de Urb. Rom.* l. 2. c. 23. Pitific. *L. Ant.* *loc. cit.* p. 84. *seq.*

Books, with regard to their manufacture and commerce, may be divided into—*Manuscript*, those written with the hand, whether originally by the authors, called *autographs*, or at second hand by librarii or copists. See **MANUSCRIPT**, **LIBRARIUS**, &c.—*Printed*, those wrought off from the press. See **PRINTING**.—*Books in quires or sheets*, those not bound or stitched.—*Books in folio*, those wherein a sheet is folded but once, or makes two leaves, or 4 pages: *Books in 4^{to}*, where it makes four leaves; in 8^{to}, where eight; in duodecimo, where twelve; in 16^{to}, where sixteen; in 24^{to}, where twenty-four.

Books, with regard to circumstances and accidents, may be divided into—*Lost*, those which have perished by the injuries of time, or the malice or zeal of enemies.—Such as are divers even of the ancient books of scripture, written by Solomon, and others of the prophets.—*Vid.* Fabric. *Cod. Pseudepigr. Vet. Test.* T. 2. p. 171. Joseph. *Hypomn.* l. 5. c. 120. *ap. Fabric.* *lib. cit.* p. 247.

Premised Books, those which authors have given expectations of, which they have never accomplished.—Janf. ab Alne-loeven has given a bibliotheca of books promised, but still latent, or not published.—*Vid.* Struv. *Introd. ad Notit. Rei. Liter.* c. 8. §. 21. p. 754.

Fictitious Books, those which never existed.—Such is the book *de tribus Impostoribus*, so much talked of by some, supposed to be by others: to whom may be added, divers feigned titles of books^a in Baillet^b and others. Loecher^c has published a great number of plans or projects of books, many of them good and useful enough; if there were but books written to them.

M. Dugono has a whole volume of *schemes or projects of books*^a, containing no less than 3000.—*Vid.* Falch. *de Var. Mod. Mor. Trad.* c. 3. p. 282. ^b Baill. *des Satyr. Personel.* ^c Loecher. *Arcan. Liter.* ^d Projets Littéraires. ^e Jour. Liter. T. 1. p. 470.

Books in Ana, Anti, &c. See the articles **ANTI**, **ANA**, &c. *The Scope or Design of Books* is various; it is to trace the origins of things discovered; of others, to fix and establish some truth, or raise some doctrine to a higher pitch of sublimity; of others, to remove some scruple or prejudice which had before obtained, or fix more accurate and precise ideas of things; of others, to explain the names and words used in different nations, ages, and sects; of others, to improve our knowledge of facts, and events, and shew the order and ways of providence: lastly, others aim at divers, or all of these ends.—*Vid.* Loecher. *de Caus. Ling. Hebr.* in *præf.*

The Uses of Books are numerous: they make one of the chief instruments, or means of acquiring knowledge: they are the repositories of laws, and the vehicles of learning of every kind: our religion itself is founded on books: without them, says Bartholin, God is silent, justice dormant, physic at a stand, philosophy lame, letters dumb, and all things involved in Cimmerian darkness.—*Vid.* Barth. *de Libr. Legend. Diff.* 1. p. 5. *Sine libri Deus jam silet, justitia quiescit, torpet medicina, philosophia manca est, literæ mutæ, omnia tenebris involuta Cimmeris.*

The elogiums which have been bestowed on books are infinite: they are represented, “as the refuge of truth, which is banished out of conversation; as standing counsellors, and preachers, always at hand, and always disinterested;” “having this advantage over oral instructors, that they are ready to repeat their lesson, as oft as we please.”—*Books* supply the want of masters, and even in some measure the want of genius and invention; and can raise the dullest persons, who have memory, above the level of the brightest, without.—An author, who wrote not inelegantly, though in a barbarous age, sums up all their praises.—*Vid.* Lucas *de Penna ap. Morhoff Polyhist.* l. 1. c. 3. p. 27. *Liber est lumen cordis, speculum corporis, virtutum magister, vitiorum depulsor, corona prudentum, comes itineris, domesticus amicus, congressus tacentis, collega & consiliarius præsentis, myrtoecium eloquentiæ, hortus plenus fructibus, pratum floribus distinctum, memoriæ penus, vitta recordationis; vocatus properet, justus festinat, semper præstest, nunquam non morigerus, rogatus confestim respondet: arcana revelat, obscura illustrat, ambigua certior, perplexa resolvit, contra adversam fortunam defensor, secundæ moderator, opes adauget, jacturam propulsat, &c.*

Perhaps their greatest glory is, the affection borne them by many of the greatest men of all ages: M. Cato*, the elder Pliny^a, the emperor Julian, and others, are on record for an excessive devotion to books. The last has perpetuated his passion by some Greek epigrams in their praise. Richard Bury, bishop of Durham, and lord chancellor of England, has a treatise expressive on the love of books^b.—*Vid.* Plin. *Epist.* 7. l. 3. ^a *Philobiblion, sive de Amore Librorum.* Fabric. *Bibl. Lat. Med. Ævi.* T. 1. p. 842. *seq.* Morhoff *Polyhist.* l. 1. c. 17. p. 190. Salmuth. *ad Pancirol.* l. 1. tit. 22. p. 67. Barth. *de lib. legend. diff.* 1. p. 13. *seq.*

* M. Catonem vidi in bibliotheca sedentem multis circumfusum Stoicorum libris. Erat enim, ut scis, in eo inexhausta aviditas legendi, nec satiarî poterat: quippe qui, ne reprehensionem vulgi inane reformidans, in ipsa curia soleret legere, sæpe domus suæ coegretur, nihil operæ reipublicæ detrahens.—*Vid.* Cic. *de Divin.* l. 3. n. 11.

The ill Effects objected to Books, are, that they employ too much of our time and attention; engage us in pursuits of no use to the common-wealth, and indispose us for the functions of civil life; that they render men lazy, and prevent their exerting their own talents, by furnishing them on every occasion with things of the growth of others; and that our natural lights become weakened and extinguished, by inuring ourselves to see only with foreign lights: besides, that ill men are hereby furnished with means of poisoning the people and propagating superstition, immorality, enthusiasm or irreligion, which will always spread faster, and be received more greedily than lessons of truth and virtue.—Many other things are added concerning the emptiness of books, and the errors, fables and follies they are fraught with; which, together with the multiplicity and perplexity of them, is such, that it may seem easier to discover truth in the nature and reason of things, than in the uncertainty and confusion of books.—Add, that books have turned the other instruments of knowledge out of doors, as experiments, observations, furnaces, and the like, without which the natural sciences can never be cultivated to purpose^a; and that in mathematics, books have so far superseeded the exercise of invention, that the generality of mathematicians are now contented to learn the solution of problems from others; which is to relinquish the chief end of their science: since what is contained in mathematical books is properly the history only of mathematics, not the science, art or talent of solving questions; which is hardly to be had from books; but only from nature and meditation.—*Vid.* Bac. *de Augm. Scient.* l. 2. *Works.* T. 1. p. 61.

For the Art of Writing or Composing Books, we have much fewer helps and instructions than for the art of speaking; though the former

former be the more difficult of the two; as a reader is not so easy to be imposed upon, but has better opportunities of detecting faults than a hearer.—A great cardinal, indeed, reduces an author's business to a few heads: were they but as easily practised as prescribed: "Let him consider who it is writes, what, how, why and to whom?" *Quis scribat, quid scribatur, quomodo, cur & ad quos.*—*Vid.* Auguſt. Valer. de caut. in eand. libr.

To write a good book, an interesting subject must be chosen, which is to be long and closely meditated on; and of the sentiments which offer themselves, those which are already commonly known are to be rejected; few or no digressions from the main points are to be allowed; quotations rarely made, and then only to prove some important truth, or embellish the subject with some beautiful and uncommon observation; never bringing an ancient philosopher on the stage to say what the meanest laquay could have said as well; nor making a sermon, unless where the business is to preach.—*Vid.* *Nouv. Rep. Lett.* T. 39. p. 427.

The conditions required in a book are, according to Salden, "Solidity, perspicuity and brevity:" the first will be best attained, by keeping the piece long by us, often reviewing and correcting it by the advice of friends: the second, by disposing the sentiments in a due order, and delivering them under proper and usual expressions: the third, by throwing every thing aside that does not immediately concern the subject.

Were these rules observed, it would scarce be possible for any, except an angel from heaven, to write many books: *Vix totidem quot Thebarum portæ vel divitis æſtia Nil.*—We should hear no more of those volatile authors, who throw off yearly six or eight books, for ten or twelve years running; of those voluminous authors, who number their books by scores and hundreds; nor of those childish authors, who publish books by that time they are able to speak.

* Severin. Lintrupius, professor at Copenhagen, has given a catalogue of seventy-two books, which he composed within the compass of twelve years: containing six volumes in theology, eleven in ecclesiastical history, three in philosophy, fourteen on miscellaneous subjects, and thirty-eight on literary subjects.—*Vid.* Lintrup. *Reliq. Incend. Berg.* ap. *Nouv. Lit. Lubec.* an. 1704. p. 247.

† Fa. Macedo, a Franciscan friar, wrote, according to his own testimony, 44 volumes, 53 panegyrics, 60 Latin speeches, 100 epigrams, 500 elegies, 110 odes, 212 epistles dedicatory, 500 familiar epistles, *poemata epice juxta his mille sexcenta*: (it is to be supposed he means 5600 poems in heroics or hexameters) and in fine 150000 verses.—*Vid.* Noris *Miles Macedon.* ap. *Jour. des Scav.* T. 47. p. 179.

‡ The young duke de Maine's works were published at seven years old, under the title of, *Ouvrages divers d'un auteur de sept Ans*, Paris, 4to. 1685.—*Vid.* *Jour. des Scav.* T. 13. p. 7.—Dan. Heinfius published his notes on Silius Italicus so young, that he entitled them his *Rattles*, *Crepundia Siliiana*. *Lugd. Bat.* 1600. 6to.—Caramuel is even said to have written a book on the sphere, before he was old enough to go to school; and what is pleasant, he took it chiefly from *Sacro Bosco's* treatise of *Sphæra*, before he had learnt a word of Latin.—*Vid.* *Baill. Enfans célèbres*, n. 81. p. 300.—We may add, that Placcius assures us, he began to make his collections, while under the tutorage of his nurse, and when he had nothing to collect out of, but his nurse's prayer-books.—*Place. de Art. Excerpt.* p. 190.

M. Cornet D. de S. used to say, that to write books, a man must be either very foolish or very wise*: there are doubtless many of both sorts in the number of authors; yet the majority seems to consist of those, who are neither the one or the other. The custom is most altered since the times of the ancients, who carried their scrupulousness in what relates to the composition of books beyond all that has been above expressed: so august was the idea they formed of a book, that nothing would suffice less than its being a treasure: *thesaurus oportet esse, non libros*; no labour, no assiduity and exactness was thought enough to fit a work for the public view: every sentiment and expression was to be maturely weighed, and turned on all its sides; and not suffered to pass, unless every word were a pearl, and every page beset with gems. So that they put the reader in possession in a single hour, of what had cost them perhaps ten years intense thought and application.—Such were those books, which were reputed *cedro digni*, to be anointed with cedar-juice, and thus rendered incorruptible, for the instruction of all future ages.—With us, the case is otherwise: the ambition of being an author possesses every body, even those who have nothing to say, or at most, only one thing, and that perhaps a trifle, and already laid by a hundred others*: to furnish out a book, we have recourse to various arts, and stratagems; a formal method is first chalked out, which like a drag-net gathers all before it, old and new, common and uncommon, good, bad, and indifferent, which we adopt with little choice; the chief attention being, with Albutius the rhetor, to say all on the subject we can, not merely all we ought.—*Vid.* Vign. de *Marv.* ap. *Trev. D. Univ.* T. 3. p. 1509. voc. *LIVRE*. * Salmuth. *ad Pancirol.* P. 1. tit. 42. p. 144. *Guiland. de Polyg. membr.* 24. *Reimm. Idea Syst. Ant. Liter.* p. 296. * Bartholi de l' *Harmonia de Liter.* P. 2. p. 318. * Barthol. lib. cit. diff. 5. *Cum Albutio rhetore de omni causa scribere, non quæ debeant, sed quæ poterant.*

VOL. I.

A modern author, let his subject be what it will, generally takes occasion to retail his whole stock of knowledge then on hand: if he write, for instance, on the gout, as M. Aignan, he will give you the nature of all diseases, and their cures, and perhaps a system of physics into the bargain, and over and above many important doctrines of theology, and rules of morality*: if, on the building of Solomon's temple, as Caramuel, he will not confine himself to architecture, but treat of numerous matters relating to theology, mathematics, geography, history, grammar, &c. Inomuch, that if we may believe the author of a piece inserted in Caramuel's work, if God should permit all the sciences in all the universities in the world to be lost, they might be restored by means of this book alone.—*Vid.* Aignan *Traité de la Goutte*, Par. 1707. 12°. *Jour. des Scav.* T. 39. p. 421. seq. * *Archit. civil.* 1680 y obliqua consid. en el templ. de Jersuf. 3 vol. folio. *Vegeu.* 1678. *Jour. des Scav.* T. 10. p. 348, seq. *Nouv. Rep. Lett.* T. 1. p. 103.

He sets out with a tedious preamble, perhaps foreign to the question; and thence proceeds on to a digression, this gives rise to a second; which carries him such a length, that we lose sight of him: he oppresses us with proofs of things that needed none; makes objections no body would have thought of, and to answer them is sometimes forced to make a dissertation in form, to which he gives a particular title, and to lengthen it out, subjoins the plan of some future work, wherein he will treat the point more at large. Sometimes he argues in form, accumulates syllogism on syllogism, and induction on induction; being careful to note that they are so many geometrical demonstrations. At length you come to a string of consequences, which you never expected; and after twelve or fifteen corollaries, wherein contradictions are not spared, you are surprised for the conclusion to find a proposition which had never been mentioned, or at least had been utterly put out of your head, or perhaps one which has no relation to the subject.

The subject of the book, in all probability, is some trifle; perhaps the use of the particle, *and*, or the pronunciation of the Greek *eta*, or the praise of an ass, or a louse, or a shadow, or folly, or idleness, or the art of drinking, or loving, or dressing; or the use and abuse of spurs, or shoes, or gloves, or the like.—Suppose, for instance, it be the last, and let us see how a modern writer of note proceeds to make his book.

—For method he takes that of the Lullists, and begins with the name and etymology of *glove*; which he gives not only in the language he writes in, but in all the languages he understands, or of which he has dictionaries in his study, oriental or occidental, living or dead; accompanying each with its respective etymon, and sometimes too with its compounds and derivatives, and referring for more thorough knowledge to the several dictionaries from whence he took them; always, most religiously quoting chapter and page. From the name he proceeds at length to the thing, and passes with great pains and exactness through all the common places of arguments, as the matter, form, use, abuse, adjuncts, conjuncts, disjuncts, &c. of gloves. On each of which he does not confine himself to give us what is new, singular, or some way uncommon, but thinks himself obliged to exhaust his subject, and give us all he can find. Thus gloves, he informs us, preserve the hands from cold; and proves, that if we go much in the sun without them, our hands will be tanned. He goes on next to show, how chaps on the hands will ensue in winter, if we leave our gloves at home; and how painful as well as unsightly a thing chapped hands are.—Yet must this be allowed an author of merit, and far from being singular in his method of writing. In reality, we all do the same thing, some in a greater degree, and some in a less, with good Mr. Nicolai.—*Vid.* Nicolai *Disquis. de Chirobecarum Usu & Abusu.* Giesff. 1702. 12mo. *Nouv. Rep. Lett. Aut.* 1702. p. 158. seqq.

The form or method is the spirit or archæus that directs all: one writer supposes his book to be a candle-stick, and every chapter a socket*; another reduces his work to the form of a pair of folding-doors, which open into two parts, to admit the reader into a dichotomy*. Mr. Waltherus considers his book, *officina biblica*, as a shop, and divides or ranges the materials of it accordingly, on so many shelves, treating his reader throughout as a customer. Another turns his book into a tree, with its trunk, branches, flowers, and fruits; the twenty-four letters of the alphabet being the branches; the several words the flowers, and 120 sermons the fruit*.—*Vid.* Wolf. *Bibl. Hebr.* T. 3. p. 987. * R. Schabtai *Labra Dormientium.* ap. Wolf. lib. cit. Item T. 1. in pref. p. 12. * Cassian. a S. Elia, *Arbor omnium opinionum moralium, quæ ex trunco pullulant, tot ramis quot sunt literæ alphabetæ, cujus flores sunt verba, fructus sunt 120 conciones*, &c. *Venet.* 1688. fol. *V. Giorn. de Parma*, an. 1688. p. 60.

For the origin of Books, we have nothing that is clear: the books of Moses are doubtless the oldest of all that are extant; but there were books before those of Moses, who cites several: Scipio Sgambati, and others*, even talk of books before the deluge, written by the patriarchs Adam, Seth, Enos, Cainan, Enoch*, Methusalem, Lamech, Noah and his wife, also by Ham, and Japhet and his wife, besides others by the de-

mons or angels; of all which some moderns have found enough to fill an antediluvian library: but they appear all, either the dreams of idle writers, or the impostures of fraudulent ones.—*Id. Mem. Acad. R. Inscr. T. 6. p. 32. Id. ibid. T. 8. p. 18. Sgambat. Archiv. Vet. Test. Fabric. Cod. Pseudep. V. Test. passim. Heuman. Via ad Hist. Liter. c. 3. §. 3. p. 29.*

* A book of Enoch is even cited in the epistle of Jude v. 14. and 15: from which some endeavour to prove the reality of antediluvian writings; but the book cited by that apostle is generally allowed both by ancient and modern writers to be spurious.—*Id. Saalbach. Sched. de Libr. Vet. §. 42. Reimm. Idea Syst. Ant. Liter. p. 233.*

Of profane books, the oldest extant are Homer's poems, which were even so in the time of Sextus Empiricus²; though we find mention in Greek writers of about seventy others prior to Homer, as Hermes, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c. but of the greater part of these, there is not the least fragment remaining; and of the others, the pieces which go under their names are generally held by the learned supposititious.—F. Hardouin goes farther; charging all the ancient books, both Greek and Latin, except Cicero, Pliny, Virgil's georgics, Horace's satires and epistles, Herodotus, and Homer, as spurious, and forged in the thirteenth century, by a club of persons under the direction of one Severus Arcontius³.—*Id. Fabric. Bibl. Græc. l. 1. c. 1. §. 1. T. 1. p. 1. Id. ibid. §. 6. p. 4. Hardouin. de Numm. Herodias. in Prolus. Act. Erud. Lips. an. 1710. p. 70.* Among the Greeks, it is to be observed, the oldest books were in verse, which was prior to prose: Herodotus's history is the oldest book extant of the profane kind⁴.—*Id. Strabo Geogr. l. 1. Heuman. lib. cit. §. 20. p. 50. Id. ibid. §. 21. p. 52.*

The multitude of Books has been long complained of: they are grown too numerous, not only to procure and read, but to see, learn the names of, or even number. Solomon, three thousand years ago complained, that "of writing books there was no end." But modern writers cannot keep within terms of so much moderation: "You may sooner empty the sea, says one, than exhaust the immense ocean of books, or number the sands on the shore than the volumes extant. They are not to be told, says another, though like an inhabitant of Mahomet's paradise, a man had seventy thousand heads, and to each head seventy thousand mouths, and to each mouth seventy thousand tongues, which each spoke seventy thousand languages."—Yet how is the number continually increasing! When we consider the multitude of hands employed in writing, of copists throughout the east in transcribing, and of presses in the west continually pouring in fresh quantities, it seems a kind of miracle the world should be able to contain them! England has more to fear on this score than other countries; since besides our own produce, we have for some years past, drained our neighbours. The Italians and French make great complaints that their best books are carried out of the country by foreigners: "It seems, say they, to be the fate of the provinces which composed the ancient Roman empire, to be plundered by the northern nations: once they they conquered and took possession of the country; of late, they leave the inhabitants their lands, and only take their learning." *Commigrant ad nos quotidie (cries Sig. Faccioli) callidi homines pecunia instructissimi & præclarum illam musarum supellectilem, optima volumina, nobis abripiunt. Artes etiam, ac disciplinas paulatim abstrahuntur aliis, nisi studio & diligentia resistatis.*—*Id. Barth. de Libr. legend. diff. 1. p. 7. Heuman. Via ad Hist. Liter. c. 6. §. 43. p. 338. seqq. Faccioli. Orat. 1. Mem. de Trev. an. 1730. p. 1793.*

Elementary books seem the least to need to be multiplied; since a good grammar, or dictionary, or institutions of any kind, seems hardly to admit of a second in one age, or even in many ages. Yet it has been observed, that in France alone, within the compass of thirty years, there have appeared no less than fifty new elements of geometry, as many treatises of algebra, as many of arithmetic, and as many of surveying and measuring; it is added, that within the space of fifteen years, there have been above a hundred French and Latin grammars published in the same country; and of dictionaries, abridgments, methods, &c. in proportion: all which are but an eternal round of the same things, the same ideas, same discoveries, same truths, same falsehoods.—*Vide Mem. de Trev. an. 1734. p. 804.*

The best of it is, we are not obliged to read them all: Thanks to providence, the good bishop Caramuel's scheme miscarried, which was, to write about an hundred volumes in folio, and then prevail on the civil and spiritual powers to oblige all their subjects to read them. Ringelberg had laid the schemes of no less than a thousand several books, which he alone was to have composed, had he lived long enough⁵; and apparently would not have been less eager in obtruding them on the public. Had the same thought entered Hermes Trifmegistus, who, according to the account given by Jamblichus, wrote 36525 books, people would have had much more reason to complain of the multitude of books than they now have.

—*Id. Baill. Enfans Celebr. sec. 12. Jugem. des Scav. T. 5. P. 1. p. 373.*

In reality, there are few of the immense number of books which deserve seriously to be studied: for the rest, part of them are only to be occasionally consulted, and the rest read for amusement. A mathematician, for instance, ought not to be entirely ignorant of what is contained in the mathematical books; but then a general knowledge is sufficient, which may easily be had by running over the chief authors; out of whom references may be made, directing to the places where they may be found, when wanted. For there are many things which are much better preserved in books than in the memory; as astronomical observations, tables, rules, theorems, proportions, and in fine, whatever does not spontaneously adhere to the memory, when once known. For the less we crowd that faculty, the reader and freer will the wit remain for inventing.—*Id. Cartes Epist. ad Hagel. ap. Hook Phil. Collect. No 5. p. 144. seq.*

Thus, a few books well-chosen, and thoroughly studied, may suffice: many have even held the bible alone sufficient for all the purposes of knowledge; others, the alcoran: Cardan requires but three books for any person, who does not make a profession of learning: one, to contain the lives and acts of the saints and other virtuous men; another to amuse the mind with pleasing verses; and a third to teach the rules of civil life.—Some have only proposed two books for our study, viz. that of scripture, which discovers the will of God; and that of the creation, which shews his power; the latter of which is the key of the former⁶.—But this, under pretence of retrenching superfluities, seems to be running into the opposite extreme. The business is, rather to make a due choice among the multitude, of a number of good ones.—It may be added, that as knowledge is naturally advantageous, and as every man ought to be in the way of information, even a superfluity of books is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design.—This advantage, an ancient father observes, we owe to the multiplicity of books on the same subject, that one falls in the way of one man, and another best suits the level, or the apprehension of another.—"Every thing that is written, says he, does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service therefore, that the same questions be handled by several persons and after different methods, though all on the same principles, that the explications of difficulties, and arguments for the truth, may come to the knowledge of every one, by any way or other⁷."—Add, that the multitude is the only security against the total loss, or destruction of books: it is this has preserved them against the injuries of time, the rage of tyrants, the zeal of persecutors, and the ravages of barbarians; and handed them down, through long intervals of darkness, and ignorance, safe to our days.—*Solaque non norunt hæc monumenta mori.*—*Id. Bac. de Augment. Scient. l. 1. Works T. 1. p. 49. August. de Trin. l. 1. c. 3. Barth. lib. cit. Diff. 1. p. 8. seq.*

Choosing and judging of Books.—Authors are not well agreed on the conditions necessary to denominate a book, good. Some require only good sense in the writer, and an acquaintance with the subject; others with Salden demand solidity, perspicuity, and brevity: others think intelligence and exactness enough: the generality of critics seem to hold, that none of the perfections, which the human mind is capable of, ought to be wanting: but on this footing there is scarce any such thing as a good book; at least none which they themselves will all agree to be such⁸. The more reasonable allow a book to be very good, which has but few faults; *optimus ille, qui minimis urgetur*: at least where the good things in it exceed the bad and indifferent. Nor is a book to be called bad, where the indifferent is the prevailing part, and the good and bad are proportioned equally⁹.—*Id. Baill. Jugem. des Scav. T. 1. P. 1. c. 6. p. 19. seq. Honor. Reflex. sur les Regl. de Crit. diff. 1.*

Since the fall of the Latin tongue, authors do not seem so much to aim at the glory of writing well, as of writing good things: so that a book is commonly allowed for good, if it be happily conducted to the end which the author aimed at; whatever other faults it may have: thus a book which is not written on account of style, may be good, though the style be naught¹⁰. Thus, an historian, who is well informed, faithful, and judicious; a philosopher, who reasons justly, and on found principles; a divine, who is orthodox, and departs not from scripture and antiquity; will be allowed good in their kinds, though they be faulty in the less material things.—*Id. Baill. lib. cit. c. 7. p. 24. seq.*

And thus most books, in one respect or other, will be found good and useful; so that the choice seems difficult; not so much what to take, as what to reject¹¹. The elder Pliny used to say, there was no book so bad, but some good might be had from it: *Nullum librum tam malum esse, qui non aliqua ex parte proficiat*¹². But there are degrees of goodness; and, in many books, the good is so thin sown, that it is hardly

worth the gathering⁴; or hid so deep, or so beset with thorns, that it will not quit the cost of digging. Virgil could gather gold out of Ennius's dunghill; but every body has not the zeal, or the skill and attention necessary to do the like.—^a *Vid. Hook. Collect. N° 5. p. 127. & 135. seq.* ^b *Plin. Epist. 5. l. 3.* ^c *Reimman. Bibl. Arcam. in Pref. §. 7. p. 8. seq.* ^d *Sacchin. de Rat. Libr. Legend. c. 3. p. 10. seq.*

It is better judged in those who recommend a small number of the best books; advising us to read much, but not many: *multum legendum esse, non multa*^a. But how is the choice to be made?—^a *Vide Plin. Epist. 9. l. 7.*

To judge of a book, those who have treated of the subject, direct us to observe the title, the author's or editor's name, the number of the edition, the place where, and year when it was printed (which in old books is frequently marked at the end) and the printer's name, especially if he be a celebrated one^a; proceed thence to the preface, and look for the author's design, and the occasion of his writing: consider also his country, (each nation having its peculiar genius^b) and the person by whose order he wrote, which may sometimes be learned from the dedication: if his life be annexed, run it over, and note his profession, what rank he was of, and any thing remarkable that attended his education, studies, conversation, or correspondences with learned men: not forgetting the eulogies which have been given the author, which often occur at the beginning, or even any critique or censure, especially if made by a man of judgment. If the preface do not give an account of the method of the work, run briefly over the order and disposition of it, and note what points the author has handled, observe whether the things and sentiments he produces be trite and vulgar, or solid and fetched from greater depths. Note, whether he go in the common road, or make any innovation, and introduce any new principle. Observe also his method, whether it be a dichotomy, or according to the four causes, or any other more peculiarly adapted to the subject.—^a *Vide Barth. Diss. 4. p. 93. seq.* ^b *Baill. c. 7. p. 228. seq.* ^c *Struv. Introduct. ad Notit. Rei Liter. c. 5. §. 2. p. 338. seq.*

But it is a small number of Books we have opportunity of thus judging of, by perusing them; beside, that when we have read a book over, the judgment comes too late for many purposes: it seems necessary therefore to have other indications, whereby to prevent our being at the charge of procuring, or the pains of perusing a worthless book: divers rules of this kind are given by Baillet^a, Struvius^b, Stollus^c, and others; which though, in reality, no more than presumptions, and frequently liable to be falsified^d, are not without their use. The journalists de Trevoux objected to them all: "The shortest way, say they, to judge of a book is to read it, if you be qualified in the subject; otherwise to refer yourself to those who are so."^e Heuman is somewhat more explicit; making it a "mark that a book is good, when it is esteemed by persons intelligent in the subject it treats of; and when those who commend it receive no advantage from the applause they bestow on it, nor are leagued with the author in any cabal, for espousing any particular principle, system, or party in religion or learning."^f—*Vide Baillet. Jugem. des Scav. T. 1. p. 2. p. 121. seq.* ^g *Struv. lib. cit. c. 5. §. 3. p. 390.* ^h *Stoll. Introduct. Hist. Liter. P. 1. §. 11. p. 9.* ⁱ *Budd. de Criticis Boni Libri passim. Walc. Hist. Crit. Ling. Lat. c. 7. §. 6. p. 320.* ^j *Mém. de Trev. an. 1712. art. 17.* ^k *Heuman Confp. Reipubl. Liter. c. 6. §. 11. p. 280. seq.*

But more particularly, it is an indication that a book is good, 1^o. If the author be known to excel in that talent more immediately necessary for such a subject; or have already published any thing on the same that is esteemed. Thus we may conclude, that Julius Cæsar will teach us the art of war better than Peter Ramus; Cato, Palladius, and Columella, agriculture better than Aristotle; and Cicero oratory better than M. Varro^a: add, that it is not enough the author be skilled in the faculty, but that he be so in the particular branch of it he treats of; some, for instance, excel in the civil law, yet not in the public law: Salmassius proved himself an excellent critic in his *Exercit. Plinian.* but came much inferior to Milton in his *Defensio Regiæ*^b. 2^o. If the book be on a subject that requires great reading, it may be presumed good, if the author have a copious library, or can have access to one; or if he lived in a place where books were not wanting: though here is danger too of running into excess in quotations, especially, says Struvius, if the author be a lawyer^c. 3^o. A book which took up a long time in composing, cannot often fail of being good: Thus Villalpandus's Commentary on Ezekiel was a work of forty years: Baronius's annals of thirty; Gousset's Hebrew commentaries of thirty; Paulus Æmilius employed the same time in his history; and Vaugelas in his translation of Q. Curtius; Lamy was thirty years in his treatise of the temple: Em. Tesauro forty years in his *Idea Arguta dictionis*; and the jesuit Carra forty years in his poem called *Columbus*.—It is true, they who are so long on the same subject, rarely bring it out uniform and methodical; besides, that they are apt to flag, and grow cold in so long a pursuit: men cannot attend to the same thing for so many years without being tired; which will be

apt to shew itself in the composition: and hence it has been observed that in those large books so long about, the beginnings glow, the middle-parts are lukewarm, the latter ends frigid, *apud vastorum voluminum auctores, principia fervent, medium tepet, ultima frigent*^a. But then they must excel in the materials, which have been gathering for so long a tract of time: this is particularly observed of the Spanish writers; and is at least more commendable, than the levity and precipitancy of some of their neighbours. Not but the public are sometimes disappointed in their expectations, from writers who are so long in labour: as was the case in Chapelain's poem *la Pucelle*, in the finishing of which he spent thirty years: and concerning which we have that epigram of Monmor:

*Ille Capellani dudum expectata puella,
Post tanta in lucem tempora prodit anus.*

Some, it is certain, have carried their scrupulousness to an excess, as Paulus Manutius, who often spent three or four months in writing a single epistle; and Iocretas, who was three olympiads in writing one panegyric^a. 4^o. Books on points of doctrine by eclectic writers, are to be presumed better than those writ by the retainers to particular sects, 5^o. The age of a writer may also give some indication: books, which require labour, are usually better performed by younger persons, than those who are far advanced in years: thus, there is more life in Luther's first published pieces, than in those he wrote a little before his death: strength decays, business encreases, we trust too much to our judgment, and are not scrupulous enough in making inquiries^b. 6^o. Another indication may be taken from the author's state and condition: Thus history written by a person who was an eye-witness of what he relates, or is concerned in public affairs, or has access to the public records, or other monuments, from whence intelligence may be drawn; or who is not baffled by party, or hired by any great man, will be supposed to be good. Thus Sallust and Cicero were well able to write the history of Catiline's conspiracy, as having some concerns in it; d'Avila, de Comines, Guicciardin^c, Clarendon, &c. were present in the civil wars they describe: Xenophon, having an employment in the Spartan army, has treated excellently of that commonwealth: and Amelot de la Houffaye, by living long at Venice, was enabled to explain the secrets of their policy: Camden wrote annals of the affairs of his own time; Thuanus had correspondences with the best writers in every country; and Puffendorf had access to the public archives. So, in practical divinity, more regard is due to those who have actually discharged the office of pastors than to others; and, in literary matters, we give credit to those who have the direction of libraries. 7^o. The time or age wherein the author lived may give some light; every age having, according to Barclay, its peculiar genius and excellency^d.—*Vide Barth. de lib. Legend. diss. 2. p. 45.* ^e *Struv. lib. cit. c. 5. §. 3. p. 390.* ^f *Budd. diss. de crit. boni libri, §. 7. p. 7.* ^g *Heuman. Confp. Reipubl. Liter. p. 152.* ^h *Struv. lib. cit. §. 4. p. 393.* ⁱ *Misc. Lips. T. 3. p. 287.* ^j *Struv. lib. cit. §. 5. p. 396. seq.* ^k *Baill. c. 10. p. 396.* ^l *Baill. c. 9. p. 378.* ^m *Barth. Diss. 2. p. 43. seq.* ⁿ *Struv. §. 6.* ^o *Id. ibid. p. 45.* ^p *Struv. lib. cit. §. 15. p. 430. seq. & 404. seq.* ^q *Baill. c. 1. p. 121. seq.* ^r *Heuman Via ad Hist. Liter. c. 7. §. 7. p. 356.*

Some judge by the bulk or size of books; following the grammarian Callimachus's rule, that every great book is of course an ill one, *μυγα Βιβλιον, μυγα καιρο*^a: a single leaf of the Sibyl was doubtless preferable to the vast annals of Volulus: yet Pliny's observation will nevertheless hold true, that "a good book is so much the better by how much it is bigger."^b *Bonus liber melior est quisque quo major*^c. Martial gives us a remedy against the largeness of a book, where that is the only complaint: read but a little of it,

*Si nimis videar, seraque coronide longus
Esse liber, legito pauca, libellus ero.*

Yet is the smallness of a book a real presumption in its favour: he must be a poor author who cannot furnish a pamphlet, or loose sheets, with things curious, and written with spirit: but to support the same through a volume in folio, requires other-guise funds. In reality, in large books it is allowed a man to be sometimes dull: a heavy preamble is expected, and a series of words of course, ere you come to the business; in the prosecution of which many nodding places are likewise allowed; but smaller pieces are indulged with none of these privileges: they must immediately fall into their subject, and treat every part of it in a lively manner: the matter must be thrown close together, and either be new in itself, or in the turn which is given it.—Were the best authors of volumes in form retailed to the public piece-meal, we should complain of many flat expressions, trivial observations, beaten topics, and common thoughts, which pass well enough off in the lump.—*Vide Barth. lib. cit. diss. 3. p. 62. seq.* ^b *Plin. Epist. 20. l. 1.* ^c *Addit. in Speculat. N° 124.*

See further concerning books, in the writers on literary history, libraries, studies, learning, arts and sciences; more especially in Salden^a, Bartholin^b, Hodannus^c, Sacchinus^d, Baillet^e, Buddens^f, Saalbach^g, Putherbeus^h, Raynaudⁱ, Schufner^j, Lauffer^k, Schwartzius^l, Crenius^m, and others, who have written treatises express concerning books.—*Christ. <i>Text Book.</i>		TEXT.

Book is also used for a part or division of a volume, or large work.

In this sense we say the *book* of Genesis, the first *book* of Kings, the five *books* of Moses, &c.—The Digest is contained in fifty *books*, the Code in twelve *books*.

Books are usually sub-divided into chapters, sometimes into sections, or paragraphs: accurate writers quote chapter and book.

Book is also used for a list or catalogue of persons names. Such among the ancients were the cenforial books, *libri cenforarii*; being tables or registers containing the names of all those who were censured or taxed under Augustus, Tertullian assures us, that our Saviour's name was found in the cenforial books of Augustus.—*Vid.* Tertul. *adv. Marcion.* l. 4. c. 7. *De censu Augusti quomodo testem fideles sumum dominice natiuitatis Romana archiva custodiant.* *Vid.* Lomei. *de Biblioth.* p. 104. *Pictic. l. Ant. T.* 2. p. 84.

Books, in matter of commerce, denote the several registers wherein merchants and other dealers keep their accounts.

We say, such a person's *books* are in good order: merchants cannot possibly do without *books*; they are even obliged by the laws to keep *books*. But more, or fewer are required, according to the nature and extent of their dealings, or the precision and exactness they desire therein.—*Vid.* Savar, *D. Comm. T.* 2, p. 569. *vac. Livres.*

The ancients had also their *books* of accounts; witness the *codex accepti et expensi*, so often mentioned in Roman writers: and the patrimonial *books*, *libri patrimoniorum*, which were rentals, or terriers, containing an account of the lands, goods, and chattels, and other effects belonging to each person.—*Vid.* Senec. de Benef. l. 7. c. 10. Meurli. de Lux. Rom. c. 1. Pitific. L. Ant. T. 2. p. 85.

The other form of a journal, which Mr. Malcolm judges preferable in certain respects to the former, makes the journal a compleat transcript of the waste-book, without any alteration, leaving on the left side of every page a large margin, about a third part of the page; on which against every transaction, is to be written the names of the debtors and creditors of that transaction, with their titles of debtor and creditor, and sums of money; observing, that where there are sundry debtors or creditors to one creditor or debtor, they write their names next each other, and the name of the one corresponding debtor or creditor against the total of the other sums; by which means the balance and connection appears at sight. Then, when the transaction is transferred to the ledger, they write on this margin the numbers of the folios where the accounts stand in the ledger; for the purposes already mentioned in speaking of the former method. This book may be called either the *waste-book*, or *journal*, being in reality both; not only as every *waste-book* is a *journal*, but as there is here also that which distinguishes both a *waste-book* and a *journal*.—*Malc. lib. cit. sect. 4. p. 30.* By an ordinance of the year 1673, all traders in France, whether by wholesale or retail, are obliged to keep a journal, containing all their affairs, debts active and passive, bills of exchange, &c. For want of keeping this, and surrendering it up on a failure, they are to be reputed fraudulent bankrupts, and subjected to the penalties thereof.—*Vide Savar. D. Comm. T. 2. p. 570. seq.*

Ledger, or *Ledger-Books*, sometimes also called the *great-book*.

Merchants Books are divided into *essential* and *auxiliary*.—*Essential*, or *necessary*, are those without which regular accounts cannot be kept; in which number some include the *journal*, *waste-book*, and *ledger*; others only the two latter.—*Th. Malc. Treat. of Book-keep. c. 1. Sect. 2. p. 3.*

Subsidiary, or auxiliary, are separate books, wherein particular accounts are kept more distinctly, for easing the ledger,—Such are the cash-book, debt-book, book of expences, &c.

Wage-Book, the first, and most essential: in this, all kinds of matters are, as it were, mixed and jumbled together; to be afterwards separated and transferred into the others: so that this may be called the elements of all the rest.—It may be kept two ways; the first by entering things down simply as they happen, *v. gr. Bought of such a one, sold to such a one, paid such a one, lent so much, &c.* the second by entering at once, each article, debtor and creditor: this last is esteemed the best; in regard, forming a kind of little journal, it saves the keeping any other.—*Vid. Savar. loc. cit. p. 570.*

The *waste-book*, Mr. Malcolm observes, is an universal and compleat memorial of all the transactions and events of business, taken in the natural order of time; whereby all things of one date are placed together; serving as a preparation for the ledger-book, into which they are all to be transferred, upon distinct accounts, according to the order of subjects.

The *waste-book* begins with the inventory of a merchant's effects, and debts; and contains a compleat record of every transaction of his affairs, with all the circumstances, in a plain narration of matter of fact; every transaction following another in the order of the dates.

This *book* is in reality a journal, or day-book; but that name being applied to another, the name *wagfe-book* is given to this by way of distinction: though what relation the word *wagfe* bears to the nature of this *book*, is not very obvious.—Some authors better call it the *memorial-book*, or *memorandum-book*, in regard its principal use for taking memorandums.—*Vid.* *Malc. lib. cit.* c. 1 *sect.* 2. p. 4. *segg.*

Journal-Book, or *day-Book*, is that wherein the affairs of each day are entered orderly down, as they happen, from the waste-book.—Each article in this book is to consist of seven parts, *viz.* the date, debtor, creditor, sum, quantity and quality, how payable, and the price.

The journal, so far as it differs from the *waste-book*, is only a *book* of aid to the ledger.—There are two different methods of keeping it: in the first, which is that hitherto chiefly in use, the journal is a complete transcript of the *waste-book*, in the same order of time, but in a different file: for that the *waste-book* expresses every transaction in a simple narration of what is done; whereas the *journal* distinguishes the debtors and creditors, as a preparation for the ledger: thus, when any transaction is to be transferred from the *waste-book* into the *journal*, they examine it by the rules of the ledger, as if it were to be entered immediately there; and finding the debtors and creditors to which it belongs, these are distinctly marked by their denominations of *debtor* and *creditor*, in the file of the journal; at least, the accounts that are debtors are expressly so named; and by their being directly connected debtor to some other accounts, these are sufficiently determined to be the creditors, though the word *creditor* be not written.

The management of the ledger being of great importance in accounts, we will subjoin, from Mr. Malcolm, the following rules relating thereto. 1^o That

For every distinct subject, with which you have an account *i. e.* for every person with whom you deal on mutual trust and credit, or who, by any means becomes your debtor, or you his) as well as for every thing you deal in; there must be a certain separate, space, or portion allowed; wherein are to be written all and only the transactions relating to that subject, whose name is to be inscribed, or written on the head thereof; making thereby distinct particular accounts.

2^o. Every account is to be distinguished into two parts, taking for each an equal portion (less or more, as you think fit) of right and left pages, of one folio or opening; the name of the subject being written on the head of the account, on both sides, which are distinguished by the words *debtor* on the left side, and *creditor* on the right, for the uses following: to which the columns explained below are subservient.

3^o. Every personal account to contain, on the debtor side, all the articles which that person owes you, and the payments you make of your debts to him: and on the creditor side all that you owe to him, and the payments he makes of his debts to you. Or, because this rule considers payments under the notion of mutual opposite debts upon the receiver, if this be once supposed, the rule may be briefly expressed thus: Every person is debtor for what he owes me, and creditor for what I owe him.

4^o. Every real account ought to contain, on the debtor side, the quantity and value of what was upon hand at the beginning of the account, and what was afterwards received, with all cost and charges: and, on the creditor side, the quantity and value of what is disposed of, or any way taken away, or gone out of it, with all the returns that subject makes me. Or, more briefly thus: it is debtor for all received, first cost and charges; and creditor for all gone out of it, with the returns.

5^o. Every transaction must be entered in the *ledger-book*, with a balance of debt and credit, *i. e.* so as that every article be placed on the debtor side of one account, and the creditor side of some other, making thereby equal debt and credit in the ledger; and where the personal and real accounts concerned in the transaction do not, in the articles belonging to them, make this balance (as they will in most cases) then some imaginary account must be used to supply the defect.

6^o. Those accounts, whose articles of debt and credit, in any transaction, balance one another, are, in the ledger, to be connected together in the file of every article, as mutual and correspondent debtors and creditors; by writing in each of the corresponding accounts the name of the other, after the particle *to* in the debtor's account, and *by* in the creditor's, which connects the two; the name of the account, in which the articles are written, with its quality of debtor and creditor, being understood as joined to, and so is read before, the word *to* or *by* in every article, (though it be written only once for all upon the head of the account.) Then, after the name of the corresponding creditor or debtor, follows a brief narration of the fact; the date and other numbers being placed in their proper columns.—Hence we find the use of the column that stands within the money-columns, which is this, to write in it the number of the folio where stands the corresponding account, with which the account in which you write is connected in every article.—*V. Malc. Treat. of Book-keep. c. 1. sect. 3. p. 7.—20.*

To facilitate the use of the ledger, there is an alphabet, to serve as an index or repository; consisting of 24 leaves, each cut on the edge, and marked with one of the 24 letters; wherein, the initial letters of the persons names with whom you have accounts, are inserted, with the folio of the ledger, where the account is stated.—*V. Savar. lib. cit. p. 571.*

The more exact book-keepers extend the index to the things or commodities a man has dealings in, as well as the persons he deals with. Generally, it is the letter of a man's surname, and the proper name of the thing that directs its place in the index: thus John Gordon is put under G; and claret wine under C, unless all sorts of wines be comprehended in one account, in which case it is put under W.—*V. Malc. ubi supra sect. 4. p. 27, seq.*

Debt-Book, or Book of Payments, a book wherein is entered the date whereon all sums fall due, whether to be paid, or received by bills of exchange, merchandizes, or otherwise: to the end, that by comparing receipts and payments, provision may be made in time for a fund for payment; by receiving bills, &c. due, or taking other precautions.

Two models will suffice for the use and form of this book: it is only to be observed, that like the ledger, it must be on two opposite pages; moneys to be received on the left hand, those to be paid on the right.

The *Cash Book* is the most important of all the auxiliary ones: it is so called, because it contains, in debtor and creditor, all the cash that comes in or goes out of the merchant's stock.—In this are entered all the sums received and paid daily; those received on the left hand, with the person's name, of whom received, for what, for whom, and in what species: those paid on the side of creditor; mentioning likewise, the species, the reason why, the person to whom, and for whom the payment is made.—For instance;

Better to conceive the nature of this book, it is to be observed, that in business where cash happens to be an account which has numerous articles, it is convenient to keep a particular account thereof, in a book distinct from the ledger; and for this reason called the *cash-book*. This is formed in all respects, like the cash-account in the ledger, with a debtor and creditor side; in which all the cash received and given out is entered; either in a simple file, or in that of the ledger: but which way soever the narration is made, every article must be duly entered on the opposite side of the corresponding account in the ledger; with a reference to the ledger account of cash: for such an account there must also be, into which the sums of the debtor and creditor sides of the particular account must be transferred once a week or month, as is found convenient; thus, in the cash-book, the sums being written down against them, write transfers! to the ledger, and mark the folio; and in the ledger account, enter the sum with the date of the transfer, debtor *to*, and creditor by sundry accounts, as *per* the cash-book. The cash account in the ledger is necessary for the balance of the whole; and the convenience of the separate account of all the particulars, is, that we have them all together, in one continued account: whereas, the rule of the ledger being not to allow more than one folio for one account, till that be filled up, the account might hereby lie in several different folios.—*V. Savar. l. c. p. 571, seq. Malc. c. 2. sect. 2. p. 54.*

Book of Invoices, a book to save the journal from the erasures inevitable in taking abstracts or invoices of the several goods received, sent, or sold; where it is necessary to be very particular, and to render those invoices easier to find than they can be in the waste-book. The invoices here entered are to be those of goods bought, and set to account of some other; those of goods sold by commission; of goods sent away to be sold on our account; and those of goods sold in partnership, whereof we have the direction, or whereof others have the direction.—*V. Savar. p. 575.*

This book contains an account or invoice of all the goods which a person ships off, either for his own account, or for others in commission, according to the bills of lading; with the whole charges till on board; every invoice following after another, in order as they happen.

The invoice book is only a copy of what is written in the waste book, in those cases.—After the date, the narration is to begin thus:—Shipped aboard the ship—A.B. master; bound for—the following goods; consigned to—for my account, or by order, and the account of.—Or, it may be begun thus,—Invoice of goods shipped aboard—&c.

The design of this book is for the more ready finding out these invoices, than can be done in the waste-book.—*V. Malc. ubi supra, c. 2. sect. 3. p. 62.*

Factor-Book is an account of what a person receives to sell in commission for others, and of the disposal thereof.—It is numbered and distinguished into folios, like the ledger; on the left hand side is written, in a plain narrative file, an account of the goods received, with all charges: and on the opposite

1000

side,

side, an account of all the sales, and disposals of those goods.—So that this is only a copy of the employer's account of goods in the ledger, in the file of the waste-book. Where a person does little in commission, a separate book for this purpose is needless.—*V. Malc. loc. cit. p. 63. Savar. p. 575.*

Book of Accounts Current is kept in debtor and creditor, like the ledger; and serves for accounts sent to correspondents; to be regulated in concert with them, ere they are entered in the ledger. This is properly a duplicate of the accounts current, kept to have recourse to on occasion.

Book of Acceptances is destined for the registering all bills of exchange, notified by letters of advice from correspondents; to be able to know, on the bills being presented, whether they have orders to accept them or not.—When they chuse to decline accepting a bill, against the article thereof in the book they put *P. i. e.* protest; that, on offering the bill, the bearer may be told he may protest it: on the contrary, if they accept it, they write against it an *A*; adding the date, or day of acceptance. And this, upon being transferred to the debt-book, is cancelled.

Book of Remittances serves to register bills of exchange, or they are remitted by correspondents, to require the payment thereof.—If they be protested for want of acceptance, and returned to those who remitted them; mention is made thereof against each article, by adding a *P* in the margin, and the date of the day when they were returned; then cancelled. The books of acceptances and remittances have to near a relation to each other, that many merchants, &c. make but one of the two, which they keep in debtor and creditor; putting acceptances on the side of debt, and remittances on that of credit.

Book of Expenses, a detail of the petty expenses, both domestic and mercantile; which at the end of each month are summed up, and make an article for the cash-book.—*V. Savar. p. 577.*

This book, being a separate account of all the expenses of living, serves to keep both the profit and loss account, and also the cash-book, more distinct: the greater and more considerable articles are to be placed here particularly; but the several small articles, of daily disbursements, only in totals: though under what denominations, and how general or particular the articles of this book are to be made, must be left to every one's choice. All necessary to observe here, is, that the cash paid out on such accounts must be carefully entered here, and thence once a week or month, be transferred to the cash-book, and to the profit and loss account in the ledger; which is debtor to cash for it.—*Vid. Malc. loc. cit. p. 54.*

Book of Numeros or **Wares** is kept for the easy knowledge of all the goods brought in, sent out, or remaining in a warehouse.—On the left-hand page are entered the quantity, quality, and number or mark of the goods brought in; on the right, the discharge of the goods out of the warehouse, against the respective articles of the first. Thus,

N ^o 1	A bale of white pepper—weighing	400 l.
2	A piece of crimson damask.—ells	63

March 1	Sold to Charles Mitchell.
Apr. 10	Sent to Nichols of Bristol.

Month-Book is numbered in folios like the ledger, and divided into spaces, on the top of each of which are the names of the 12 months of the year; January, February, &c. allowing a whole folio, or what you please, to each month; and a different set of 12 spaces for every different year.—On the left-hand page enter the payments to be made to you, in that month; and on the right-hand page the payments you are to make. Make a column likewise on the left-hand of every page; in which, write the day of payment; and after this, the name of the debtor or creditor; and draw the sum into the money-columns.—*Vid. Malc. p. 64.*

Book of vessels is kept in debtor and creditor; a particular account being kept for each vessel. To the side of debtor, are put victualling, fitting out, wages, &c. To the side of creditor, are put every thing the vessel has produced; whether by way of freight or otherwise. Lastly, the total of each is entered in the journal, upon balancing the account of each vessel.

Book of Workmen is particularly in use among manufacturers, who have considerable works in their hands. It is kept in form of debtor and creditor for each workman employed. On the side of debt is put the matters given them to work; and on that of credit, the work they return.

Book of Cargo, or **Loading**, *livre de bord*, is kept by a clerk of a ship; wherein are entered all the goods aboard the vessel, whether those only for freight, or for sale, or exchange; the whole according to the specification in the master's bills of loading.—*V. Savar. D. Comm. Suppl. p. 965.*

Bank-Book. In cities, where there are public banks, as at Venice, Amsterdam, Hamburg, and London, a book is necessary wherein to keep an account of the sums paid to, or received from the bank.

Book, absolutely used, denotes the waste book, sometimes the journal or day-book.

In this sense it is they say, I have put down such a sum in my book: you shall have an extract of my book, &c.—*V. Savar. D. Comm. T. 1. p. 569. voc. LIVRE.*

Book of Rates is a book established in parliament, shewing at what value goods which pay poundage are to be reckoned at the custom-house.—*Vid. D. Ruft. T. 1. in voc.* See also **CUSTOM, DUTY, TONNAGE, and POUNDAGE.**

The book of rates annexed to the act of tonnage and poundage made in the 12th year of king Charles II. is subscribed with the hand of Sir Harbottle Grimstone, then speaker of the house of commons.—An additional book of rates of goods and merchandizes usually imported, and not particularly rated in the former, with rules, orders, &c. is signed by Spencer Compton, Esq; speaker of the house of commons, 11 G. 1. c. 7.

BOOK-BINDING, the art of sewing together the sheets of a book, and covering them with a back, &c.

Binding is distinguished from stitching, as in the latter, the leaves are only sewed, without bands, or backs.

We say, French-binding, law binding, marble-binding, binding in leather, in wood, in parchment, in sheep, in calf, &c.

Dutch-binding is, where the backs are of velom.—The Italians are still contented to bind in a coarse, thick paper, called *binding alla Rustica*, the inconvenience of which is its being liable to wear out without careful use.—*V. Barth. de Lib. Legend. diff. 4. p. 99.*

No doubt, but the art of binding is almost as ancient as the science of composing books; and that both the one and the other followed immediately the first invention of letters. Whatever the matter were wherein men first wrote, there was a necessity of uniting the several parts together; as well for the making them of one piece, as for the better preserving them: hence the origin of book-binding; for which, in all appearance, we are indebted to the Egyptians, that learned people, among whom the arts and sciences began to flourish so early.

According to Olympiodorus (apud Phot.) it was one Philatus, a learned man at Athens, who first taught the use of a kind of glue, to fasten the several leaves together: on which account a statue was erected to him.

The manner of binding books in *Volumes*, i. e. of gluing the leaves together, to roll them on round pieces or cylinders of wood, appears the most ancient; though that of binding them square, and of sewing several quires one over another, lays claim to good antiquity. The first of the two, which we call *Egyptian-binding*, held a long time after the age of Augustus; but it is now diffused, excepting in the Jewish synagogues, where they continue to write the books of the law on velom sewed together; making, as it were, only one long page, with two rollers, and their clasps of gold or silver at each extremity.—*V. Reimman. Idea Antiq. Liter. p. 243.*

The form now in use is the square binding, which is said to have been invented by one of the Attali, kings of Pergamus; to whom we likewise owe the manner of preparing parchment; called in Latin, from the name of his capital, *Pergamena*, or *Charta Pergamea*.

Manner of binding Books. The first operation is to fold the sheets according to the form, viz. into two for folio's, four for quarto's, eight for octavo's, &c. which they do with a slip of ivory or box, called a *folding-stick*: in this the workman is directed by the catch-words and signatures at the bottom of the pages. The leaves thus folded, and laid over each other in the order of the signatures, are beaten on a stone with a hammer, to make them smooth and open well, and then pressed. Being thus prepared, they are sewed in a sewing-press upon pack-threads or cords, which are called *bands*, at a proper distance from each other, and in a convenient number; which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first, and proceeding to the last. The common number of bands are six in folio's, and five in quarto's, octavo's, &c. After this the books are glued, the ends of the bands being opened, and scraped with a knife, for the more convenient fixing the paste-boards; then the back is turned with a hammer, the book being fixed in a press between boards, called *backing-boards*; in order to make a groove for fixing the paste-boards. The boards being applied, holes are made for fixing the boards to the book; which operation is called *drawing in*. Then the book is pressed, in order for cutting; which is performed by a machine called a *plough*, to which is fixed a knife. After this the book is put into a press called a *cutting-press*, betwixt two boards, the one lying even with the press, for the knife to run upon, the other above it for the knife to cut against.

The book being cut, the paste-boards are squared with a pair of iron-shears; it being then ready for sprinkling, gilding, blacking, or marbling the leaves. The colours with which it is sprinkled, are usually vermilion and sap-green; which is done by a brush made with hog's bristles, holding the brush in one hand, and moving the hair with the other.

In the French-binding, a book is put in parchment; i. e. a slip

slip of parchment, the length of the book, is applied on the inside of each paste-board; so, however, as that being cut or indented in the places against the bands, it comes out between the edge of the paste-board and the leaves of the book to cover the back: this preparation, called *indorsing*, seems peculiar to the French binders; who are enjoined by ordinance to back their books with parchment, on the penalty of 30 livres, and the re-binding of the book: it is done in the press, where the back being grated with an iron instrument with teeth, to make the paste take hold, wherewith the parchment is first fattened; they afterwards add strong glue to fortify it.

Manner of gilding books on the edges.—The book being put in the press, between two boards, is scraped with a knife called a *scraper*; and after that with another called a *smoother*, in order to take out all scratches. Being thus prepared, they scrape a little yellow oker upon the book, then wet it with a little size-water, and rub it off with some clean shavings. The gilding-size is made with the white of an egg, mix'd with water, and beat well together. The leaves being wetted with the size-water with a brush, the gold is then laid upon it, and afterwards dried before the fire. When dried, it is burnished off with a dog's-tooth set in a handle. Blacking the leaves is done with fine antimony, the leaves being wet, and the antimony, rubbed upon them, and burnished off when dry.

On the gold thus applied, they anciently made ornaments, with hot irons of various forms and devices; the practice of which seemed to have been retrieved in France about the beginning of the eighteenth century, and carried to a good perfection by the abbot de Seuil, and others; and called by a new invented name, *antiquing*: but as the modern taste seems rather inclined to simplicity, it is probable these antiquo-modern ornaments will be dropped again.

The headband is now added; which is an ornament of silk of several colours, or even, sometimes, of gold or silver, placed at each extreme of the back, across the leaves; and wove or twisted, sometimes about a fingle, and sometimes a double piece of rolled paper.

For the covers; though the skins used herein, undergo several preparations in the hands of other workmen; yet there are some still left for the book-binder, and peculiar to his art: these we shall explain, in calf, as being the leather most used; and, as being that to which all the rest, with a little variation, may be referred.—The calf-skin being then moisten'd in water, is cut out to the size of the book with a knife. It may be easily imagined, that none of these preparations, except the last, are used in velvet, &c. wherewith books are sometimes cover'd; in regard the water would spoil them.

The cover is next smeared over with paste made of wheat-flour; then stretched over the paste-board on the out-side, and doubled over the edges within-side: after having first taken off the four angles, and indented and plaited it at the head-bands.—They then cord the book, or bind it firmly between two boards with a kind of whip-cord, to make the cover stick the stronger to the paste-boards and the back; as also to form the bands or nerves the more accurately: in this operation the workman arms his hand with leather, to enable him to pinch it the harder; and uses a pair of pinchers to bring the thread nearer each band.

The book is now set to dry; and when dry, uncorded, and the leaves at each end opened, the book is washed over with a little paste and water, the edges and squares blacked with ink, and then sprinkled fine with a brush, by striking it either against the hand or a stick, or with larger spots mix'd with vitriol, which is called *marbling*.

The cover is now glazed twice with the white of an egg beaten; and at last polished with a polishing-iron, passed hot over the glazed cover.

If the book be required to be lettered, they paste a piece of red morocco on the back, between the first and second band, to receive the title in gold letters; and sometimes a second between the next bands underneath, to receive the number of the volume.

The binding, properly so called, is now complete; and there remains nothing but the gilding work on the back and cover; which, as it makes a part of the book-binder's business among us, (though with the French, &c. it is a distinct profession) we shall here subjoin.

Manner of gilding books on the backs and covers.—In ordinary binding, they gild little else but the backs, and the outward edges of the cover. On the backs are gilt the title of the book, &c. with flowers, roses, knots, stars, &c. between the bands: on the covers are sometimes added compartments, arms, &c. All these ornaments are made with each its several gilding-tool, engraven in relief; either on the points of punchions, as those of letters, roses, stars, &c. or around little cylinders of brass, as the lines, embroideries, &c. The punchions make their impression by being pressed flat down; and the cylinders by being rolled along by an iron ruler, by means of a double branch; in the middle whereof, they are fitted on an iron stay, or axis, that passes the middle of their diameters.

To apply the gold, they glaze those parts of the leather,

whereon the tools are to be applied, lightly over with a pencil or sponge; and, when half dry, lay over them pieces of leaf-gold cut out near the size; and on these stamp the punchions, or roll the cylinders, both the one and the other reasonably hot. If the figures be large, and require a great relieve, as arms, &c. they are beat down with a mallet or hammer.—The gilding thus finished, they rub off the superfluous gold with a hare's foot; leaving nothing covered with gold, but the places whereon the hot tools had left their impressions.—V. Savar. T. 2. p. 1373—1377. *Voc. RE-LIEURE.*

Ahas. Fritsch, chancellor of the university of Jena, has a dissertation express concerning book-binders, *de Libriopegis*; wherein he treats of the laws prescribed these artificers, and the tax or price settled by the magistrate for binding books of every sort in sheep-skin, velvet, &c.—The rates fixed for binding in sheep, throughout the electorate of Saxony, are, for large folios, 1 gulder or florin, 3 groffes; common folio, 1 florin; large quarto, 12 groffes; common quarto, 8 groffes; large octavo, 5 groffes; common octavo, 4 groffes; duodecimo, 3 groffes; sedecimo, 2 groffes.—V. Fritsch. *Traité de Typogr. Bibliopol. Chartar. & Bibliopg. diff. 4. §. 3.*

BOOK-KEEPING, the art of keeping accounts; that is, of recording the transactions of one's affairs in such a manner, that the true state of any part, or of the whole, may be thereby known with the greatest clearness, exactness, and ease.—V. Malc. *Treat. of Book-keep. c. 1. sec. 1. p. 1.* See also the article ACCOUNTS.

By the *transactions of one's affairs* are meant, either such as relate to the persons with whom we deal, or the things in which we deal; which last are either money, the principal means of commerce, or goods, comprehending all other effects.

By *knowing the true state of one's affairs* is meant, to know what relates to every person we deal with, and every thing we deal in; that is, what every person owes me, or I owe him; and what quantity and value of every kind of effect is in my hand, with the gain and loss on that subject within the time of the account.

The art of book-keeping is comprized in the use of several books of accounts, which are partly essential, and partly subsidiary. See the article BOOKS.

Books are either kept *single*, as among retail dealers; or *double*, as among great merchants: for the first, a *journal*, or *day-book*, and a *ledger*, or *post-book*, are sufficient; for the second, there are several others required.

All authors agree, that it was the Italians, particularly those of Venice, Genoa, and Florence, who first introduced the method of *keeping books double*, or in two parts; hence, among us, it is called *The Italian method*.

In this, there are three books, generally held indispensably necessary; viz. the *waste-book*, *journal*, and *ledger*: besides, there are others, to the number of thirteen, or more, called *subsistent* or *auxiliary books*, used as occasion requires; viz. the *cash-book*, *debt-book*, *book of numbers*, of *accounts-currant*, of *commissions*, orders or *advices*, of *acceptances*, of *remittances*, of *expenses*, of *copies of letters*, of *vouchers*, and of *workmen*.

These books are kept the same, as to substance, in most trading cities in Europe; but not as to coin: each being regulated by that sort of coin which has course in the state where they are.

In England, books are kept in *pounds*, *shillings*, and *pence*; in France, in *livres*, *sols*, and *deniers*; in Holland, in *florins*, *patars*, and *penings*; at Dantzic, in *rixdollars*; through most parts of Germany, in *florins*, *crutzers*, and *penings*; at Hambourg, in *marks*, *sols*, and *deniers lubi*; at Lisbon, in *rees*; at Florence, in *gold crowns*, *sols*, and *deniers*; in Spain, in *maravedis*; sometimes in *rials* or *pieces of eight*; at Messina, and through Sicily, in *ouners*, *taris*, *grains*, and *piccolis*; at Venice, in *ducats*; in Muscovy, in *rupees*, *altins*, and *grives*: through all the states of the Grand Signior, in *piasters* and *aspers*.—V. Savar. *D. Comm. T. 2. p. 578. seq. voc. LIVRE.*

Book-keeping, though chiefly in use among merchants and great dealers, is yet applicable with advantage to persons of all other conditions; as retailers, stewards, gentlemen of land-estates, &c. with this only difference, that the narrower their affairs and transactions are, the fewer books they need to keep, and *vice versa*. The same ways of accounting, which in great and diffused trade prevent confusion, by an artful and regular disposing of things, if applied to mean and narrow dealings, will create confusion, at least will give more ado than needs; since a few things shew themselves readily, and are examined by mere inspection: supposing no other method but a waste-book record; every corner whereof, in very small dealings, the owner's eye is acquainted with, so that he can readily turn to what he wants: but this, in larger accounts is impossible, which makes order, the strictest form, and much writing absolutely necessary.—Yet this one rule must be indispensibly observed in all cases, viz. That a true and exact memorial of every thing belonging to the account he made, just as things occur;

and if business encrease, so that a nearer approach to the perfection of accounting be necessary, this will serve as a ground-work, on which you may raise the account to what form you please.—But the least a man can do, will be some part of the method explained under the article Books. Of which all methods whatever are a part; as comprehending the greatest simplicity in the waste-book, and art in the ledger.

For a person in a single state, who has no business, but the receiving at certain times in the year a sum of money, which he lays out again for his private and personal expenses, a pocket-book is sufficient.

For one in a married state, whose fortune consists also of money, as he has a greater variety of expenses, he must be careful to keep an exact account of what cash he receives and pays: and, to make this account more distinct and orderly, it will be best to keep the particulars of the payments in a separate book, and, to bring them into a cash-book once a week, in totals, digested under such denominations as he thinks fit, as *bread, beer, fish, coals, candles, &c.*—Things thus brought into the cash-account, may be again drawn into an abstract, shewing the total of each kind of expenses for every month, by dividing a page into twelve columns, with the names of the twelve months; and then in so many articles on the margin setting the names of the several heads of expenses, and against each, under the respective month, the sum of that kind of expenses in that month; then will the sum of the money in the columns under each month be the total expense of that month, and the aggregate of these sums the year's expenses.—For artificers, handicrafts men, and the like, they may keep accounts of the expenses of living, as above; but it will also be necessary to make a distinct account of the charges and profit of their business, which may easily be done, by an exact account of all they pay or owe for the materials and instruments of their work, with servants wages, and taxes upon their trade; and of all they receive or is due for their work. They may conveniently keep accounts for the materials of their work, to satisfy them of the disposal thereof, and serve as a check on servants who have access to those things, and they must keep accounts for the persons they deal with, both in buying and selling.—For petty traders, who deal in some hundreds of trifling wares, and make sales to the value of a farthing or halfpenny, these cannot pretend to keep orderly accounts; the best they can do is, to be careful that servants do not wrong them; for they have no account of goods; and if you ask what of any kind remains with them, they must go look, if their memory fail.—These can only have a cash-account, which they are to charge once a week with the money received, and discharge for what they give out; it is not convenient that they should touch the cash-box or till, oftner than once a week, when it is completed; but if they do, they must keep a separate account of what they take out, to know what was received. Besides which, they should have a kind of ledger for the persons with whom they deal upon credit, in which they give every debtor or creditor an account, with a debt and credit both on one side, either with a double money column, or constant deductions, as the debts and credits succeed one another.—They may also, for the sake of those, have a memorandum, or day-book, wherein all things of this nature are writ down, and then carried into the other.

For more considerable shop-keepers, who commonly deal in only a few different species of goods, as drapers, mercers, &c. they usually keep a ledger for persons and wares distinct, without any formal connection or reference of the accounts, in their several articles; whereby there can no regular balance be made. In the accounts of persons, they use the formality of a debtor and creditor stile, which is mere show, without the real value of a regular account; there being no opposite corresponding debtors and creditors to be found. For their ledger of wares, as they call it, contains nothing of this; and is but an imperfect contrivance, which they satisfy themselves with, to know how much remains. But the worst is, that in allotting spaces for the accounts of wares, they frequently allow no more than they suppose may serve for the retail of the quantity first entered on that space; and when this is disposed of, take a new space for a new parcel; which in a quick trade is not only troublesome but confused, if there be any of the old parcels remaining; unless they carry it to the new account. In reality, dealers in retail, if considerable in their way, ought not to come short of the utmost pitch of art: at least, they should keep three grand books, a *waste, journal, and ledger*; unless they shall think fit to join the first two into one. The *waste-book* to contain every thing done in the shop, both what is sold on trust, and for cash.—This and the *journal* may be made in one, by marking the debtors and creditors on the margin, against every transaction of value.—For the *ledger-book*, because there are commonly many articles of debt to one of credit, on men's accounts with whom they deal, and many articles of credit for one of debt, upon account of wares, they may keep the debt and credit both on one side, by double money columns;

in the one of which let the debt, and in the other the credit be set.

For gentlemen of landed estates, the books necessary to be kept are, 1^o. A great *waste-book*, containing a plain narrative of all things as they occur; as receipts, and payments; every thing given and received; and, in short, whatever is done relating to any thing or person they are concerned with: out of which are to be made up, 2^o. A *cash-book*, containing in a plain narrative file, upon the debtor-side, all receipts of money; and upon the creditor-side, all payments: and though there be several articles received or paid together, belonging to the same account, which are entered particularly in the waste, yet they may be set down here in a total sum: for example, there is paid 26 l. for divers pieces of household furniture, all particularly mentioned in the *waste-book*, yet in the *cash-book* there needs no more than to say, paid for household furniture, &c. 3^o. A book of accounts with tenants, where, in distinct places, every one's charge and discharge may be fairly written, without any great formality of file; and if it have a show of debtor and creditor side, it will be the more distinct. 4^o. A book of petty accounts with servants and workmen, &c. 5^o. A book of real accounts; containing an account of cattle, corn, and other stock or furniture, to know at all times what you have, and how it is disposed of.—If a gentleman advance no nearer to the artificial part of accounting, he must keep an account with every person, with whom he has dealings; which may be done in the same book with his tenants' accounts; only allotting distinct parts for them; the last will take no great room compared with the other: these books of accounts must have indexes.

For factors or stewards on land-estates, a general *waste-book* will be necessary, to contain all matters transacted, relating to their master's concerns, under their management. Out of which let them make a *cash-book*, in the manner above directed; also a book of real accounts, that they may know what real effects, besides money, they have the charge of, and how it is disposed of; particularly the corn-rents, which have been delivered by the tenants, and put in the granaries under their charge, to be disposed and given out according to order.—*Vid. Malc. Treat. of Book-keeping. app. p. 7. —30.*

BOOK-SELLER, a professed trader in books; whether he print them himself, or procure them to be printed by others, for sale.

Book-sellers, among us, are the same with *bibliopoles* among the ancients, whose office was distinct from that of *librarii*. Petty dealers, or vendors of small wares, like our publishers, were more particularly denominated *libelliones*; whence Statius,—*de capsa miseri libellionis*.—*Vid. Stat. Sylv. l. 4. Carm. g. v. 21. Fabr. Thef. p. 1395.*

Authors frequently complain of the arts of *booksellers*: lord Shaftesbury gives the process of a literary controversy blown up by *booksellers*. The publication of books depends much on the taste and disposition of *booksellers*: among the German writers we find perpetual complaints of the difficulty of procuring *booksellers*; many are forced to travel to the book-fairs at Frankfurt, or Leipzig, to find *booksellers* to undertake the impression of their works: at Rome, the Argiletum was the mart of books, as Paul's Church-yard, or Fleetstreet, have been among us: whence that of Martial,

Argiletanus maris habitare tabernas,

Cum tibi, parve liber, scripta nostra vacent.

Vid. Schoettg. diff. de librar. & bibliop. Saleng. mem. de liter. T. 1. p. 174. Charact. T. 3. p. 10. Jeqq. Item p. 15. Jeqq. Item p. 27. Vid. Martial. Epig. l. 1. ep. 4. v. 1.

The fairs of Frankfurt and Leipzig are famous for the resort of *booksellers*, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the name of some celebrated *bookseller* of former times; *effigina Elzeviriana, Frobeniana, Morelliana, Tanfoniiana, &c.* A like conceit has taken some London *booksellers*, to inscribe over their door, *bibliopolium*, as if people could not know a shop to be a *bookseller's* without a Latin name. Even stall-men dignify their stands with *bibliopolium*; and Moorfields may probably, ere long, be surrounded with *bibliopolia*.

Formerly, the offices of *booksellers* and printers were united in the same persons. Labbe gives a list of learned *booksellers*; most of whom were also authors.—Of late days, *booksellers* have drawn their business into less compass, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministering to the republic of letters not with the head, or the hand, but the purse only. In which respect, not to mention some of our own *booksellers*, the Vander Aa's at Leyden, Gleditsch's and Fritsch's at Leipzig, Mortier's and Wetstein's at Amsterdam, and Halma's at Utrecht, though much below the Stephens's, Aldus's, Vascosans, Frobenius's, and Morels, have nevertheless acquired a just fame.—*Vid. Struv. Introd. in notis. Rei Literar. c. 11. §. 15. p. 930. Thurman. Bibl. Acad. p. 56. Jeqq. Labbe Biblioth. Biblioth. p. 233. Struv. lib. cit. §. 38. p. 953.*

The

The chief science of *bookfellers*, is the *βιβλιοποιεῖα*, or knowledge of books; we mean of the titles, different editions, prices and scarcity of them, without regard to their contents, or qualities, otherwise than as these affect the sale of them.—*Vid.* Struv. *Introd. in notit. Rei Literar.* c. 1. §. 1. p. 1. *seq.* Lang. *Infl. Stud. Theol.* c. 1. memb. 2. p. 98. *seq.* See also the article *Book*.

An acquaintance with the *bookfellers* marks or signs, frequently expressed on the title-pages of their books, is of some use; by reason many books, especially in the last century, have no other designation either of printer, *bookfeller*, or even city.—The *anchor* is the mark of Raphaelengius at Leyden, and the same with a *dolphin* twisted round it, of the Manutii at Venice and Rome; the *Arion* denotes a book printed by Oporinus at Basil; the *caduceus*, or *pegasus*, by the Wechelii at Paris and Francfort; the *cranes*, by Cramoisy; the *compasses*, by Plantin at Antwerp; the *fountain*, by Vascosan at Paris; the *sphere* in a balance, by Janfon or Blaeuw, at Amsterdam; the *lily* by the Junta's at Venice, Florence, Lyons and Rome; the *mulberry tree*, by Morel at Paris; the *olive-tree*, by the Stephens's at Paris and Geneva, and the *Elzevirs* at Amsterdam and Leyden; the *bird between two serpents*, by the Frobenius's at Basil; the *truth*, by the Commelins at Heidelberg and Paris; the *Saturn*, by Colinaeus; the *printing press*, by Badius Ascensius, &c.—*Vid.* Baill. *Jugem. des sav. T. 1. P. 2. p. 91. seqq.*

Bookfellers are a kind of agents, or curators in the republic of letters: in many places, they are ranked among the members of universities, and entitled to the privileges of students: as at Tubingen, Salisburg, and Paris², where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid on other companies³.—*Vid.* Fritsch. *diff. de bibliop.* c. 7. §. 1. *seqq.* ²Savar. *D. comm. T. 2. p. 535. seq. vsc. Libraire.*

The traffic of books was anciently very inconsiderable; inasmuch that the book-merchants both in England, France, Spain, and other countries were distinguished by the appellation *stationers*, as having no shops, but only stands or stalls in the streets, where they exposed their wares to sale.—*Vid.* Du Cang. *Gloss. Lat. T. 4. p. 951. vsc. Stationarii.* During this state, the civil magistrate took little notice of the *bookfellers*; leaving the government of them wholly to the universities, to whom they were supposed more immediately retainers: who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion.—But when, by the invention of printing, books and *bookfellers* began to multiply; it became a matter of more consequence; and the sovereigns took the direction of them into their own hands; giving them new statutes, appointed officers to fix prices⁴, and grant licences, privileges⁵, &c.—*Vid.* Fritsch. *diff. de bibliop.* c. 4. ¹*Id. ibid.* c. 5. ²Thurman. *bibl. acad.* p. 10.

Chevillier shews, that the university of Paris had formerly the sole power of creating and appointing *bookfellers*, who were to take an oath to the university; and were reputed part of the academical body, and as such entitled to the exemptions of the other members thereof. They were to give security to the university for their behaviour, and produce attestations of their capacity for the discharge of their office: the university also deposed and expelled them at discretion: they were obliged to appear at all assemblies of the university, when summoned, and assist at the public processions thereof: they were obliged to lend their books to be read, or even copied by such as were disposed to borrow, on certain conditions, prescribed by the university. If they kept any books by them which were not correct, the university punished them: they were not allowed to buy any book of a student without leave of the rector: nor were they allowed to gain above four deniers in a livre, by any copies sold to the members of the university. Every *bookfeller* was obliged to have a catalogue of all his books hung up in the shop, with the prices, as rated by the university: no *bookfeller*, who had not taken the oaths to the university, might sell a book of above ten sols value.—*Vid.* Chevill. *diff. de l'orig. de l'imprim.* l. 4. *Jour. des Sav. T. 23. p. 240.* Savar. *D. Com. T. 2. p. 530. seq. vsc. Libraire.*

This state lasted from the thirteenth century till the invention of printing, and even till the end of the fifteenth century; during which time there were only allowed twenty-four *bookfellers*, two binders, two illuminers, and two sworn book-writers, or copists.—But from that time the kings of France began to take cognizance of them: Lewis XI. thought fit to prescribe some new regulations in 1467: under Francis I. the *bookfellers* were brought wholly under the royal authority, and received statutes from the king.—*Vid.* Savar. *lib. cit.* p. 531.

Ahas. Fritsch, chancellor of Jena, has a dissertation express concerning *bookfellers*, de *bibliopoli*, but it is a jejune piece, and besides, half-filled with passages in High Dutch untranslatable: what we find in it any way curious is some questions and cases, between *bookfellers* and authors, which he discusses on the principles of the Imperial and Saxon laws; as, whether any copy-money be due to an author, who has not been able to finish his book by reason of the difficulty of it?—whether a *book-*

feller, who printed the first edition, be entitled to the refusal of the second?—Whether new copy-money be due from the *bookfeller* to an author on a new edition of a book?—Whether a *bookfeller* may reprint a book without the knowledge and consent of the author?—Whether a number of copies be due to the author over and above the copy-money? which he resolves in the affirmative.—And whether a *bookfeller* may seize his books unpaid for, in a student's closet? which also he resolves in the affirmative².—See further concerning *bookfellers*, in the writers on Books and Printers.—More especially in Schoetgenius³, de la Caille⁴, Chevillier⁵, and others⁶, who have written expressly on the subject.—*Vid.* Fritsch. *tratt. de Typogr. & Bibliopoli*, &c. Jen. 1675. 4^o. *diff.* 2. c. 6. ²Crus. Schoetgenii *diff. de Librariis & Bibliopoli antiquorum*. Lips. 1710. 4^o. A notice of it is given in Keimm. *Idea syst. antiq. lit.* p. 60. ³Jean de la Caille, *Histoire de l'imprimerie & de la librairie, jusque au 1689*. Par. 1689. 4^o. An extract of which is given in *Journ. des Sav. T. 17. p. 467. seq.* ⁴And, Chevillier *l'Origine de l'imprimerie*. Par. 1695. 4^o. An extract of it is given in *Journ. des Sav. T. 23. p. 223. seqq.* Item p. 235. ⁵Fabric. *Bibl. Antiq.* c. 19. §. 7. p. 607. ⁶Thurm. *Bibl. Acad.* p. 10. Item p. 56.

BOOKING, among merchants; &c. the making an entry of any matter in the journal. See *BOOK*, *BOOK-KEEPING*, and *JOURNAL*.

BOOM, in the sea language, a long pole wherewith they spread out the clue of the studding-sail, sometimes also that of the main-sail and fore-sail, to make them broader, and receive more wind.

A ship is said to come *booming*, when she makes all the fall she can.

BOOM also denotes a pole with a bush or basket on the top, placed to direct ships how to steer into a channel; otherwise called a *beacon*.

BOOT, *Brodequin*, a kind of torture for criminals; to extort a confession, by means of a *boot*, flogging, or bulkin of parchment; which being put on the leg moist, and brought near the fire, in shrinking squeezes the leg violently, and occasions intolerable pain.

There is also another kind of *boot*; consisting of four thick strong boards bound round with cords: two of these are put between the criminal's legs, and the two others placed one on the outside of one leg, and the other on the other; then, squeezing the legs against the boards by the cords, the criminal's bones are severely pinched, or even broken, &c.

The *boot* is now disused in England; but it subsists still in some other countries, particularly Scotland.

BOOT-boying. See the article *HOUSING*.

BOOTES, in astronomy, a constellation of the northern hemisphere, whose stars, in Ptolemy's catalogue are 23; in Tycho's 28; in Bayer's 34; in Hevelius's 52; and in Mr. Flamsteed's catalogue 45. Their longitudes, latitudes, magnitudes, &c. are as follow:

Names and situations of the stars.	Longitud. Sign. ° ' "	Latitude. North. ° ' "	Magn.
10	51 56	28 11 26	6

BORAMET Z. See ZOOPHYTE.

BORAX, a mineral salt, chiefly used in foldinging, and fusing of metals; sometimes also in medicine, as an emetic and a promoter of delivery.

Borax is usually supposed to have been known to the ancients under the denomination *chrysocola*: though M. Geoffroy gives good reasons for believing the modern *borax* a different thing from the *chrysocola* of the ancients. *Vid. Mem. Acad. R. Scienc. an. 1732. p. 549.*

Pliny divides the ancient *borax* or *chrysocola* into *natural* and *artificial*: the *natural*, according to him, is only a slimy humour running in mines of gold, silver, copper, and even lead; which, being congealed and hardened by the winter's cold, becomes of the consistence of pumice-stone. *Plin. Hist. Nat. l. 33. c. 15.*

For the *artificial*, it is made by letting water run in the veins of the mine, all the winter long, till June; and letting the mine dry the rest of the year.—So that artificial *borax* is no more than the mineral purified and corrupted.

The same naturalist distinguishes it into *black*, *green*, *yellow*, and *white*; which assume their several colours, as well as values, from the different mines wherein they are formed. The moderns also distinguish two kinds of *borax*; *natural*, which is crude; and *artificial*, which is purified and refined. Crude, or natural *borax*, *borace non rifatto*, is a mineral salt, dug out of the earth in several parts of Persia; and found also at the bottom of a torrent, running in the mountains of Purbeth, near the frontiers of White Tartary: when taken up, it is exposed to the air; where it acquires a reddish fatness, which serves to feed it, and prevent its calcining. When in its perfection, it is sent to Amadabat, in the territories of the Great Mogol, where the European merchants buy it.

There is also another kind of natural *borax*, drier, and of a greenish colour, like English copperas; only differing from the former, by its being longer exposed to the air. For artificial or refined *borax*, *borace rifatto*, it was the Venetians who first found out the art of preparing it; or rather, of purifying the natural: it is said to be done by dissolving it in water; then filtering and crystallizing it; using, for that purpose, cotton matches; about which the *borax* crystallizes, like sugar-candy and verdigrease on wood.—The Dutch, after refining it, reduce it into little pieces, like tagged points; and it is thus commonly used.

Borax, refined, either in the Dutch or Venetian manner, should be clear and transparent, almost insipid to the taste; and above all, care must be taken it have no mixture of English alum.

Borax is of some further use in medicine, as it enters the composition of the *unguentum citrinum*. It is also used in the preparation of a focus for the ladies.

Agricola says, there is a fossil nitre, as hard as that whereof the Venetians make *borax*: in which he has reason; this nitre being nothing but the Persian *borax* above mentioned.

What he adds, that the Venetian *borax* is made of the urine of young people who drink wine, beat in a brazen mortar to the consistence of an unguent; then mixed with verdigrease and nitre: is not only false, but is a misrepresentation of a passage in Pliny, *Hist. Nat. l. 33. c. 5.*

M. Lemery the younger has made a great number of experiments on *borax*, by which it appears.—That *borax* unites with acids both mineral and vegetable; that it absorbs them, and together with them forms new salts of different kinds according to the species of acid employed.—That these acids incorporate themselves in the *borax* as they do in alcali salts.—In reality, the *borax* is itself a true native alcali, which does not need any art or decomposition to render it such, as the common alcali salts do.—That its action on acids is different from that of the common alcali salts, in that it is peace-

able and raises no commotion with them, &c. *Vid. Mem. Acad. R. Scienc. an. 1728. item an. 1729. p. 400. seqq. item an. 1732. p. 549.* See SUPPLEMENT, article BORAX.

BORDER, in heraldry. See the article BORDURE.

BORDERS, among florists, are such leaves as stand about the middle thrum of a flower. See FLOWER.

BORD-FREE. See the article FREE.

BORD-HALFPENY, or **BROD-HALFPENY**, money paid in markets, and fairs for setting up boards, tables, and stalls, for the sale of wares.

BORD-LANDS, the demesnes anciently kept by the lords in their hands, for the maintenance of their board or table.—This was also anciently called *bordage*.

BORD-SERVICE, called also *BORDAGE*, the tenure of lands, on condition of furnishing provision for the lord's board or table. *Spelm. Gloss. p. 85. voc. Bordarii.*

Some lands in the manor of Fulham, and else where, are still held of the bishop of London, by this service, that the tenants pay fixpence per acre in lieu of finding provision for their lord's table.

BORDURE, or **BORDER**, in heraldry, a kind of addition on the limb of a shield, in form of a hem, or girdle, encompassing it all round, and serving as a difference.—See *Tab. Herald. fig. 10*. See also the article DIFFERENCE. The *bordure* must be about one sixth part of the breadth of the shield.

Simple bordure is that which is of the same colour or metal throughout; and is the first addition of younger brothers.—There are others, *compounded*, *countered*, *ingrailed*, *indented*, and *charged* with other pieces; which make different additions for younger brothers, in several degrees.

If the line which constitutes the *bordure* be strait, and the *bordure* plain, as they call it in blazoning, the colour of the *bordure* alone is named: as, he beareth gules, a *bordure* or.—

If a *bordure* be charged with any parts of plants or flowers; they say, *verdoy* of treflois. If it consist of ermines, vair, or any of the furs, the term is, *purflew* of ermines: if the *bordure* be charged with martlets, the word is, *charged* with an enalour of martlets, &c.

BOREALIS Aurora. See AURORA Borealis.

BOREAS *, a Greek name, now in popular use, for the north wind.

* Etymologists usually derive the word either from the Greek *βῶρ*, *clamor*, noise; or from *βοῦς*, *ox*, food; because, forsooth, it creates an appetite, or because it is good for the fruits of the earth, which yield us food: others chuse to deduce it from the Hebrew *birjah*, food; or from *berri*, calmness; *ber*, purity; or *bar*, corn.—The ancients supposed *borax* only blew out of Thrace.

Pezron observes, that anciently, and with much greater propriety, *borax* signified the north-east wind, blowing at the time of the summer solstice: he adds, that the word comes from the Celtic *bor*, morning; in regard their principal light, in that season, came from that quarter, whence also the winds then usually blew.

BOREE, or **BORÉE**, a kind of dance, composed of three steps joined together by two motions; and begun with a crotchet, rising. The first couplet contains twice four measures, and the second twice eight. It consists of a balance-step and a couplet: it is supposed to come from Auvergne; others say from Biscay.

BOROUGH, **BURROUGH**, **BOROW**, or **BURGH**, is frequently used for a town, or corporation which is not a city. *Borough*, in its original Saxon *borgh*, or *bergh*, is by some supposed to have been primarily meant of a company consisting of ten families, who were bound and combined together as each others pledge. *Bracton l. 3. tr. 2. c. 19.*

Afterwards, as Verstegan has it, *borough* came to signify a town that had something of a wall or inclosure about it: so that all places which among our ancestors had the denomination *borough*, were one way or other fenced or fortified. But, in later times, the same appellation was also bestowed on several of the *villæ insigniores*, or country towns of more than ordinary note, though not walled.

BOROUGH or *burgh* is now particularly appropriated to such towns, and villages, as send burgesses or representatives to parliament.

Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English *boroughs* not incorporate: and, on the contrary, several corporations that are not *boroughs*; e. gr. Kingston, Deal, Kendal, &c. *Boroughs* are distinguished into those by *charter*, or *statute*; and those by *prescription*, or *custom*.

The number of *boroughs* in England is 149; some whereof send one, some two representatives.

Royal Boroughs, in Scotland, are corporations made for the advantage of trade, by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges.

These form a body of themselves, and send commissioners, each, to an annual convention at Edinburgh, to consult the benefit of trade, and the general interest of the *boroughs*.

BOROUGH-Englsh. denotes a customary descent of lands or tenements in certain places, whereby they come to the youngest, instead of the eldest son; or, if the owner have no issue, to the youngest, instead of the eldest brother: for that the youngest is supposed, in law, the least able to shift for himself.

BOROUGH-Head, or Head-Borough, is the chief man of the decenna, or hundred; chose by the rest to speak and act in their behalf.

In many parishes, *head-borough* also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See **CONSTABLE**.

BOSCAGE, denotes a place set with trees, a grove, or thicket.

In a *Law Sense*, **BOSCAGE**, *Boscagium*, signifies *mast*, or such sustenance as woods and trees yield to cattle.

Among *Painters*, **BOSCAGE** is said to denote a picture or landscape, representing much wood and trees.

BOSCO. See **ATTACHAMENTA de Bosco & Spinis**.

BOSPHORUS*, or **BOSPORUS**, in geography, a long and narrow sea, which it is supposed a bullock may swim over.

* The word is Greek, *Βοσπορος*, formed from *Βος*, *bos*, and *πορος*, *passage*.

The name *Bosphorus* is chiefly confined to two streights, in the Mediterranean sea, viz. the *Bosphorus of Thrace*, commonly called the *streights of Constantinople*, or *channel of the Black-sea*; and the *Cimmerian* or *Scythian Bosphorus*, so called, it seems, from its resemblance to the Thracian; now more commonly the *streights of Kapha*, or *Kiderleri*, from two cities standing on it.

The origin of the name is better agreed on, than the reason why it was first given to the Thracian *Bosphorus*: Nymphius tells us, on the authority of Accarion, that the Phrygians, desiring to pass the Thracian freight, built a vessel, on whose prow was the figure of a bullock; and which was hence called *bos*, *bullock*; and served them for a ferry-boat.—Dionysius, Val. Flaccus, Callimachus, Apollodorus, Marcellinus, &c. say, that to being transformed into a cow by Juno, passed this freight swimming, which hence was called *Bosphorus*.—Arrian tells us, that the Phrygians were enjoined by the oracle, to follow the rout which a bullock should mark out to them; and that upon stirring one up, it jumped into the sea to avoid their pursuit, and swam over this freight. Others say, that an ox, tormented by a gad-fly, threw itself in and swam over; and others, that anciently the inhabitants of these coasts, when they would pass over, joined little boats together, and had them drawn over by bullocks, &c.

BOSSAGE, a projecting stone in architecture, laid rough in a building, to be afterwards carved into mouldings, capitals, arms, or the like.

BOSSAGES also denote stones which seem to advance beyond the naked of a building, by reason of indentures, or channels left in the joinings; used chiefly in the corners of buildings, and thence called *rustic quoins*.

The cavities or indentures are sometimes round, sometimes square, sometimes chamfrained, or beveled, sometimes in the diamond form: sometimes they are inclosed with a cavetto, sometimes with a listel.

BOTANY*, the science of plants; or that part of physiology, medicine, and agriculture, which treats of plants, their several kinds, forms, virtues, and uses.

* The word comes from the Greek *βοτανη*, *herb*; and that from *βοειν*, of *boas*, *I feed*; because most animals feed on herbs. See **PHYTOLOGY**, &c.

The most eminent *botanists* among the ancients, were Hippocrates, Theophrastus, Dioscorides, Pliny, Galen, &c.—In the sixteenth century, the ancient *botany*, which had been lost a great many ages, was industriously revived; principally by Leoniceus, Brasavolus, Cordus, Fuchsius, Matthiolus, Dalechampius, &c.—In the same age a number of other hands were added to the oar; by whose industry, the art was first brought into a system or body; as Gesner, Dodonæus, Cæsalpinus, Clusius, Lobel, Columna, Prosper Alpinus, the two Bauhins, Plukenet, Bocconi, &c.—Others have come since, and contributed to bring it still nearer perfection, viz. Morillon, Malpighi, Hermannus, Ray, Magnol, Tournefort, Sloan, Sherrard, Linnæus, &c.

BOTARGO, a sort of relishing mels, made of the roes of the mullet-fish; much used on the coasts of the Mediterranean, as an incentive to drink. *Penciol. Rer. Memor. P. 2. tit. ult. Shaw Trav. p. 155.*

The manner of preparing *botargo* as practised at Martegue in Provence is described by Mr. Ray.—The mullets, *mugiles*, are taken in *burdigs*, which are places in the shallows, inclosed with hedges of reeds. The male mullets are called *allettants*: the females *botar*, of the roes or spawn of which the *botargo* is made, thus:—

They first take out the spawn entire, and cover it round with salt for four or five hours: then they press it a little between two boards or stones; then they wash it; and at last dry it

in the sun for thirteen or fourteen days, taking it in at night.

Ray Trav. p. 396. seq.

BOTE, **BOTA**, in our old law-books signifies *compensation*, *recompence*, or *amends* for an injury done.

Hence *Man-bote*, satisfaction due for a man slain.

Hence also *boteless*, where no judgment or favour will acquit a man; as *v. gr.* for sacrilege, &c. And hence our common phrase to *bote*, speaking of something given by way of compensation.

Fire BOTE. } See the articles, { **FIRE-bote**.

House-BOTE. } { **HOUSE-bote**.

BOTTOM-Nails. See the article **NAIL**.

BOTTOMRY, in navigation and commerce, the act of borrowing money on a ship's *bottom*; that is, by engaging the vessel for the repayment of it, so as that, if the ship miscarry, the lender loses the money advanced; but if it arrives safe at the end of the voyage, the borrower is to repay the money lent, with a certain premium or interest agreed on: and this on pain of forfeiting the ship. See **ASSURANCE**.

BOTTOMY, or **BOTOME**, is used in speaking of a cross, which terminates at each end in three knots or buttons, resembling, in some measure, three-leaved grass. See **CROSS**.

A *cross botomy* is the same with what Segoin terms *croix trifolite*; and Baron, *globosa crux*: Gibbon, the better to explain the form, renders it *Crux ad singulas ejus extremitates in tres gemmas vel nodos, pro trifolii specie, terminata*. He bears argent a cross botomy fable, by the name of *Winwood*.—*V. Tab. Herald. fig. 11.*

BOUCHE*, of *Court*, the privilege of having meat and drink at court scot-free.

* The word is also written *bouche*, *bouge* and *budge*: it is mere French, where it signifies *mouth*.—The French still use the phrase, *Avoir bouche a la cour*, that is, to have table or diet at court.

This privilege is sometimes only extended to bread, beer and wine.—It was a custom anciently in use, as well in the houses of noblemen, as in the king's court.

BOULDER-Wall, a kind of walls built of round flints or pebbles, laid in a strong mortar; used where the sea has a beach cast up, or where there are plenty of flints.

BOULTINE, or **BOLTEL**, in architecture, the workman's term for a convex moulding, whose periphery is just $\frac{1}{2}$ of a circle; placed next below the plinth, in the Tuscan and Doric capital.—*See Tab. Archit. fig. 5.*

BOUND-Masonry.

Hide-BOUND.

Hoof-BOUND.

BOUNDARY-Column. See the article **COLUMN**.

BOUNDS of an Eclipse. See **ECLIPSE**.

BOUNDS of Lands. See **ABUTTALS**.

BOURGERMESTERS. See the article **BURGER-MAISTERS**.

BOURREE. See the article **BORER**.

BOU TANT*, in architecture.—An *Arc-BOUTANT*, is an arch or buttress, serving to sustain a vault; and which is itself sustained by some strong wall or massive-pile.

* The word is French, and comes from the verb *bouter*, to but, or a but.

A *Pillar BOUTANT* is a large chain or pile of stone, made to support a wall, terrace, or vault. *Devil*.

BOU TS-Rimez, a popular term in the French poetry; signifying certain *rhymes*, disposed in order, and given to a poet together with a subject, to be filled up with verses ending in the same words, and in the same order.

The invention of the *bouts rimez* is owing to one Du Lot, a poet, in the year 1649. In fixing the *bouts*, it is usual to chuse such as seem the remotest, and have the least connexion.

Some good authors fancy, that these rhymes are of all others the easiest, that they assist the invention, and furnish the most new thoughts of all others. Sarrafin has a poem on the defeat of the *bouts-rimez*.

The academy of Lanternists at Tholouze have contributed towards keeping in countenance the *bouts-rimez*; by proposing each year a set of 14, to be filled up on the glories of the grand monarch: the victorious sonnet to be rewarded with a fine medal.—An instance hereof may be given in the following one, filled up by P. Commire.

*Tout est grand dans le roi, l'aspect seul de son
Roi nos fiers ennemis plus froids que des
Et Qui l'aime n'attend que le tems des
Pour se voir succomber sous un bras si
Qu'on ne nous vante plus les miracles d'
Louis de bien regner lui seroit des
Horace en vain l'egale aux dieux dans ses
Mains que mon heros il étoit sage &*

BOW, *Arcus*, a weapon of offence made of wood, horn, or other elastic matter, which after being strongly bent, by means of a string fastened to its two ends, in returning to its natural state throws out an arrow with great force.

It is also called the *long-bow*; by way of distinction from the *cross-bow*, or *arbalist*.

The *bow* is the most ancient, and universal of all weapons.

It has been found to obtain among the most barbarous and remote people, and who had the least communication with the rest of mankind. The ancients ascribe its invention to Apollo.

The use of the *bow* and arrow was first abolished in France under Lewis XI in 1481; and in their place were introduced the Swifs arms, that is, the halbard, pike, and broadsword. See ARMS.

The long *bow* was formerly in great vogue in England; and may laws were made to regulate, and encourage its use. The parliament under Henry VIII. complain, "of the disuse of the long-bow, heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies." 33 H. 8. c. 6.

By 33 H. 8. c. 9. for every *bow* of yew, the bowyers of London were obliged to make two of elm, witch-hazel, ash or other wood; and the country bowyers, three.—But this law was afterwards repealed, so far as related to London; and (by 8 El. c. 10.) every bowyer was obliged to have always by him fifty good and able *bows* of elm, witch-hazel, or ash, well and substantially made, and wrought.—The best sort of *bows* of outlandish yew not to be sold for above 6s. 8d.—The second sort for 3s. 4d.—The coarse sort, called *livery-bows*, for 2s.—By 12 Ed. 4. c. 2. that *bows* might not be wanting, nor the price rise too high, every merchant who imported goods from Venice, or other place, from which *bow-staves* used to be brought, was for every tun of merchandize to import four *bow-staves*; in pain of 6s. 8d. for every *bow-stave* whereof default is so made. And (by 1 R. 3. c. 11.) ten *bow-staves* for every butt of malmsey; in pain of 13s. 4d. for every tun.

Bow, among builders, denotes a beam of wood, or brags, with three long screws that govern or direct a lath of wood or steel to any arch; chiefly used in drawing draughts of ships, and projections of the sphere, or wherever it is requisite to draw large arches.

Bow is also the name of an instrument formerly used at sea for taking the sun's altitude; consisting of a large arch of 90 degrees graduated, three vanes, a thank or staff, a shade-vane, a sight-vane, and an horizon-vane.—But it is now out of use.

Bow of a ship is that part of her which is broadest before: it begins at the loof, and compassing about towards the stem, ends at the sternmost part of the fore-castle.

If a ship have a broad round *bow*, they call it a *bold bow*; if they have a narrow thin *bow*, they say she has a *lean bow*.

The piece of ordnance that lies in this place is also called the *bow piece*; and the anchors that hang there, are called her *great and little bowers*. See BOWER, and ANCHOR.

Rain-Bow. See the article RAIN-BOW.

Bow-Bearer, an under-officer of the forest, who is to observe and take notice of all manner of trespasss against vert or venison; and to attach, or cause to be attached, the offenders, in the next court of attachment.

BOWER, an anchor carried at the bow of the ship. See ANCHOR.

There are usually two *bowers*, called *first* and *second*, or the *great* and *little bower*.

BOWL-Wassel. See the article WASSEL-BOWL.

BOWLING, or *Bow-LINE*, a rope fastened to the leech, or middle part of the outside of the sail in a ship, serving to make the sail stand sharper or closer by a wind.

The *bowling* is fastened by two, three, or four ropes, like a crow's foot, to as many parts of the sail; only the mizen-bowling is fastened to the lower end of the yard.

The *bowling* belongs to all sails, except the sprit-sail, and sprit-top-sail; where it is omitted for want of room to hale it forwards by; and thence it is, that those sails cannot be used close by a wind.

When they say, *Ease the bowling*, or *run up the bowling*; they mean, let it more slack.

BOWLING-Knot, denotes a knot that will not slip, by which the bowling-bridle is fastened to the crenels.

BOW-Saw. See the article SAW.

BOWSE, a sea-term, signifying as much as *hale*, or *pull* together.

Thus, haling upon a tack is called *bowsing-upon a tack*; and when they would have the men pull all together, they cry, *bowse away*.

BOW-SPRIT, or *BOLT-SPRIT*, a kind of mast in a vessel, standing foremost on the prow; and resting flapeways on the head of the main stem: its lower end is fastened to the partners of the fore-mast, and farther supported by the fore-stay: it serves to carry the sprit-sail, sprit-top-sail, and jacks-taff.—*Vid. Tab. Ship. fig. 1. n. 124. fig. 2. n. 16. See also the article MAST.*

The *bow-sprit* should be two-thirds of the length of the main-mast, and its thickness equal to the mizen-mast: when it is twelve fathoms five foot long, its yard must be eight fathoms two foot long; and the top-mast of the *bow-sprit*, three fathoms one foot.

BOW-STAVES. See GABLING of *Bow-staves*.

BOYAR, or *BOIAR*, a term used for a Russian lord, or grandee.

According to Becman, *boyars* are what in other countries are called the upper nobility: he adds, that the Czar of Muscovy, in his diplomas, names *boyars* before *waywodes*. See WAY-WODE.

BOYAU, in fortification, a branch of the trenches; or a line, or cut, which runs from the trenches to cover some spot of ground; being drawn parallel to the defence of the place, that it may not be enlarged, that is, that the shot from the town may not scour along it.

BOYLE'S Lectures, a course of sermons or lectures, set on foot by the honourable Robert Boyle, Esq; in 1691; whose design, as expressed by the institutor, is, to prove the truth of the Christian religion against infidels, without descending to any Controversies among Christians; and to answer new difficulties, scruples, &c.

For the support of this lecture, he assigned the rent of his house in Crooked-lane, to some learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late archbishop Tension, and others. But the fund proving precarious, the salary was ill-paid: to remedy which inconveniences, the said archbishop procured a yearly stipend of 50 pound, for ever, to be paid quarterly; charged on a farm in the parish of Brill, in the county of Bucks.

BOYLING. See the articles BOILING and EBULLITION.

BRACE is commonly taken for a couple, or pair; and in this sense is applied by huntmen to several beasts of game; as a *brace* of bucks, foxes, hares, &c.—They also say, a *brace* of greyhounds.

BRACE, in architecture, denotes a piece of timber framed in with bevil-joints; serving to keep the building from swerving either way.

When a *brace* is framed into a king-piece, or principal rafter, it is called by some a *strut*.

BRACE, *BRACCHIO*, or *Brasce*, also denotes a foreign long measure, answering to our fathom. See FATHOM.

BRACED, in heraldry, is used in speaking of chevrons which are intermingled. He bears azure a chief or, and three chevrons *braced*, in the base of the escutcheon, by the name of *Fitz-bugh*.—*V. Tab. Herald. fig. 17.*

BRACES, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two to each yard: being reeved through blocks fastened to pendants seized to the yard-arms.—*See Tab. Ship. fig. 1. n. 11. 21. 50. 68. 89. 112. 130. 139.*

The use of *braces* is, to square the yard; that is, to set it square.—Hence, to *brace the yard*, is to bring it to either side. To *traverse the yard*, is to set it any way over-thwart.—To *right the yard*, is to bring it so as it may stand at right angles with the length of the ship.

All *braces* come aftward on; the main-brace comes to the poop, the main-top-sail-brace to the mizen-top, and thence to the main-throuds; the fore and fore-top-sail *braces* come down by the main, and main-top-sail flays, and so of the rest.

The mizen-bowling serves for a *brace* to that yard; and the cross-jack *braces* are brought forward to the main-throuds, whenever a ship sails close by a wind.

BRACHIEUS, or *BRACHIALIS*, a name given to two muscles of the arm, the one external, the other internal.

BRACHIEUS Externus arises about the middle and posterior part of the humerus. It joins its fibres with the musculus longus and brevis; and being externally tendinous, they, together, cover all the elbow, and are inserted into the olecranon.—*See Tab. Anat. (Myl.) fig. 7. n. 12.*

BRACHIEUS Internus lies partly under the biceps; it rises by a fleshy beginning from the middle and internal part of the humerus; and is inserted into the upper and fore-part of the cubitus, by a very short but strong tendon: it serves to bend the arm.—*See Tab. Anat. (Myl.) fig. 1. n. 25. fig. 2. n. 14. fig. 7. n. 11.*

BRACHMANS, a branch of the ancient gymnosophists, or philosophers of India, remarkable for the severity of their lives, and manners.

The Greeks usually give them the name *gymnosophists*; though Clemens, Porphyry, &c. make the *brachmans* only a branch of the gymnosophists, whom they divide into two sects, *Brachmanes*, and *Samanes*.

There are some in the Indies who still bear the name, and live in the same manner as the ancient *brachmans*: the Portuguese call them *bramanes*, or *bramenes*; we usually, *bramins*.

Some say, they derive their name from the patriarch Abraham, whom, in their language, they call *bra-hma*, or *brama*. Others deduce it from the name of thei. God, *brachma*; which some again take to be the same with Abraham: whence Postel calls them *abrahmanes*. F. Thomassin fetches the word from the Hebrew, *barach*, to fly or escape; because the *brachmans* retire into the country, and live in deserts. The same author gives us another derivation, viz. from the Hebrew, *barach*, benedicere, orate, to bless, pray; in regard this is their principal occupation.

Porphyry observes, that the ancient *brachmans* succeeded into the

the order, by right of family; whereas the Samanæans were elected into it: the former therefore were all of the same family, the latter of various.

The *brachmans* were perfectly at liberty, paid no taxes, nor were under the command of any person: they lived on herbs, pulse, and fruits; abstaining from all animals, and thinking it an impiety to touch them. The greatest part of the day and night they spent in singing hymns in honour of the deity; praying, and fasting continually. The greatest part of them lived in solitude, without marrying, or possessing any estates. There was nothing they appeared to wish so earnestly for as death; looking on life as a burthenome thing, and waiting with impatience for the separation of their soul and body. This is the account Porphyry gives of them.

Kircher observes, that the *brachmans* held the opinion of Pythagoras, relating to the soul and its transmigration; and led a life in all respects agreeable to his: or rather, it was from the *brachmans*, that Pythagoras borrowed his opinions, his manner of living, &c.

The modern *brachmans* are the successors of the ancient, and the priests or divines of the idolatrous Indians. Rogers distinguishes five sorts of them; the *Wejnowa*, the *Seiva*, the *Smaerta*, the *Schaerwacka*, the *Pajenda*, and the *Tjchetea*.

These are much conversant in astrology and astronomy.

They have so great a veneration for cows, that it is said, they look on themselves as blessed, if they can but die with the tail of one of them in their hand. They sometimes make processions of 400 leagues, drawing after them whole cities and towns; feeding the people, when stopped at the passages of rivers overflowed, in a manner which is said to be miraculous; by giving them every thing they desire, without making any provision.

M. Marshall observes, that whenever they write any thing, they put a figure of one in the first place; to shew, as they say, that they acknowledge but one God. They account the world the body of God, the highest heavens his head, the fire his mouth, the air his breath, the water his seed, and the earth his legs and feet. They maintain a pre-existent state; and, from that, account for the tempers and manners of men in this: they also maintain the metempsychosis, but in a grosser sense than Pythagoras; believing, that the souls of ill men pass into reptiles, insects, and vegetables, for their punishment and purgation.—They compute the world to be about 3892850 years old; and seem to have some obscure traditions of the Mosiac paradise, Adam, Eve, and the deluge. They have also a notion of God's being incarnate, and living some time among men.

Their religion consists in leading a pure life, washing away their sins in the river Ganges, muttering over divers prayers, and doing strange and incredible penances.—They burn their dead with much ceremony; and strewing the ashes on the place where the deceased first lay after his death, they judge from some figure or impressions pretended to be made on it, into what body his soul is gone; viz. if the impression of the foot of a dog or ox, &c. appear, they give out he is transmigrated into one of those animals; if there be no impression, he is then gone to the starry region.

They have also abundance of cabalistical notions; v. gr. say they, the numbers 28, 35, 2, 7, 6, 3, 32, 31, — 34, 29, 8, 1, — 4, 5, 30, 33, written in the same order, in the squares of a square figure, and your enemy's name written under it, while you wear it he cannot hurt you, &c. See *Phil. Trans.* N° 268. See **BANIAN**.

BRACHYGRAPHY, (from *βραχυς*, short, and *γραφω*, scribo, I write) denotes the art of short-hand writing. See **TACHYGRAPHY**.

BRADS, a slender kind of nails, used in building, having no spreading heads as other nails have. See **NAIL**. Of these, some are called *joiners brads*, and are for hard wain-foot; others *batten-brads*, for soft wain-foot; and some *bill-brads* or *quarter-heads*, used when a floor is laid in haste, or for shallow joists subject to warp.

BRAILS in a ship, small ropes used in furling the sails across. The *brails* are reeved through blocks, which are seized on either side the ties, a little distance off upon the yard, so that they come down before the sails of a ship, and are fastened at the skirt of the sail to the cringles.—Their use is, when the sail is furled across, to hale up its bunt, that it may the more readily be taken up or let fall.—See *Tab. Ship. fig. 5. n. 6*. These *brails* belong only to the two courses and the mizen-sail. They say, *hale up the brail*, or which is all one, *brail up the sails*, the meaning of which is, that the sail is to be haled up, in order to be furled, or bound close to the yard.

BRAIN, in a general sense, is that large, soft, whitish mass, inclosed in the cranium or skull; wherein all the organs of sense terminate, and the soul is supposed principally to reside.—See *Tab. Anat. (Of the)* fig. 4. lit. a. a. d. d. d. fig. 5. lit. a. a. b. b.

The *brain* is encompassed with two meninges, or membranes, called *dura* and *pia mater*.

Its figure is the same with that of the bones that contain it, viz. roundish, oblong, and flat on the sides: it is divided in-

Vol. I.

to three principal parts, viz. the *cerebrum*, or *brain* strictly so called, the *cerebellum*, and the *medulla oblongata*: the two latter of which lie under their proper heads, **CEREBRUM**, and **MEDULLA**.

BRAIN, in a more proper sense, is that large globular part which fills the fore and upper part of the skull.

It is divided by a duplicature of the *dura mater*, called from its figure *falx*, into two equal parts, called *right* and *left hemispheres*; though the figure of the *brain* be pretty far from a sphere. It is also separated from the *cerebellum* by another duplicature of the same *dura mater*.

It consists of two kinds of substance; the one cineritious, or ash-coloured, soft and moist; which being the exterior, is also called the *cortex*, or *cortical part of the brain*: the thickness of this is about half an inch, though by reason of the sinus's and futures in the *brain* it appears more.—The other, or inner substance, is white, more solid, as well as more dry than the *cortex*, and is called the *marrow* or *medullary*, and sometimes the *fibrous part*, in contradistinction to the other, which is also called the *glandulous part*.

The *cortex*, according to Malpighi, is formed from the minute branches of the carotid and vertebral arteries; which, being woven together in the *pia mater*, send from each point thereof, as from a basis, little branches, which, being twisted together into the form of a gland, inclose the *medulla*, ordinarily to the thickness of half an inch; but in some places make deeper sinus's and furrows within it. These branches make circumsolutions like the intestines; each of which may be resolved into others, like, but less than the first.

This part, therefore, most authors take to be glandulous; or an assemblage of innumerable minute glands, contiguous to each other, destined for the secretion of animal spirits from the blood, brought hither by the carotids, &c.—These glands, Malpighi observes, are of themselves oval, but by their mutual compression they become angular; and run waving within each other: several of these connected form others larger; and these again unite into others, from the aggregate whereof are formed tubes, of which the outer *cortex* is composed.—These little glands consist of the branches of the arteries which bring the blood; of the veins arising at their extremities, which carry it back again; of secretory tubes concerning the animal spirits, and of excretory ducts for discharging them into the *medulla*: though these are too minute to have ever been seen. See **CORTICAL**.

The inner, or *medullary part of the brain* consists of a number of infinitely fine fibres, arising from the least and minutest branches or filaments of the glands of the *cortex*; as is distinctly seen in the *cerebellum*, though scarce visible in the *cerebrum*: these receive the fluid separated and subtilized, from the glands of the *cortex*; and by means of the nerves, which are no more than productions of this part, distribute it all over the body.

Authors, here, however, are divided; the generality, with Malpighi, making the substance of the *cortex* glandulous, as above; others, with Ruysch and Leewenhoek, deny any thing like glands in it; and allow nothing but little cryptæ, or sinks, opening laterally to the arteries; and thence receiving a juice already secreted from the blood, and transmitting it to the *medulla*.—This doctrine, it seems, is the result of anatomical injections and microscopical observations; but the other, appearing the most consistent with the œconomy of nature in other things, is generally adhered to.

The *cortex* covers the whole *medullary substance* both of the *brain* and *cerebellum*; so as wherever the cortical substance ends, there the *medullary* commences; and this in the appendices, ventricles, interstices, and sinus's of the *medulla*, as well as in the external surface. Something *medullary*, therefore, arising from every point of the *cortex*; at its first rise, it must needs be exceedingly fine and slender: but, being joined with other parts of the same kind, it gradually thickens, and at length becoming sensible, constitutes the *medulla cerebri*, the *corpus callosum*, the *medulla oblongata*, and its crura, the *thalami* of the optic nerves, the *medulla cerebelli*, and its production into the *medulla oblongata*; which, with these additions, forms the *corpora pyramidalia* and *olivaria*, and is extended into the spinal marrow.—And from the same *medullary substance*, both in the cranium, and in the case formed by the union of the vertebrae, arise all the nerves. See **NERVE**; see also **CORPUS PYRAMIDALE**, &c. Though the primary fibrillæ, or filaments, when united, seem to form one compact body or mass; yet Boerhaave shews, they are really distinct and separate from each other: that thus arising from each part of the *cortex*, and tending as it were to the centre of the sphere, they first form the *medulla*; that others, reflected hence and collected above, form the *corpus callosum* and *fornix*; and below, form the *corpus callosum* and legs of the *medulla oblongata*; that the like fibrillæ, arising from the *cerebellum*, join with them: the result of which juncture is the *medulla spinalis*. And lastly, that the like fibrillæ arising from the *cortex*, continued within the cavities of the *medulla*, join with them, and add fresh confidence thereto.

Hence we see the reason of the bulk, figure, and position of

the cortex of the *brain*, as well as the use and necessity of the cavities called *ventricles* of the *brain*: of these ventricles there are four; one in each hemisphere, separated by a thin transparent substance, running all along from the fornix under the corpus callosum, and distinguished by the name of the *septum lucidum*: these two are called the *lateral ventricles*.

The third is under the fornix, and called *rima*: the fourth between the cerebellum and medulla oblongata.

From the whole, it appears past doubt, that the fibres of the *brain* are exceedingly minute canals; that they receive an humour, infinitely the most subtle, fluid, and moveable, of any in the whole body; prepared and secreted by the artful structure of the cortex, driven into these tubules by the force of the heart, and from every part hereof collected into the medulla oblongata.—And this is what some call *animal spirits*, others the *nervous juice*; the great instrument of sensation, muscular motion, &c.

In the space between the two hemispheres of the *brain*, under the falx, or rather under the longitudinal sinus of the dura mater, is a white substance of a texture more compact than the rest of the medulla of the *brain*; and for that reason called *corpus callosum*, which runs along the whole tract of the falx, and receives from each side the terminations of the medulla, interposed between the several windings of the cortex, and supposed by some to be a kind of bafe or support to it.—The manner wherein this is formed is shewn above: we shall only add, that, on occasion hereof, some authors, M. Astruc for instance, instead of two substances, viz. the cortex and medulla, divide the *brain* into three; viz. the uppermost, or *cineritious*, which constitutes the cortex; the middle, which is whiter and denser than the first, and therefore called the *callosus*; and the lowest or innermost, which being intermixed with radii or striæ of the white and cineritious substance, he calls the *striated* part: Astruc adds, that the fluid secreted in the cortex is conveyed into innumerable minute hollow medullary fibrillæ, of the same nature with the callous substance, and contiguous thereto. This middle, or callous part, he observes, is not distinguished by any appearance of fibres, but is uniform, homogeneous, elastic, and not unlike the pith of the elder-tree: for which reason, he thinks it may be probably conjectured, to consist of innumerable cells, communicating with each other, divided by the interposition of membranaceous, flexible, elastic, vibrative parietes or columns; which being flowed over by the spirits, and continually exposed to the shakings thereof, constitute the fibres of the *brain*.

Now the secreted fluid flowing equally from each point of the cineritious substance into the callous, must equally fill and distend the cells thereof: and left any place should want its share, provision is made for a strict communication; not only by the apertures of the cells into each other, but also by the structure of the *brain*; the upper part communicating with the under, by the septum lucidum; the lateral with the lateral, by the lata commissura; lastly, the fore-parts with the hind-parts, by the crura, brachia, and roots of the fornix. These cells, he continues, being filled, the spirits will proceed to the contiguous striæ of the medullary substance; which, arising from the cortex, compose the striated part of the *brain*: and these striæ rendered narrower and slenderer, and passing without the surface of the *brain*, constitute the first principles of the nerves, &c.

The other parts of the *brain* are the fornix, a production of the medulla: which, at its extremity next the cerebellum, sends out two processes or legs, by whose juncture is formed a kind of arch, thence called *fornix*, which separates the third ventricle from the two upper ones.—At the bottom of the fornix are two holes, by which the third ventricle has a communication with the others; that before is called *vulva*, and that behind *anus*.—The third ventricle, or *rima*, which is in the medulla oblongata, has likewise two apertures; the one the orifice of the *infundibulum*, or funnel, which is a canal reaching to the glandula pituitaria: the other is a duct, whereby the third ventricle communicates with the fourth in the medulla oblongata, under the cerebellum. That fourth ventricle is in the form of a quill, whence it is sometimes called *calamus scriptorius*.

In the lateral ventricles are found the *plexus choroides*, which is an assemblage of minute veins and arteries; and four eminences, the first the *corpora striata*, the others the *thalami nervorum opticorum*.

At the entrance of the canal reaching from the third ventricle to the fourth, is situated the *pineal gland*; so called from the figure of a pine-apple, which it resembles: this gland Des Cartes supposes to be the seat of the soul. Behind the pineal gland are four eminences; two upper and greater, called *nates*; and two smaller and lower, called *testes*. See *MEDULLA Oblongata*, to which all these parts properly belong; see also each part under its proper head, *NATES*, *TESTES*, &c.

The vessels of the *brain*, are nerves, arteries, and veins.—By turning up the *brain*, the origins of the nerves proceeding from it are distinctly seen: these are in number ten pairs, viz. the olfactory, optic, movers of the eyes, pathetic;

the fifth pair, and sixth pair, called also the gustatoricæ, the auditory nerves, par vagum, and the ninth and tenth pair.

The blood-vessels of the *brain*, are the two internal carotid, and the vertebral arteries.—The first, piercing the dura mater, communicate with the cervicals, and proceeding thence send a branch to the plexus choroides; till arriving at the pia mater, and making several turns and circumvolutions thereon, they terminate, at last, in the little lands that constitute the cortex.—The vertebral arteries, passing the dura mater, go along the under side of the medulla oblongata; till giving branches to the spinal arteries, they join in one branch called the cervical artery, which communicates with the carotides by two branches, as before.—The veins of the *brain* do not run along by the sides of the arteries, as in other parts of the body, but rise from their extremities in the cortex; whence they discharge themselves into the sinus of the dura mater.

For the great bulk of the *brain*, this reason may be assigned; viz. that on account of the exceeding subtilty and fineness of the animal spirits, and the slowness in which their secretion must be effected; together with the great quantity of them required in discharging the animal functions; there must of necessity be an infinite number of glands to separate and prepare them.—From the same principle, we see why the *brain* is much bigger in men than in other animals; and in other animals, why, *ceteris paribus*, it is generally biggest in those which discover the greatest share of sagacity, v. gr. in monkeys; by reason a considerable flock of animal spirits is to be employed in the affairs of cogitation, memory, &c. Accordingly, anatomists observe, that in fools the *brain* is smaller (*ceteris paribus*) than in men of sense: this, some may account for, by supposing it the cause of the folly; a sufficient flock of spirits being wanting to reason strongly: and others from the economy of nature, which proportioned the flock of spirits to the expence that would be required.

From the texture, disposition, and tone of the fibres of the *brain*, philosophers ordinarily account for the phenomena of sensation and imagination.—Dr. Astruc goes further, and from the analogy between the fibres of the *brain*, and those of musical instruments, solves the phenomena of judgment and reasoning, and the defects and perfections of both.—He lays it down as an axiom, that every simple idea is produced by the oscillation of one determinate fibre; and every compound idea from cotemporary vibrations of several fibres: that the greater or less degree of evidence follows the greater or less force where the fibre oscillates. Hence he proceeds to shew, that the affirmation or negation of any proposition, consists in the equal or unequal number of vibrations, which the moving fibres, representing the two parts of the proposition, make in the same time: i. e. if the vibrations of the fibre that gives the idea of the subject, and those of the fibre which gives the idea of the attribute of a proposition, be isochronal, or make an equal number of vibrations in the same time, we are determined to the affirmation of the proposition; if heterochronal, or the vibrations be unequal, the soul will be determined to a negation, &c. Hence result consonant, dissonant, and harmonical fibres, &c.—The evidence and certainty of a judgment, whether affirmative or negative, he deduces from the greater or less consonance or dissonance of the fibres of the subject and attribute; and a right or wrong judgment from the natural or depraved tone of the fibres of the *brain*.

Hence he takes occasion to observe, that the fibres of the *brain*, from their natural analogy to those of musical instruments, may be perverted several ways; viz. by being rendered too dry or too moist, too stiff or too lax, &c. In a phrensy, he thinks the fibres too dry, and too much distended by the heat of the blood, &c. In a mania, these fibres he thinks too rigid, as well as too dry and distended. In a lethargy, they are too much softened by phlegm; in idiocy, or foolishness, they are sometimes too soft, and sometimes too hard. Lastly, he thinks that in melancholy, by the repeated successive vibrations which the attentive meditation of a thing induces, two or more fibres, which of themselves exhibit dissimilar and unequal ideas, are (the other parts remaining sound) sensibly brought to an isochronism: so as the soul judging well in other respects, yet in this always makes a false judgment.

The *brain* does not appear absolutely necessary to animal life. We have several instances in authors, of children brought forth alive, and surviving their birth for some time, without any *brain*: and there are some anatomical instances, of animals surviving the loss of their *brain*. Of the first kind, we have a history from Paris, of a child delivered at maturity, and living four days, not only without a *brain*, but even a head: instead of both which, was a mass of flesh like liver found. M. Denys gives another instance, of a child born in 1673, which, setting aside the head, was well formed, but without any *brain*, cerebellum, or medulla oblongata: it had not any cavity for a *brain*, the skull, if such it might be called, being solid: nor was this any way connected to the vertebrae; so that the marrow in the spine had no communication

nication with the head: the optic nerves terminated in the solid bone. M. le Duc gives a third instance, in 1695, where there was neither cerebrum, cerebellum, medulla oblongata, nor even spinal marrow; the cavity that should contain them being extremely shallow, and full of a black livid substance, like congealed blood: he adds, this was the third subject of the kind he had met with. Dr. Preston, indeed, tells us, that M. du Verney found here a spinal marrow, though of much less consistence than ordinary: in which, however, he could distinguish all the four tunics, and the two substance, viz. the cortical and fibrous part, as in the brain. In a word, he takes this to be a brain itself, as much as that in the skull; nay, more so, being more necessary to life, and more sensible, than either the brain or the cerebellum: a wound or compression in the first being always mortal; not so in the latter; as appears from the experiments of M. du Verney and M. Chirac; the first of whom took out the brain and cerebellum of a pigeon; notwithstanding which it lived, fought food, had sense, and performed the common functions of life: the latter took out the brain from a dog, yet it lived; upon taking out the cerebellum it died; but by blowing into the lungs, he observes, he could keep the animal alive, an hour after the loss of the cerebellum. Upon separating the medulla oblongata of another dog from the spinal marrow, and removing it with the brain and cerebellum, he kept the dog alive by blowing into the lungs.—To which may be added, many instances given by Mr. Boyle, not only of animals living a long time after the separation of the head from the body, but even of the copulation and impregnation of some insects under those circumstances: whence it appears, that the spinal marrow is sufficient, on occasion, for the business of sensation, motion, secretion of animal spirits, &c.

Traces of the BRAIN. See TRACE.

BRAN, the skins or husks of corn, especially wheat, ground, separated from the farina or flour, by a sieve or boulder. Of *wheat-bran* it is that starch-makers make their starch; which is nothing else but the fecula remaining at the bottom of the vessels, wherein the bran has been steeped in water.

BRANCH*, in botany, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head or crown hereof.

* The word, according to Salmassius, comes from the Latin *branca*; in the lower Latin, they said *barga*: others derive it from *brachium*, an arm; and others from *branchie*, the gills of fishes.

The *branches* of trees, some have observed, almost constantly to shoot from the trunk at an angle of 45 degrees: the reason is, that the whole spreading being generally confined within an angle of 90 degrees, as the most becoming and useful disposition; that space could not be well filled up any other way, than by forming all the interfections which the shoots and branches make, with angles of 45 degrees only. A strong argument, that the plastic powers of matter, are under the guidance of a wise being!

Branches are distinguished into various kinds:

Wood BRANCH, according to Quintiny, is such a one as, shooting out from a cut of the preceding year, is naturally of a considerable thickness.

Fruit BRANCH is that which shoots out of a moderate length and breadth from the same cut or pruning.—*Fruit-branches*, he adds, have large eyes, and are very near each other.

BRANCH Half-Wood is that which, being too slender for a wood-branch and too big for a fruit-branch, is cut off, at the length of two or three inches, to make it produce a better shoot, whether wood or fruit.

Spurious Wood-BRANCHES are such as come contrary to the order of nature; or otherwise than from cuts of the preceding year; or which coming on such cuts, are big in the place where they should be small.

To understand this order of nature, it must be observed, 1. That *branches* should never come, except on those of the last cut; such, therefore, as shoot from other parts are spurious. 2. The order of the new *branches* is, if there be more than one, that the extreme branch be thicker and longer than that immediately under it; and this bigger and longer again than the third, &c. Hence, if any be big where it should be small, it is called *spurious*.

There are, however, some exceptions: in trees that are vigorous, and yet bear a handsome figure, there cannot well be too many *fruit-branches*; provided they make no confusion; but for *wood-branches*, there should not ordinarily be above one suffered to grow, of the several which shoot from each cut of the preceding year. See PRUNING.

Engrafting of BRANCHES. See the article ENGRAFTING.

BRANCHES of Oives, the reins or arches of Gothic vaults; which traversing from one angle to another, diagonal-wise, form a cross between the other arches which make the sides of the square, whereof those arches are diagonals.

BRANCHES of a bridle, in the manage, are two crooked pieces of iron which support the mouth-bit, the chain, and the curb, and which are fastened on one side to the head-stall, on the

other to the reins; serving to keep the horse's head under command.

What way soever the *branches* of the bit incline, the horse's mouth goes to the contrary. The duke of Newcastle is very particular on the head of *branches*; explaining their several kinds, and their effects, which are reducible to those of a lever.—The *branch* is always to be accommodated to the design, either of bringing in, or raising a horse's head, and to the necessary degree; accordingly, we have strong and hardy *branches*, gentle *branches*, rude *branches*, &c.

With regard to their form and structure, *branches* are either strait, in form of a pistol, for young horses to form their mouth; or, after the constable of France's fashion, for horses that already carry the head well: others are in form of a gigot or leg; others of a bent knee; others in the French fashion, &c.

These are laws in the manage, 1. That the farther the *branch* is from the horse's neck, the more effect it will have. 2. That short *branches*, *cæteris paribus*, are ruder, and their effects more sudden than those of longer. 3. That the *branch* is to be proportioned to the length of the horse's neck.

BRANCHED Velvet. See the article VELVET.

BRANCHIA, *βραγχία*, a name given by the ancient naturalists to the gills of fishes; which are parts composed of cartilages and membranes, in form of leaves; and serving instead of lungs to perspire by.—See Tab. Anat. (Splanchn.) fig. 14.

The *branchia*, Galen observes, are full of little foramina, big enough to admit air and vapours, but too fine to give passage to water. Pliny held, that fishes respired by their gills; but he observes that Aristotle was of another opinion: to whom we may add, among the moderns, Dr. Needham. See SUPPLEMENT, article GILLS.

BRANDY properly denotes a proof-spirit, obtained by simple distillation from real wines, or fermented juices of grapes. The vessels used herein, are usually of copper: and distillers, to cool the liquor more readily, make the neck of the matras, which is very long, and winding like a serpent, pass through a vessel of cold water.

To distil BRANDY, they fill the cucurbit half full of the liquor from which it is to be drawn; and raise it, with a little fire, till about one sixth part be distilled; or till they perceive that what falls into the receiver is not at all inflammable.

The liquor, thus distilled the first time, is called *brandy*; which spirit, purified by another, or several more distillations, is what we call *spirit of wine rectified*.—The second distillation is made in balneo marie, and in a glass cucurbit; and the liquor put therein is distilled to about one half the quantity: which half is further rectified, as long as the operator thinks fit.

To abridge these several distillations, which are long and troublesome, they have invented a chymical instrument, whereby the rectification of spirit of wine is performed, at one single distillation: the description and figure of which instrument may be seen in Glaier's *Chymistry*.

To try the goodness of rectified spirit of wine, it must be lighted into a blaze: if then it consumes wholly, without leaving any impurity behind; or, which is surer still, if after putting a little gun-powder in the bottom of the spirit, the gunpowder take fire when the spirit is consumed, the liquor is good.

Those who deal in *brandy*, (we speak only of that made with wine) chuse it white, clear, of a good taste, and such as will bear the test or proof; i. e. such as in pouring into a glass, forms a top of it a little white lather, which, as it diminishes, makes a circle, called by the French *brandy* merchants, the *chapelet*, by the English the *head* or *bubble*; there being no *brandy* but that well deslegmated, and which retains no superfluous humidity, wherein the head will be entirely formed.

The chief use of *brandy*, is as a drink; especially in the cold northern countries; among the negroes in Guiney, who sell one another for a few bottles of *brandy*; and among the savages of Canada, and other parts of north America, who are infinitely fond of it. It is of some use too in medicine; being said to strengthen the nerves: and in dying, when raised into rectified spirit of wine, being one of the dyers non-colouring drugs.

The greatest part of the *brandies* in use, and those too, the best, are prepared in France: of the French *brandies*, those of Bourdeaux, Rochel, Cognac, Nants, and Poitou are the most esteemed; as being of a better taste, finer and stronger, and enduring the bubble-proof longer than any of the rest: those of Anjou, Touraine, and Orleans, claim the second place. They are chiefly sent to Paris and Flanders by the river Loire.

Brandy makes a very considerable article in the French commerce: the number of foreign vessels, wherewith all their ports are full in time of peace, and which are laden, in good measure, with *brandy*, is incredible. Nants alone furnishes 174000 gallons per annum, and Bourdeaux above

twice as much; the other places in proportion. The Dutch take off their hands almost as much as all the rest of Europe. Poland and Sweden are the only nations which are not their customers; these preferring the corn brandies of their own countries, made of grains, to the wine brandies of France. Of brandy, both plain and rectified, are prepared various kinds of strong liquors, with the addition of other ingredients, sugars, spices, flowers, fruits, &c. which are afterwards clarified, by passing them through a straining bag, or filtering them through brown paper.—Such are cinnamon waters, anised waters, fennel waters, fellery waters, citron waters, &c. A great part of these are brought from Montpellier; where they are supposed to be better prepared than any where else. See SUPPLEMENT, article BRANDY.

Cherry BRANDY. See the article CHERRY.

BRASIL. See the article BRAZIL.

BRASS, a factitious metal, composed of copper fused with lapis calaminaris, which gives it a hardness, and yellowness. The manner of making brass is said to have been kept a secret in Germany for many ages.—The method of preparation among us is as follows. The lapis calaminaris being calcined, and ground as fine as flour, is mixed with ground charcoal; and incorporated, by means of water, into a mass: thus prepared, about seven pounds of the calamine is put into a melting-pot of about a gallon; and over it, about five pounds of copper; which is let down into a wind-furnace eight foot deep, remaining there about eleven hours; in which time it is converted into brass.—After melting, it is cast into plates, or lumps: forty-five pounds of crude calamine, produces thirty pounds burnt, or calcined, and sixty pounds of copper make, with calamine, an hundred pounds of brass.

They sometimes use brass-flux instead of copper; but that is not always to be procured in quantities sufficient; being no more than a collection of pieces of old brass.

Pure brass is not malleable unless hot; when cold it breaks: after melting twice, it is no longer in a condition to bear the hammer at all: to work it, they put seven pound of lead to an hundred of brass; which renders it more soft and pliable.

The best brass guns are made of malleable metal, not of pure copper and calamine alone; but it is necessary to add coarser metals, to make it run close and sounder, such as lead and pot-metal.

The best proportion for gun-metal, it is said, is for eleven or twelve thousand weight of metal, to use ten thousand pound of copper, nine hundred pounds of tin, and six hundred pounds of brass; but the proportion is variable, according to the quality and goodness of the copper.

Bell-metal is a composition of brass and tin: and pot-metal of brass and lead; twenty pound of lead, is usually put into an hundred pound of pot-metal.

Corinthian BRASS, or Corinthum, has been famous in all antiquity: L. Mummius having sacked and burnt the city Corinth, 146 years before our Saviour's time, it is said this precious metal was formed from the immense quantities of gold, silver and copper wherewith that city abounded, thus melted and run together by the violence of the conflagration.—The statues, vessels, &c. formed of this metal were ineffable: those who speak of it accurately, distinguish it into three kinds; in the first, gold was the prevailing metal; in the second, silver; in the third, gold, silver and copper were equally blended.

BRASS wire. See the article WIRE.

BRAVA Pareira. See PAREIRA brava.

BRAZIL, or BRASIL, an American wood, commonly supposed to have been thus denominated, because first brought from Brazil: though Huet shews it had been known by that name many years before the discovery of that country. *V. Huetiana*, p. 268.

It is denominated variously, according to the places whence it is brought. Thus we have *brazil* from Fernambuc, *brazil* of Japon, of Lamon, of St. Martha; and lastly *brazillette*, or Jamaica wood, brought from the Antilles.

The *brazil* tree ordinarily grows in dry barren places, and in the middle of rocks; it is very thick and large, usually crooked and knotty: its flowers, which are of a beautiful red, exhale a very agreeable smell, which strengthens the brain. Though the tree be very thick, it is covered with so gross a bark, that when the savages have taken it off the wood, or trunk, which before was the thickness of a man, is scarce left equal to that of his leg.

Brazil wood is very heavy, dry, it crackles much in the fire, and scarce raises any smoke, by reason of its extreme dryness. None of the several kinds have any pith, except that of Japon: that of Fernambuc is esteemed the best. It must be chosen in thick pieces, close, sound, without any bark on it; and such as, upon splitting, of pale becomes reddish; and when chewed has a saccharine taste.—It is much used in turned works, and takes a good polish; but its chief use is in dyeing, where it serves for a red colour: it is a spurious colour, however, that it gives; and easily evaporates and fades: nor is the wood to be used without allum and tartar.

From the *brazil* of Fernambuc is drawn a kind of carmine,

by means of acids: there is also a liquid lacca made of it, for miniature.

BRAZING, the soldering or joining of two pieces of iron by means of thin plates of brass, melted between the two pieces to be joined.

If the work be very fine, as when the two leaves of broken saws are to be joined, it is to be covered with beaten borax, moistened with water that it may incorporate with the brass-dust which is here added; and the piece is exposed to the fire without touching the coals, till the brass be observed to run. To *braise* with a still greater degree of nicety, they use a folder made of brass, with a tenth part of tin; or another, one third brass, and two thirds silver; or borax and rosin: observing, in all these manners of *brazing*, that the pieces be joined close throughout; the folder only holding in those places that touch.

The method of *brazing* among farriers, &c. is by heating the two pieces, when hot, over one another: this is more properly called *welding*.

BREACH, in fortification, is a hole, gap, or aperture, made in any part of the works of a town, either by playing cannon, or springing mines; in order to storm the place, or take it by assault.

They say, make good the *breach*; fortify the *breach*; make a lodgment on the *breach*: To clear the *breach* is to remove the ruins, that it may be the better defended.

A practicable *breach* is that where the men may mount, and make a lodgment.—A *breach* ought to be 15 or 20 fathoms wide.—The assailants make their way to it, by covering themselves with gabions, earth-bags, &c.

To batter in BREACH, battre en brèche. See BATTERING.

BREAKING bulk, the beginning to take a ship's lading or cargo out of the hold.

BREAKING ground, in the military art, the beginning of works for carrying on the siege of a place; more especially the beginning to dig trenches, or approaches. See SIEGE, TRENCH, and FORTIFICATION.

BREAMING. See the article BROOMING.

BREAST, *mamma*, in anatomy, a prominent fleshy part of the human body, on the outside of the thorax, serving to separate the milk.

The breasts are much more perfect, more conspicuous, and of more use in women than in men: their magnitude is various; always biggest in time of gestation and lactation. Their figure represents a large section of a globe, having in the middle a prominence terminating in a blunt point, called the *papilla*, or nipple; in the extremity of which are perforations, to which reach lacteal tubes.—About the nipple is a pale brownish circle, called the *areola*.

The internal substance of the *breast* is composed of a great number of glands, of various sizes, and an oval figure, intermixed with globules and vessels of fat. Their excretory ducts, as they approach the nipple, join and unite together, till at last they form seven eight or more small pipes, called *tubuli lactiferi*, which have several cross canals, by which they communicate with one another, to obviate the inconveniences that might accrue from the casual obstruction of one or more of them.—These tubes are not every where of equal capacity, but in some places more, in others less dilated; so as to form cells, which seem contrived to hinder the spontaneous efflux, and to create a necessity of sucking, to fetch out the contents.

Of the concurrence of these tubuli or pipes is the substance of the *papilla* in great measure formed; among which is interperfed a glandulous substance, serving to keep them from pressing too close on each other: and with it are intermixed abundance of fibres derived from the external teguments of the *papilla*; by means whereof, the lacteal tubes are constricted, and the motion of the milk is modified.

Besides these vessels are abundance of fatty globules, called *dusini adiposi*, which some would have only to fill up the interstices of the glands: but Dr. Drake, after Malpighi, thinks they contribute to the composition of the milk; which seems nothing else but water and oil artfully united. See MILK. In virgins, the tubes which compose the glands of the *breasts*, like sphincter-muscles, contract so closely, that no part of the blood can enter them: but when the womb grows big with a fetus, and compresses the descending trunk of the

great

great artery, the blood flows in greater quantity, and with a greater force through the arteries of the *breasts*, and forces a passage into their glands; which, being at first narrow, admits only of a thin water; but growing wider by degrees, as the womb grows bigger, the glands receive a thicker serum; and after birth they run with a thick milk; because that blood which before flowed to the fetus, and for three or four days afterwards by the uterus, beginning then to stop, does more dilate the mamillary glands.

In men, the *breasts* are very small, and are chiefly for ornament; though physical histories give instances of those who have had milk in them.

BREATHING. See the article **RESPIRATION**.

BREEDING of fish. See the article **FISH**.

BREEZE, a shifting wind, blowing from the sea and land alternately, during certain hours of the day or night; only sensible near the coasts.

The *sea-breeze*, Dampier observes, commonly rises in the morning about nine, proceeding slowly in a fine small black curl on the water towards the shore: it increases gradually till twelve, and dies about five.—Upon its ceasing the *land-breeze* commences, which increases till twelve; and is succeeded in the morning by the *sea-breeze* again.

BREEZE, in brick-making are small ashes and cinders sometimes made use of, instead of coals, for the burning of bricks. But, as this does not so well answer the end, the use of it is prohibited by 12 G. 1. c. 35.

BREGMA, in anatomy, the same with *sinciput*. See **SINCIPT**.

The *bregma* consists chiefly of two bones, hence also called *bregma*, or *bregmatic ossa*, which are two bones of the cranium, otherwise called *offa parietalia*.

BREST, or **BREAST**, in architecture, a term used by some, for that member of a column otherwise called the *Tore*.

BREST-SUMMERS, or **BRESSUMERS**, in timber-buildings, are pieces in the outward parts, and in the middle floors, into which the girders are framed.

In the inner parts of a building, the pieces into which the girders are framed are called *summers*. See **SUMMER**.

BREVE, **BREVIS**, *short*, in grammar.—Syllables are distinguished into *longs* and *breves*, according as they are pronounced quicker or more slow: the time of a *breve* is half that of a *long*; or, as the grammarians express it, a *breve* is one time, and a *long* two. See **ACCENT**.

BREVE, in music, is a note or character of time, formed square, without any tail; and equivalent to two measures, or femibreves. See **SEMIBREVE**, and **CHARACTERS of music**.

BREVE vas. See the article **VAS breve**.

BREVIARY, among ecclesiastical writers, denotes the office, or service both for day and night, as performed in the Romish churches.

BREVIARY, is more frequently used for a church-book, containing the office of the *breviary*, that is, the prayers, and other parts of the service, with the several variations to be made therein, according to the several days, canonical hours, feasts, and the like.

D. Mege derives the name *breviary* from hence, that the ancient monks in their journeys, &c. had little books, wherein were the psalms and lessons, read in the choir, collected out of large volumes: and F. Mabillon tells us, he has seen two such books in the archives of Cîteaux; they were not above three fingers broad: their letter was exceedingly small, and consisted mostly in abbreviations, expressing a whole period in a few syllables: whence they had a good title to the appellation of *breviaries*, q. d. *abridgements*.

The Roman *breviary* is general, and may be used in every place: but on the model of this have been built various others, peculiarly appropriated to each diocese, and each order of religious.

The *breviary* consists of the services of mattins, lauds, prime, third, sixth, nones, vespers, and the complines, or post-communion; that is, of seven different hours: on account of that saying of David, *Septies in die laudem dixi tibi*. See **HOURS**.

The obligation of reciting the *breviary* every day, which was at first universal, by degrees was reduced to the beneficiary clergy alone, who are bound to do it on pain of mortal sin, and of refunding their revenues, in proportion as they are delinquent herein.—In the fourteenth century, there was a particular reservation in favour of bishops, for passing, on occasion, three days without rehearsing the *breviary*.

The institution of the *breviary* not being very ancient, the lives of the saints were inserted in it, agreeable to the opinions of the times; i. e. full of ridiculous ill-affected facts; which gave a handle to several purgations, or reformations thereof by several councils, particularly those of Trent and Cologne; by several popes, as Pius V. Clement VIII. and Urban VIII. as also by several cardinals and bishops, each of whom lopped off some of the extravagancies, and brought the work nearer to the simplicity of the primitive offices; as acknowledging that in the ancient church there was nothing read but scripture itself.—Cardinal Quignon carried the reformation the farthest; leaving out the little office of the virgin,

VOL. I.

the verses, responses, and a great part of the lives of the saints.

The *breviaries* now in use, are almost innumerable: the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-mary's, credo's, magnificats, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, hallelujah's, gloria patri's, &c.

The most eminent, after the Roman *breviary*, are, that of the Benedictines, that of the Bernardines, of the Chartreux, of the Præmonstratenses, of the Dominicans, the Carmelites, the Franciscans, and Jesuits; also that of Cluny, of the church of Lyons, the church of Milan, and the Mozarabic *breviary*, used in Spain.—But in reality there is scarce a church in the communion of Rome, in France, Flanders, Spain, Germany, &c. but what has something particular in the form and manner of its *breviary*: though the differences are generally inconsiderable. See **GALLICAN**, **AMBROSIAN**, &c.

The *breviary* of the Greeks, which they call *ὁρθόγραφον, ὁρολόγιον*, q. d. dial, is the same, to a trifle, in almost all the churches and monasteries that follow the Greek rite. The Greeks divide the psalter into twenty parts, *καθίσματα*; which are a kind of rests, pauses, or flattons: and each pause is again subdivided into three parts.—In the general, the Greek *breviary* consists of two parts: the one containing the office for the evening, called *παραβόλιον*; the other that for the morning, consisting of mattins, lauds, prime, tierce, sixth, nones, vespers, and complines.—The *breviary* of the Maronites contains some more considerable variations.

Among the people who speak the Slavonic language, or any of its dialects, the *breviary* is rehearsed in the vulgar tongue; as among the Maronites in Syriac, among the Armenians in Armenian, &c.—Those who rehearse the *breviary* in the Slavonic, are divided as to the rite: some following the Roman or Latin rite, as the inhabitants of Dalmatia, and the neighbouring coasts: whereas those who live farther within the continent, as in Hungary, Bosnia, Slavonia, &c. and in Poland, Lithuania, and Muscovy, follow the Greek rite.—The *breviaries* of the Copts and Abyssinians are much alike.

BREVIATOR, an officer under the eastern empire; whose business was to write and transcribe briefs.—At Rome, those are still called *breviators*, or *abbreviators*, who dictate, and draw up the pope's briefs.

BREVIS cubiti, in anatomy, one of the extensor muscles of the cubitus, arising from the external spine of the humerus.

BREVIS radii, one of the supinator muscles of the radius, arising partly from the external condylus of the humerus, and partly from the upper and exterior part of the ulna; and inserted into the superior part of the radius, which it embraces wholly: and serves to turn the pal. of the hand upwards.

BREVIS is also used by some for the third of the extensors of the carpus, which arising from the lower part of the humerus, and running along the radius, terminates in the bone of the carpus, which sustains the middle finger.

Some anatomists join this with the second extensor, and call them *bicornts*, or *radialis externus*: others chuse to distinguish them, in regard they have different origins, and insertions; and that their bellies are separable. See **EXTENSOR**.

BREVIS extensor pollicis pedis.

BREVIS flexor pollicis pedis.

BREVIS peroneus.

BREVIS pronator radii.

BREVIUM cufios.

BREVIUM falso retorno.

BREWED wine. See the article **WINE**.

BREWING, the operation of preparing ale, or beer from malt.

The usual process of *brewing* is as follows.—A quantity of water being boiled, is left to cool, till the height of the steam be over; when, so much is poured to a quantity of malt in the mashing-tub, as makes it of a consistence stiff enough to be just well rowed up: after standing thus a quarter of an hour, a second quantity of the water is added, and rowed up as before. Lastly, the full quantity of water is added; and that in proportion as the liquor is intended to be strong or weak.—This part of the operation is called *mashing*. The whole now stands two or three hours, more or less, according to the strength of the wort, or the difference of weather, and is then drawn off into a receiver; and the mashing is repeated for a second wort, in the same manner as for the first; only the water to be cooler than before, and not to stand above half the time.

The two worts are then to be mixed, the intended quantity of hops added, and the liquor close covered up, gently boiled in a copper the space of an hour or two; then let into the receiver, and the hops strained from it into the coolers.—When cool, the barm or yeast is applied; and it is left to work, or ferment, till it be fit to tun up.

For small beer, there is a third mashing, with the water near cold, and not left to stand above three quarters of an hour, to be hopped and boiled at discretion.—If a double wort or ale, the two liquors resulting from the two first mashings, must be used as liquor for a third mashing of fresh malt.—

For fine ale, the liquor thus *brewed*, is further prepared with molasses.

Instead of yelt, some use castile soap, others flour and eggs, others an essential oil of barley: others a quintessence of malt, others of wine, and others the sal panaritum.

For the properties of the liquors thus *brewed*, see MALT liquor.

BRIBERY, in common law, is when a person in judicial places takes a gift or reward of any person who has business before him, for doing his office, or by colour of his office, except the king's, unless it be meat and drink.

BRICK, a kind of stonious stone, of a reddish colour*, made of a fatty earth, formed into long squares, four inches in breadth, and eight or nine in length, by means of a wooden mould; and then baked and burnt in a kiln, to serve for the uses of building.

* There are also bricks of a whitish colour. Wulpsit, in Suffolk, is famed for this sort.

Bricks appear to be of a very ancient standing; the tower of Babel, and the walls of Babylon being built thereof; as appears both from sacred history, and from the remains thereof still said to be in being. Under the first kings of Rome, they built with massive squared stones, which they learnt from the Tuscans: towards the latter time of the republic, they began to use brick; borrowing the practice from the Greeks; and the greatest, as well as the most durable buildings of the succeeding emperors, as the Pantheon, &c. were built therewith.—In the time of Gallienus the buildings were composed of a row of brick and a row of soft gritty stone, alternately. After him, they laid aside the use of bricks, and resumed that of flints.

In the east, they baked their bricks in the sun: the Romans used them crude; only leaving them to dry in the air a long space of time, viz. four or five years.

The bricks used by the Greeks were principally of three kinds; the first called *διδυχοι*, i. e. of two palms; the second *τετραδυχοι*, of four palms; and the third *πενταδυχοι*, of five palms.—They had other bricks, just half each of these, which they joined together to render their work more solid, as well as more agreeable to the eye, by the diversity of figures and sizes of the bricks.

Bricks, among us, acquire various names, according to their forms, dimensions, uses, method of making, place, &c. The principal are,—*Campas bricks*, of a circular form, used in steening of walls.—*Concave*, or *hollow bricks*, on one side flat, like a common brick, on the other hollowed: used for conveying water under ground.—*Cogging bricks*, used for making the indented work, under the coping of walls built with great bricks.—*Coping bricks*, formed on purpose for coping of walls.—*Dutch* or *Flemish bricks*, used to pave yards and stables, and for soap-boilers vats, and cisterns.—*Chinkers*, such bricks as are glazed by the heat of the fire in making.—*Feather-edged bricks*, are made like the common statute bricks, only thinner on one edge than on the other, and used to pen up the brick panels in timber buildings.—*Samel*, or *sandal bricks*, are such as lie outmost in a kiln or clamp, and consequently are soft and useless; as not being thoroughly burnt.—*Great bricks* are those which are twelve inches long, six broad, and three thick: the weight of one being about fifteen pounds: so that 100 weigh 1500, and 1000 of them 15000 pounds: their use is to build fence walls; together with,—*Pilaster*, or *butterfly bricks*, which are of the same dimensions with the great bricks, only they have a notch at one end, half the breadth of the brick: their use is to bind the work at the pilasters of fence-walls, which are built of great bricks.—*Paving bricks*, or *tyles*, are of several sizes in several counties and places. See **TYLE**, and **PAVEMENT**.—*Place bricks*, such as are made in a place prepared on purpose for them, near the building they are to be used in.—*Statute*, or *small common bricks*, when burnt, ought to be nine inches long, four and a quarter broad, and two and a half thick*. 100 of these usually weigh about 550 pounds, and 1000, 5500 pounds; about 407 in number, make a ton weight. These are commonly used in paving cellars, hearths, sinks, &c. Thirty or thirty-two, if true measure, will pave a yard square, and 330 will pave a square of 100 foot laid flat; but if laid edge-ways, there must be near double the number.—*Stock bricks* are to be of the same dimensions; only $\frac{1}{2}$ of an inch thicker.

* By 3 G. 2. c. 22. within 15 miles of London, they are to be $8\frac{1}{2}$ inches long, $4\frac{1}{2}$ broad, and $2\frac{1}{2}$ thick.

Barbaro, in his commentary on Vitruvius, recommends another form of bricks, viz. triangular ones, every side a foot long, and only an inch and half thick.—These, he observes, would have many conveniences above others; as being more commodious in the management, of less expence, and of fairer show; adding much beauty and strength to the mural angles, where they fall gracefully into an indented work.—Sir H. Wotton wonders they have never been taken into use, being recommended by so great an authority.

The earth whercof bricks are made must not be sandy, which will render them both heavy and brittle; nor must it

be too fat, which will make them crack in drying. They should be made either in the spring, or autumnal season; and when made, they must be sheltered from the sun if it be too hot, and yet be exposed to the air to dry.—If they be made in frosty weather, they are to be covered with sand; if in hot weather, with wet straw.—When they are well dried, they are to be burnt.

The burning of bricks is performed either in a kiln, or a clamp.—In the former, the bricks being set in, and the kiln covered with pieces of bricks, they put in wood, to dry them with a gentle fire; and this they continue till they are pretty dry, which is known by the smoke's turning from a whitish to a thin black smoke. They then cease to put in wood, and proceed to burn with brush, furze, straw, heath, brake, or fern faggots; having first dammed up the mouth of the kiln with a shinglog, i. e. pieces of bricks piled upon one another, and closed with wet brick-earth, instead of mortar: then they continue to put in more faggots, till the kiln and its arches look white, and the fire appear at-top of the kiln: upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slackening, till the ware be thoroughly burnt; which is usually effected in 48 hours.

About London, they chiefly burn in clamps, built of the bricks themselves, after the manner of arches in kilns; with a vacancy between each brick's breadth, for the fire to play through: but with this difference, that instead of arching, they truss or span it over, by making the bricks project one over another, on both sides of the place, for the wood and coals to lie in, till they meet and are bounded by the bricks at the top, which close all up. The place for the fuel is carried up straight on both sides, till about three foot high: then they fill it almost with wood, and over that lay a covering of sea-coal; and then over-span the arch: but they strew sea-coal also over the clamp, betwixt all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal: and when all is burnt out, they conclude the bricks sufficiently burnt.

By 12 G. 1. c. 35. earth or clay, designed for making bricks for sale, shall be dug, and turned at least once between the first of November, and the first of February, and not be made into bricks till after the first of March: and no bricks be made for sale but between the first of March and twenty-ninth of September.—And so spanish to be mixed with the earth, or breeze in the burning of bricks.—And all bricks are to be burnt either in kilns or distinct clamps, each sort by itself.

By 3 G. 2. c. 22. there may be mixed with the brick-earth any quantity of sea-coal ashes, sifted or screened through a sieve or sereen half an inch wide, and not exceeding twenty loads to the making one hundred thousand bricks: each load not exceeding thirty-six bushels.—And breeze may be mixed with coal in the burning of bricks in clamps for sale, &c.—Stock-bricks and place-bricks may be burnt in one and the same clamp, so as the stock-bricks be set in one distinct parcel, and not mixed or surrounded with place-bricks.

For the more effectual securing the observation of these laws, it was enacted, by 12 G. 1. c. 35. for the better discovering of offenders, that the master and wardens of the company of tylers and brick-layers should have power to search brick-kilns, &c. but they having permitted, and even encouraged divers persons to make bricks contrary to the directions in the said act; by 2 G. 2. c. 15. they are divested of that power; and any two, three, or more persons, appointed by the justices of peace, are empowered, within fifteen miles of London, to go, in the day-time, into any grounds, sheds, or places, where any clay, or earth shall be digged, or digging, for bricks or pantiles; or any bricks or pantiles shall be making, or made for sale; and there to view, search, and inspect the same, &c.—Offenders to forfeit twenty shillings for every thousand of unlawful bricks, and 10s. for every thousand of such tiles: one moiety to the use of the prosecutor, the other to the poor of the parish where the offence shall be committed.

Goldman observes, that bricks will have double the strength, if, after one burning, they be steeped in water, and burnt afresh. If the brick-earth be too fat, it must be tempered with sand; and that trodden out again, first by cattle, then by men. Bricks made of common earth, melt, nay vitrify, by too much heat: for which reason, the kilns are made of stones that will themselves calcine, that the vehemence of the fire may be broken by them: besides which, they usually place other bricks, made of an argillous earth, which will melt, next the fire.

BRICK-WALLS. } See the articles { **WALL.**
Flemish-Bricks. } **FLEMISH.**

Oil of Bricks is oil of olives, imbibed by the substance of bricks, and afterwards distilled from it.—The pieces of brick being heated red-hot in live-coals, are extinguished in a trough half filled with oil of olives: being then separated, and the brick thus saturated with oil, and grossly pounded, it is put into a retort, and placed in a reverberatory furnace; and thus is drawn an oil, which the apothecaries call *oleum de lateribus*, and some chymists oil of the philosophers: it is used for resolving tumours

tumours in the spleen, also against palsies, epilepsies, &c.
See OIL.

BRICK-LAYER. See TYLER.

BRIDGE, an edifice either of stone or timber, consisting of one or more arches erected over a river, canal, or the like, for the convenience of crossing, or passing over from one side to the other.

A bridge may be considered as a road over water. See ROAD. Janus is made, by some learned men, the first inventor of bridges, as well as of ships, and crowns: their reason is, that in several ancient Greek, Sicilian, and Italian coins, there are represented on one side a Janus, with two faces, and on the other, a bridge, or a crown, or a ship.

The parts of a bridge are the piers, or legs, *pila*; the arches; the pavement, or way over for cattle and carriages; the foot-banks on each side for foot-passengers; the rail or parapet, which incloses the whole; and the buttments, or ends of the bridge on the banks.

Bridges are a sort of edifices very difficult to execute, on account of the inconvenience of laying foundations, and walling under water. The earliest rules and instructions relating to the building of bridges are given by Leon Baptista Alberti, *Archit.* l. 8. Others were afterwards laid down by Palladio, l. 3. Serlio, l. 3. c. 4. and Scamozzi, l. 5. all of which are collected by M. Blondel, *Cours d'Archit.* p. 5. l. 1. p. 629. seq. The best of them are also given by Goldsmid, *Baukunst*, l. 4. c. 4. p. 134. and Hawkmoor, *Hist. Lond. Bridge*, p. 26, seq. M. Gautier has a piece expressive on bridges, ancient and modern. *Trait. des Ponts*. Paris 1716. 12^e.

The conditions required in bridges are, that they be well-designed, commodious, durable, and suitably decorated.—The piers of stone-bridges are to be equal in number, that there may be one arch in the middle, where commonly the current is strongest. Their thickness is not to be less than a sixth part of the span of the arch, nor more than a fourth. They are commonly guarded in front with an angular starling or spur, to break the force of the current; though this defence is sometimes also turned semicircularly: in the ancient bridges, it is always a right angle; which has the advantage of being stronger and more durable than acute ones. The strongest arches are those whose sweep is a whole semicircle.—For the rails, the height, ornaments, and the like, they are left to discretion.—It is even complained, that no demonstrative reasons are given of the several proportions of the most essential parts of bridges: much of which is left to the discretion of the builder, to be regulated according to the circumstances, design, place, magnitude, &c. of the designed edifice. M. Gautier wishes, that mathematical persons would take the structure and proportions of bridges into their consideration, in order to bring things to more certainty and precision, founded on unvariable geometrical truth. Something of which kind has been attempted by M. de la Hire, in *Mém. Acad. R. Scienc.* an. 1712. p. 70. and the Marquis de l'Hopital, in *Art. Erud. Lips.* 1695. p. 56.

The breadth of a bridge, according to Baptista Alberti, ought to be the same as that of the highway which abuts on it: the breadth of the piers is to be one third of the aperture of the arches; the starlings to be one half the breadth of the piers, and to rise above the greatest height to which the water ever mounts.

In the bridges of Avignon, St. Esprit, and Lyons, there is this remarkable, that they are not straight, especially the two former, but bent, having an angle, whose convexity is turned towards the stream, to break the force thereof: the pont St. Esprit, Dr. Robinson observes, is bowed in many places, making unequal angles, especially in those parts where the stream is strongest. The great pier in the middle of London-bridge, as we are told, was intended to serve for a steady to the whole machine, instead of making an angle, as in the above-mentioned bridges.

The famous bridge of Venice, called the *Rialto*, consists but of a single arch, and that a flat or low one; passing for a master-piece of art; being built in 1591, on the design of Michael Angelo: the span of the arch is ninety-eight feet one half, and its height above the water only twenty-three feet.—Poulet also mentions a bridge, of a single arch, in the city Munster in Bothnia, much bolder than that of the Rialto at Venice. But those are nothing to a bridge in China, built from one mountain to another, consisting of one single arch 400 cubits long, and 500 cubits high, whence it is called the *flying bridge*: a figure of it is given in the *Philosophical Transactions*. Kircher also speaks of a bridge in the same country 360 perches long, without any arch; supported only by 300 pillars.

To secure the piers of bridges, they sometimes diminish the current of the river, either by lengthening its course, by making it more winding (a method sometimes used by the ancients in rendering their rivers navigable) or by stopping the bottom of a rapid river, with rows of banks, flakes, or piles, which break the current.

The piers of a bridge always diminish the bed of a river: suppose this diminution one fifth, it will follow, that in case of inundations, the bed must be sunk or hollowed one fifth more

than before, since the waters gain in depth what they have lost in breadth. Add, that as the quantity of the water remains still the same, it will pass with greater velocity by one fifth in the place where such contraction is: all which conduces to wash away the foundation. The stream, thus augmented in velocity, will carry away flints and stones, which before it could not stir.

The foundations of bridges are to be laid at the season of the year when the waters are lowest, as in autumn; and if the ground be rocky, hard gravel, or stony, the first stones of the foundation may be laid on the surface, without digging deeper; but if the soil be soft sand, or gravel, it will be necessary to turn off the water, and dig till you come at a firm bottom; at least, if this cannot be done, part of the water must be carried off, and the rest kept dry, and piled: that side of the river where you are to work is to be inclosed with coffer-dams, and the currents to have its liberty on the other side. Palladio's directions are, first, to make choice of that place in a river which has the least depth of water, and where the ground is even and firm, especially rock or gravel stone; secondly, to avoid those places where there are vorages, or whirlpools, and where the bottom is soft sand or gravel, in regard such matters are easily carried away by the violence of water, which in time alters the bed of a river, and saps the foundation of the piers; thirdly, to pitch on a straight part of a river, since otherwise the turns and windings being worn away in time, the bridge is in danger of being left insulate; besides being liable to be choaked up with the filth and other matters commonly gathered in the turns of rivers.

BRIDGES are either built of stone, or timber, according as there is a conveniency, or plenty of the one material or the other in the place.

Stone-BRIDGES are composed of piers, arches, and buttments, made of hewn stone, sometimes also intermixed with brick; as, the bridge of Tholouse, the plinths whereof are of stone, as also the quoins of the arches, and some bonding courses, and copings; but the rest, as the arches, walls, and buttments, of brick.

Wooden-BRIDGES, called by the Latins, *pontes subicii*, consist of beams and joists sustained by punchions, well cramped and bound together.

Sturmius has a dissertation expressive on the structure of a wooden-bridge: *Disq. de Ponte Subicio*. Francof. 1709.

Ruſſen-BRIDGE, *pont de jonc*, is made of large heaves of rushes growing in marshy grounds, which they cover over with boards or planks. They serve for crossing ground, that is boggy, miry, or rotten.

The Romans had also a sort of subitaneous bridges made by the soldiers, of boats, or sometimes of casks, leathern bottles or bags, or even of bullocks-bladders blown up, and fastened together, called *ascosefri*. *Plin. l. Ant. T. 2. p. 464. seq. voc. Pontes*. Du Cange *Gloss. Lat. T. 1. p. 350*. M. Couplet gives the structure of a portable bridge, 200 foot long, easily taken asunder and put together again, and which forty men may carry.—*Vid. Du Hamel Hist. Reg. Acad. Scienc. l. 3. sect. 5. c. 4. p. 273*.

Frezier speaks of a wonderful kind of bridge at Apurima in Lima, made of ropes, formed of the bark of a tree.—*Vid. Frez. Voyag. South-Sea, p. 184*.

Pendent or Hanging BRIDGES, called also *Philosophical BRIDGES*, are those not supported either by posts or pillars, but hung at large in the air, only sustained at the two ends, or buttments.—Instances of such bridges are given by Palladio, and others.—*Vid. Vogels Modern. Bau-Kunst. Tab. 26. seq. Wolf. L. Math. p. 277. voc. Brucke. Kirch. Mund. Subterr. l. 1. c. 3. T. 1. p. 14*.

Dr. Wallis gives the design of a timber-bridge, seventy foot long, without any pillars, which may be useful in some places where pillars cannot conveniently be erected. *Phil. Trans. N^o 163. p. 714*. Dr. Plot assures us, that there was formerly a large bridge over the cattle-ditch at Tutbury in Staffordshire, made of pieces of timber none much above a yard long, and yet not supported underneath, either with pillars, or arch-work, or any other sort of prop whatever.—*Vid. Plot. Nat. Hist. Stafford. c. 9. §. 88. p. 383*.

Draw-BRIDGE, *Pons subduſtarius*, is such a one as is made fast only at one end, with hinges; so that the other end may be lifted up; in which case the bridge stands upright, to hinder the passage of a moat, or the like.

There are others made to draw back, to hinder the passage, and to thrust over again to afford a passage. And others, which open in the middle; half of which turns away to one side, and the other half to the other; being joined again at pleasure: but these have this inconvenience, that one half of them remains on the enemy's side.

The Marquis de l'Hopital has given the construction of a curve, in which a weight will always be a counter-balance to a draw-bridge; which the younger Bernoulli has shewn to be no other than the cycloid.—*Vid. Art. Erud. Lips. an. 1695. p. 56. seq.*

Flying-BRIDGE, *Pont volant*, or *Pons duſtarius*, an appellation given to a bridge made of pontoons, leathern boats, hollow beams,

beams, casks, or the like, laid on a river, and covered with planks for the passage of an army.

Flying BRIDGE, *Pont volant*, more particularly denotes a *bridge* composed of one or two boats joined together, by a sort of flooring, and surrounded with a rail or ballustrade; having also one or more masts, to which is fastened a cable, supported at proper distances by boats, and extended to an anchor, to which the other end is fastened, in the middle of the water. By which contrivance, the *bridge* becomes moveable, like a pendulum, from one side of the river to the other, without other help than the rudder.—Such *bridges* sometimes also consist of two *flories*, for the quicker passage of a great number of men; or that both infantry and cavalry may pass at the same time.—Davi.

Flying or Floating-BRIDGE is ordinarily made of two small *bridges*, laid one over the other, in such manner, as that the uppermost stretches and runs out, by the help of certain cords running through pulleys placed along the sides of the under-*bridge*, which push it forwards till the end of it joins the place it is designed to be fixt on.

When these two *bridges* are stretched out at their full length, so that the two middle ends meet, they are not to be above four or five fathoms long, because if longer they will break.

Their chief use is for surprizing out-works, or posts that have but narrow moats.

In the memoirs of the royal academy of sciences, we find a new contrivance of a *floating-bridge*, which lays itself on the other side of the river.—*Vid. Hist. Acad. R. Scienc. an. 1713. p. 104.*

BRIDGE of Communication is a bridge made over a river; by which two armies or forts, separated by the river, have a free communication with one another.

BRIDGES of Boats are either made of copper, or wooden boats fastened with stakes, or anchors; and laid over with planks.

One of the most notable exploits of Julius Cæsar, was the expeditious making a *bridge* of boats over the Rhine: Modern armies carry copper boats, called *pontoons*, to be in readiness for the making *bridges*: several of these being joined side by side, till they reach a-cross the river, and planks laid over them, make all plain for the men to march on.

There are fine *bridges* of boats at Beaucaire, and Rouen which rise and fall with the water; and that at Seville is said to exceed them both.

The *bridge* of boats at Rouen, built in lieu of the stately stone-*bridge* erected there by the Romans, is represented by a modern writer, as the wonder of the present age; it always floats; and rises, and falls with the tide, or as land-waters fill the river; it is near 300 yards long, and is paved with stone just as the streets are: carriages with the greatest burdens go over it with ease, and men and horses with safety, though there are no rails on either hand. The boats are very firm, and well moored with strong chains; and the whole well looked to, and constantly repaired, though now very old.

BRIDLE, of an horse, is an assemblage of various members or parts; as the *bit*, or *snaffle*; the *head-stall* or leathers from the top of the head to the rings of the bit; the *fillet*, over the forehead, and under the foretop; *throat-band*, which buttons from the head-band under the throat; *reins*, the part held in the hand; *nose-band*, going through loops at the back of the head-stall, and buckled under the cheeks: to which add the *tranche*, the *cavezan*, *martingal*, and *chaff balter*.

BRIEF, *BREVE*, in common law, a writ whereby a man is summoned or attached to answer any action: or more largely, it is taken for a writing issued out of any of the king's courts of record at Westminster, whereby something is commanded to be done in order to justice, or the execution of the king's command.

It is called *brief*, *breve*, *quia breviter intentionem proferantis exponit*; because couched in a few plain words, without preamble, &c.

BRIEF is also used for a letter patent, granting a licence to a subject, to make a collection for any public or private loss.

Apostolical BRIEFS denote letters which the pope dispatches to princes, and other magistrates, touching any public affair.

They are thus called, as being very concise, and written on paper, without preface or preamble; by which they are distinguished from *bulls*, which are more ample, and always wrote on parchment, and sealed with lead or green wax; whereas *briefs* are sealed with red wax, and with the seal of the fisherman, or St. Peter in a boat; a seal never applied but in the pope's presence.

The *brief* is headed with the name of the pope, apart; and commences with *Dilecto filio salutem, & apostolicam benedictionem*, &c. after which he proceeds directly to the matter in hand, without further preamble.

Briefs are not subscribed by the pope, nor with his name, but with that of his secretary. Pope Alexander VI. instituted a college of secretaries for *briefs*; since which time, they have been made much longer and more ample than before. See **BREVIATOR**.

Formerly *briefs* were only dispatched about affairs of justice; but now they are likewise used in matters of benefices, expectative graces, and dispensations.

BRIGADE*, in the military art, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.

* The word is French; some derive it from the Latin *briga*, a *brigue*, or secret intrigue: Du Cange fetches it from *brigand*, an ill-disciplined soldier, who scour the country, and plunderers it of every thing, without waiting for the enemy: as the armies of Arabs, Tartars, &c. The origin of *brigand* is again deduced from *brigandine*, a sort of armour used in the army raised by the Parisians, during the captivity of their king John in England, notorious for their robberies.

There are two sorts of *brigades*, according to the French way of accounting: 1^o. A *brigade of an army*, which is a body of horse of ten or twelve squadrons: or of foot, of five or six battalions.—And in this way, an army is sometimes divided into eight *brigades*; four of horse, and four of foot.

2^o. A *brigade of a troop of guards* which is a third part thereof, when the troop consists of fifty soldiers; but only a sixth when it consists of 100; that is, in the former case, the troop is divided into three *brigades*, in the latter into six.

BRIGADE-Major, or *Major of a BRIGADE*, is an officer appointed by the brigadier to assist him in the management and ordering his *brigade*; in which he acts as a major-general does in an army. See **MAJOR**.

BRIGADIER General, an officer that commands a *brigade* of horse or foot in an army.

The *brigadier* is an officer of importance; being the next in order below a major-general, or, in the French army, to the marshal de camp.

BRIGANDINE, a coat of mail; a kind of ancient defensive armour, consisting of thin jointed scales or plates, pliant and easy to the body.

Some confound it with *habergeon*; and others with *brigantine*, a low long vessel. See **HABERGEON**.

BRIGANTINE, a small, light, flat, open vessel, which goes both with sails and oars, and is either for fighting or giving chase.

It has usually twelve or fifteen benches on a side for the rowers, a man and an oar to each bench. *Brigantines* are principally used by the Corsairs, all the hands aboard being soldiers, and each having his musket ready under his car.

BRILLIANT diamonds. See **DIAMOND**.

BRIMSTONE. See the article **SULPHUR**.

Flower of BRIMSTONE. See the article **FLOWER**.

BRINE, water replete with saline particles. See the article **SALT**.

By 1 A. c. 21, are prohibited.—*Brins* taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish, without boiling the same into salt.—and rock-salt, without refining it into white-salt.

BRINGERS-UP, in a battalion, are the whole last rank of men in it, or the hindmost man in every file. See **FILE**.

BROAD. See **PRECE**.

BROCADE, in commerce, a sort of stuff, or cloth of gold, silver, or silk, raised and enriched with flowers, foliages, or other figures, according to the fancy of the manufacturer. Formerly, the term was restrained to cloths wove either wholly of gold, both wool and warp, or of silver, or of both together: but by degrees it came likewise to pass for such as had silk intermixed, to fill up, and terminate the flowers of gold and silver.

At present, any stuff of silk, satin, or even simple taffety, when wrought, and enriched with flowers, &c. obtains the denomination of *brocade*.

BROKEN numbers. See **NUMBER**, and **FRACTION**.

BROKERS are of three kinds; *exchange-brokers*, *stock-brokers*, and *pawn-brokers*.

Exchange-BROKERS are a sort of negotiators, who contrive, make, and conclude bargains between merchants and traders, in matters of money or merchandise, for which they have a fee, or premium. See **EXCHANGE**.

These, in our old law-books, are called *broggers*, and in Scotland, *broccarii*, i. e. according to Skene, mediators or intercessors in any contract, &c. See **PROXIMETA**.

They make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for negotiating the exchange with; and when the matter is accomplished, that is, when the money is paid, they have for brokerage two shillings per 100 pounds sterling.

In France, till the middle of the seventeenth century, their *exchange brokers* were called *courtiers de change*; but by an arret of council in 1639, the name was changed for that more creditable one of *agent de change, banque, & finance*: and in the beginning of the eighteenth century, to render the office still more honourable, the title of *king's counsellors* was added.

At Grand Cairo, and several places of the Levant, the Arabs, who

who do the office of *exchange-brokers*, are called *consuls*: the manner of whose negotiating with the European merchants has something in it so very particular, that we have referred it to a distinct article.

The *exchange-brokers* at Amsterdam, called *makelaers*, are of two kinds; the one like the English, called *sworn brokers*, because of the oath they take before the *burgemeesters*; but the others negotiate without any commission, and are called *walking brokers*.—The first are in number 395; whereof 375 are Christians, and 20 Jews: the others are near double that number: so that in Amsterdam there are near 1000 *exchange-brokers*.—The difference between the two consists in this; that the books and persons of the former are allowed as evidence in the courts of justice; whereas, in case of dispute, the latter are disowned, and their bargains disannulled.

The fee of the *sworn exchange-brokers* of Amsterdam is fixed by two regulations, of 1613, and 1623, with regard to matters of exchange, to eighteen fols for 100 livres de gros, or 600 florins; i. e. three fols for 100 florins; payable, half by the drawer, and half by the person who pays the money. But custom has made considerable alterations herein.

In the east, all affairs are transacted by a sort of *brokers*, whom the Persians call *delah*, i. e. great talkers. The manner of making their markets is very singular: after the *brokers* have launched out into long, and usually impertinent discourses; coming towards a conclusion, they only converse with their fingers. The buyer and seller's *brokers*, each take the other by the right hand, which they cover with their coat, or a handkerchief: the finger stretched out, stands for fix; bent, for five; the tip of the finger for one; the whole hand for 100; and the hand clenched, for 1000. They will express even pounds, shillings, and pence by their hands. During all this mystic commerce, the two *brokers* appear as cold and composed, as if there were nothing passing between them.

Stack-BROKERS are those employed to buy and sell shares in the joint stock of a company or corporation. See COMPANY, SUBSCRIPTION, and AGENT.

Pawn-BROKERS are persons who keep shops, and let out money to necessitous people upon pledges, for the most part on usurious conditions.

There are more properly called *pawn-takers*, or *talley-men*, sometimes *fripers* or *fripierers*.

Of these is to be understood the statute of 1 Jac. I. c. 21: by which it is enacted, That the sale of goods, wrongfully gotten, to any *broker* in London, Westminster, Southwark, or within two Miles of London; shall not alter the property thereof.—If a *broker*, having received such goods, shall not, upon the request of the right owner, truly discover them, how and when he came by them, and to whom they are conveyed; he shall forfeit the double value thereof to the said owner. In the cities of Italy, there are companies established by authority, for the letting out money on pawns; called *mounts of piety*: an honourable title, like that of *charitable corporation*, but little becoming such institutions; inasmuch as the loan is not *gratis*.

In some parts of Italy, they have likewise *mounts of piety* of another kind, wherein they only receive ready money, and return it again with interest at so much per annum.—At Bologna they have several such *mounts*; which are distinguished into *Frank* and *perpetual*: the interest of the former is only four per cent. in the latter, seven.

BRONCHIA*, in anatomy, the little tubes into which the trachea is branched, at its entrance into the lungs; and which are distributed through every part thereof, serving for the conveyance of the air in respiration.

* The word is Greek, *βρογχια*, where it signifies the fame. See TRACHEA, LUNGS, and RESPIRATION.

The *bronchia* consist of cartilages like the trachea; only here the cartilages are perfectly circular, without any membranous hard part: they are joined together by the membranes that invest them, and are capable of being shot out lengthwise in inspiration; and of being drawn into each other in expiration.

BRONCHIAL artery is an artery of the lungs, which arises from the descending trunk of the aorta, or intercostals; and, embracing the trachea, pursues the course of the bronchia, accompanying all the branches thereof through their whole progress. See Tab. Anat. (Angeiol.) fig. 1. n. 20.

BRONCHIAL vein arises from the intercostals, or the azygos, accompanies the artery, and divides into the same number of branches with it.

The artery brings blood to the bronchia, for the nutrition thereof, and of the vessels of the lungs; and the vein carries it off again to the cava, where it soon terminates.

The *bronchial artery* is sometimes single; but more frequently double; sometimes triple.

BRONCHOCLE*, a pendant tumour, or poke, with a large round neck, rising on the bronchial part of the trachea, very frequent in the Alps.

* The word is Greek, formed from *βρογχος*, *bronchus*, wind-pipe; and *κλον*, swelling.

VOL. I.

BRONCHOTOMY*, in chirurgery, the operation of cutting into the windpipe, to prevent suffocation in a quinsy; or an incision made in the trachea or wind-pipe between two of its annuli or rings, in order to give passage to the breath, when there is danger of suffocation, from an inflammation of the larynx, &c.

* The word comes from the Greek *βρογχος*, wind-pipe; and *τομή*, *seco*, I cut.

Bronchotomy, called also *Laryngotomy*, is thus performed.—The body of the patient being prepared, an incision is made between the third and fourth annuli, or rings of the aspera arteria, an inch below the bottom of the larynx; the skin and integuments divided, and the muscles removed; a silver tube is applied, and the cause of the disease removed; and the wound healed; nourishment being applied in the mean time, if debilitation be impracticable.

Dr. Musgrave observes, that in all medicine there is not one method that works so great a change, for the better, in so short a time.—However, it is seldom practised, in regard that gap which appears on the cutting a throat, (the divided parts being then drawn towards their more fixed ends) together with the great efflux of blood when the jugulars and carotid arteries are also wounded, create in most men a dread of the operation, and make many believe all wounds of the trachea mortal.—The same author makes no scruple however to say it ought to be practised in quinsies, and other diseases of suffocation from causes of a like nature; and that he has seen an extraordinary cure which he himself wrought in this way.

BROOD*, the young of fowl, and fowls.

* The word is derived from the Saxon *brædan*, to breed; which alludes to *βρεω*, to be warm, and *ωω*, an egg.

Brood of fish is a school, or shoal, in fresh waters, where it may have rest to recruit, and grow to perfection. And here it is often destroyed by weirs, draw-nets, and nets with canvas, or like engines in the bottoms of them; in harbours, havens, and creeks.—Every year near the main sea takes, in twelve hours, sometimes five buhels, sometimes ten, sometimes twenty or thirty.—None for the future to fish within five miles of the mouth of any harbour or creek, with any draw-net or drag-net, under three inches mesh, viz. an inch and half from knot to knot, except for the taking of smoulds in Norfolk only.—3 Jac. I. c. 12.

For the preventing hereof, by 3 Jac. I. c. 12, it is also enacted, That none shall erect a wear, or weirs, along the sea-shore, or in any haven, or creek, or within five miles of the mouth of any haven, or creek; or shall willingly destroy the spawn, or fry of fish; on pain of 10*l.* to be divided betwixt the king and the prosecutor. Neither shall any one fish in any of the said places, with any net of a less mesh than three inches and an half betwixt knot and knot (except for the taking of smoulds in Norfolk only), or with a canvas net, or other engine, whereby the spawn or fry of fish may be destroyed; on pain to forfeit the said engine or net, and 10*l.* in money, to be divided betwixt the poor of the parish, and the prosecutor.

BROOMING, or **BREAMING** of a ship, the breaming off the filth she has contracted on her hulls, with straw, reed, broom, or the like, when she is on a green, or on the ground. See CAREENING.

BROTHER*, *Frater*, a term of relation between two male children, sprung from the same father, or mother, or both.

* Scaliger and Vossius derive *frater* from *φραγγω*, for *φρατς*, which properly signifies a person who draws water in the same well; *φραγς*, in Greek, signifying well, and *φρατς*, a company of people, who have a right to draw water out of the same well.—The word, it is said, came originally from the city Argos, where there were only one well, and the neighbourhood alone repaired.

The ancients applied the term *brother* indifferently to almost all who stood related in the collateral line, as uncles, and nephews, cousins-german, &c.—This we learn not only from a great many passages in the old testament; but also from profane authors: Cicero, in his *Philippics*, says, “*Antonia* was both wife and sister of Mark Anthony; because she was daughter of his brother C. Antonius.” Ammianus Martellus, Tullus Hostilius, in Dionysius Halicarnassensis, call the Hetratii and Curatii, *brothers*; because they were their children.

* The language of the Jews, bishop Barrow observes, is full in the name of *brother*, and the word *brother* is used in the bible, but also the language of the Greeks, who use the word *φρατς*, as Abraham to Lot, and Jacob to his brothers, &c.—So Jacob told his sons, Gen. xxx. 12, “*brother*,” and so on. The word *brother* is also used in the language of the Persians, who call their children *brothers*, and so on. The word *brother* is also used in the language of the Persians, who call their children *brothers*, and so on.

Among us, it is customary to call the children of the same father to each other; the word *brother* is also used in the language of the Persians, who call their children *brothers*, and so on. Menander mentions a letter from Persia, to the effect, “*brother*,” &c.

emperor Justinian, beginning thus : Cosroes king of kings, &c. to the emperor Justinian my brother.

Kings now also give the same appellation to the electors of the empire : and the like was given by the king of France to the present king of Sardinia, while only duke of Savoy.

In the civil law, *brothers*, *fratres*, in the plural, sometimes comprehends sisters ; as *Lucius & Titia, fratres*, l. 38. D. de famil. *Tres fratres, Titius, Mævius, & Seia*, l. 35. D. de pactis.

BROTHERS German, *fratres Germani*. See GERMAN.

BROTHER is more particularly used to denote the relation between monks of the same convent.

In which sense they say, *brother Zachary, brother Bonaventure, &c.* In English, we more usually say *friar Zachary, &c.* from the French word *frere, brother*.

This appellation is borrowed from the primitive Christians, who all called each other *brothers* : but it is principally used for such of the religious as are not priests ; those in orders are generally honoured with the title of *fathers, patres, peres* ; whereas the rest are only simply *brothers*.

The monks of St. Dominic are particularly called *preaching brothers*, or, *fratres predicatorum* : those of St. Francis, *minor brothers*, those of charity, *ignorant brothers*, &c.

Lay-BROTHERS. See the article LAY.

In the military orders, the knights are also called *brothers*.—In the order of Malta, there is a particular class, who are called *servant brothers* ; consisting of such as cannot give proof of their nobility. In Latin they are denominated *fratres clientis*. See MALTA.

BROTHERS by adoption. See the article ADOPTION.

Two *brothers*, who have only the same father, are called *fratres consanguinei* : and those who are only descended from the same mother, *fratres uterini*.

BROTHERS of the rosy-cross. See ROSICRUCIAN.

Sworn BROTHERS, *fratres conjurati*. See FRATRES.

BROTHERHOOD. See the article FRATERNITY.

BROWN Sugar. See the article SUGAR.

BROWNISTS, a religious sect, which sprung out of the Puritans, towards the close of the sixteenth century ; their leader, Robert Brown *.

* Robert Brown, who put himself at the head of this sect, and wrote divers books in their behalf, was a man of good parts, and some learning. He was born of a good family in Rutlandshire, and related to the lord treasurer Barleigh. He had been educated at Cambridge ; but first published his notions, and began to inveigh openly against the discipline and ceremonies of the church, at Norwich, in the year 1580, from which time he underwent divers persecutions from the bishops ; in so much that he boasted he had been committed to no less than thirty-two prisons, in some of which he could not see his hand at noon-day. At length, with his congregation, he left the kingdom, and settled at Middleburgh in Zealand ; where they obtained leave of the States to worship God in their own way, and form a church according to their own model. Which they had not long done, ere this handful of men, just delivered from the severities of the bishops, began to differ among themselves, and crumble into so many parties, that Brown, their pastor, grew weary of his office ; and, returning to England in 1589, renounced his principles of separation ; and was preferred to the rectory of a church in Northamptonshire ; and died in 1630.

The revolt of Brown was attended with the dissolution of the church at Middleburgh, but the seeds of *Brownism*, which he had sown in England, were so far from being destroyed, that Sir Walter Raleigh, in a speech in 1592, computes no less than twenty thousand followers of it.

The occasion of their separation was not any fault they found with the faith, but only with the discipline and form of government of the other churches in England. They equally charged corruption on the episcopal form ; and on that of the Presbyterians, by consistories, classes, and synods : nor would they join with any other reformed church ; because they were not assured of the sanctity and regeneration of the members that composed it ; on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church ; maintaining, that matrimony being a political contract, the confirmation thereof ought to come from the civil magistrate. They would not allow any children to be baptized of such as were not members of the church, or of such as did not take sufficient care of those baptized before. They rejected all forms of prayer ; and held that the lord's prayer was not to be recited as a prayer ; being only given for a rule or model, whereon all our prayers are to be formed.

The form of church-government which they established was democratical. When a church was to be gathered, such as desired to be members of it made a confession of it ; and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church-officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by fasting, prayer and imposition of hands of some of the brethren. But they did not allow the priesthood

to be any distinct order, or to give any indelible character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word, and administer the sacraments among them ; so the same power could discharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what could meet together in one place, and join in one communion ; so the power of these officers was prescribed within the same limits. The minister or pastor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of prophesying, or of giving a word of exhortation to the people ; and it was usual for some of them, after sermon to ask questions, and reason upon the doctrines that had been preached. In a word, every church, on the *Brownists* model, is a body corporate, having full power to do every thing which the good of the society requires, without being accountable to any classis, synod, convocation, or other jurisdiction whatever. Most of their discipline has been adopted by the Independents, a party which afterwards arose from among the *Brownists*.

The laws were executed with great severity on the *Brownists* ; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them were hanged. The ecclesiastical commission, and the star-chamber, in fine, distressed them to such a degree, that they resolved to quit their country. Accordingly many families retired and settled at Amsterdam, where they formed a church, and chose Mr. Johnson their pastor ; and after him Mr. Aynworth, author of the learned commentary on the Pentateuch. Their church flourished near an hundred years. See *Neal Hist. of New Eng.* T. 1. c. 2. p. 58.

BRUARIA, turbaria. See the article TURBARY.

BRUMALIA *, or **BROMALIA**, a feast of Bacchus, celebrated among the ancient Romans, during the space of thirty days ; commencing on the twenty-fourth of November, and ending the twenty-sixth of December.

* The word comes from *bruma*, the day of the winter solstice ; in regard of the time when the feast was held : though others derive it from *brumus*, or *broniis*, names of Bacchus.

The *brumalia* were instituted by Romulus, who used during this time to entertain the senate.

BRYONY, WHITE, a medicinal root, anciently much used as a powerful purgative, especially of ferocities ; but now chiefly retained as a uterine detergent ; in which quality it enters the composition of an official water denominated from it *acqua bryonice*, generally prescribed against hysterical disorders.

M. Boukduc found, by a chymical analysis, that *bryony* consists only of saline principles, without any resin : wherein it differs from *mechoacan*, which, in other respects, it much resembles. He adds, that it has more virtue taken in substance than in any other manner ; which is common to this, with most other purgatives. The black *bryony* is a diuretick. See SUPPLEMENT, article BRYONIA.

BUBBLES, BULLE, in physics, little round drops or vesicles of any fluid filled with air, and formed either on its surface, upon the addition of more of the fluid, as in raining ; or in its substance, upon a vigorous intestine commotion of its parts.

Bubbles are dilatate or compressible, i. e. they take up more or less room, as the included air is more or less heated, or more or less pressed from without ; and are round, because the included aura acts equally from within all around. Their coat or cover is formed of the minute particles of the fluid, retained either by the velocity of the air, or by the brisk attraction between those minute parts and the air.

It is these little *bubbles*, rising up from fluids, or hanging on their surface, which form the white skum a-top ; and it is these same *bubbles* which form the steam or vapour flying up from liquors in boiling, &c. the manner of which see under **BOILING, VAPOUR**, &c.

BUBBLE, in commerce, is a cant-name, lately given to a sort of projects, for the raising of money on imaginary grounds ; very frequent in the years 1720,—21.

The pretended design of these undertakings was, to raise a stock, for the retrieving, setting on foot, or carrying on some promising and useful branch of trade, manufacture, machinery, or the like. In order to which, proposals were given out, shewing the advantages of the design, and inviting persons into it. The sum necessary to carry on the affair, together with the profits expected from it, were divided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein.—The real design, in some, was to raise a sum for the private advantage of the projectors ; to be laid out by them in South-sea stock, &c. in hopes, by the rise thereof, to be able to refund the subscribers money, with profit to themselves. In others, the design was absolutely to defraud the adventurers of their subscription-money, without any view to restitution.

There was a third kind somewhat different : the projectors of these, to proceed the more securely, proposed to have books opened, and subscriptions taken at some time to come ; and in the mean time took money, by way of premium, to en-

title persons to be admitted subscribers, as soon as the affair should be ripe for dividing into shares. Several thousand shares were, thus, very frequently bestowed in one day; and premiums, from one shilling to some pounds, paid thereupon, to the profits of the projectors.

The number of *bubbles*, and their qualities, were very extraordinary: some of them too authorized by patents; and in others, the projectors and their proprietors formed into corporations: some for fisheries, some for insurances, some for the digging of mines, &c. Posterity, doubtless, will be surprised to hear of *bubbles* for cleaning the streets, others for furnishing shoes, others for stockings, others for physic, others for the maintenance of bastard children, others for the buying bad titles, others for the lending of money, &c.

BUBBLING-Waters. See the article **WATER**.

BUBO*, in medicine and surgery, denotes a tumour, sometimes inflammatory, and sometimes scirrhous, gathering chiefly in the glands of the inguen, or groin.

* The word comes from the Greek *βουβων*, *inguen*; the usual place of such tumours.

There are two kinds of *bubos**, the one called *benign*, or mild, the other *malignant*.—Malignant *bubos** are divided into *pestilential* and *venereal*: the former arise in pestilential fevers, &c. The latter are the product of impure embraces; and frequently the forerunner of the pox.—When a *bubo* is encompassed with a circle of several colours, it is a sign it is pestilential, and it is generally mortal.

BUBONOCLE*, a tumour in the groin; occasioned by the descent either of the epiploon, or the intestines, through the perforation of the muscular oblique descender.

* The word comes from the Greek *βουβων*, *inguen*, and *κλην*, *tumor*.

The *bubonocle* is the same with what is otherwise also called *ramex* and *hernia inguinalis*. See **HERNIA**.

It is a species of rupture; though chirurgians call it an *incomplete* one; and is common to women as well as men.

BUCALLES Glandulæ are small glands dispersed over the inner side of the cheeks and lips, which separate a spittle useful in mastication, and digestion.

BUCANEERS, or **BUCANEERS**, a term frequent in the West-Indies, properly used for a kind of savages, who prepare their meat on a grate, or hurdle made of Brazil wood, placed in the smoke, at a good height from the fire, and called *buccan*.

Whence also the little lodges raised for the preparation of their food are called *buccans*; and the action of dressing it *buccaning*.

Meat *buccaned* is said to have an excellent taste, the vermillion colour of a rose, and a charming smell; all which it retains many months. Oexmelin, from whom we have this, adds, that the neighbouring people send their sick hither, that by eating their *buccaned* meat they may be recovered.

The origin of the word is referred to the people of the Caribbee Islands, who used to cut their prisoners of war in pieces, and lay them on hurdles with fire underneath; which they called *buccaning*, i. e. roasting and smoking together: hence our *buccaneers* took both their name and their custom; with this difference, that what the former did to men, these did to animals caught in hunting.

The Spaniards, Savary tells us, call the *buccaneers* in their territories *matadores*, that is, *killers*, and *monsters*, that is, *hunters*; the English call theirs, *cow-killers*.

The *buccaneers* are of two distinct professions; the one only hunt bulls for their skins, the other beasts for their flesh.

The art of *buccaning*, Oexmelin describes thus: the beast being dead, and the bones stripped out, the flesh is cut into pieces of the length of the arm, and salted, and the next day laid on the *buccan*; which consists of twenty or thirty bars laid across, half a foot from each other: under this they raise a thick smoke, adding the skin and bones of the beast to heighten it.

This is found vastly better than any simple sewel; in regard the volatile salts of those parts are by this means communicated to the flesh, and give it such a relish, as that after a little of this *buccaning*, the nicest palate will eat it without further preparation.

BUCCELLARII*, *Βυκελλάρη*, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition-bread.

* The word is formed from *bucellus*, a kind of loaf, or cake of a circular figure.

The *bucellarii* were also called, in respect of their country, *gallogæci*, or *helenogalata*, q. d. Greeks of Galatia: sometimes *maryandini*.

Authors are much divided as to the office and quality of the *bucellarii*: some give the denomination to parasites in the courts of princes and great men, maintained at their table and expences. In reality, among the Visigoths, *bucellarius* was a general name for all clients or vassals, who lived at the expence of their lords. Spelman rather supposes them to answer to what among us are called *tenants by military service*.—Others represent the *bucellarii* as stationary soldiers in the provinces, who, when the emperor commanded, marched

before and behind him as his body-guard.—According to others, they were men whom the emperors employed in putting persons to death secretly.

BUCCINA*, an ancient military, or rather musical instrument, used in war; especially for proclaiming the watches of the night, and giving notice to the soldiery when they were to mount, and when quit the guard.

* The word comes from *bucca*, mouth, and *cans*, I sing, because played on by the mouth: others suppose it formed from the Greek *βουκων*, or *βουκων*, which signifies the fame, formed from *βου*, bullock, and *cans*, I sing, because anciently made of bullocks horns; others from the Hebrew *buk*, a trumpet. Varro will have it to have been originally formed by *onomatopœia*, from *bou bou*, alluding to the sound it gives. Others, with more probability, derive it from *buccinum*, the name of a shell-fish.

The *buccina* is usually considered as a species of tuba, or trumpet; from which however in propriety it appears to have differed, not only in respect of figure, which in the tuba was strait, and in the *buccina* recurve or crooked, but in sound; that of the *buccina* being sharper, and audible to a greater distance than the trumpet-sound.

The *buccina* approached nearest to the cornu, or horn: originally the two seem to have been the same; though in after-times a difference arose; the name *buccinum* being restrained to the lesser sort, and the cornu to the larger.—Some also take the *buccina* to have been less crooked than the cornu, which made a full semicircle.

Varro assures, that the *buccinæ* were also called *cornua*, horns; because originally made of the horns of cattle, as is still done among some people. Servius intimates, as if they were at first made of goats or rams horns; and accordingly in scripture, the like instruments used both in war, and in the temple, are called *rams-horns*, *keren-jobel*, and *sopherath hajjebelim*, or *buccinæ* of rams.

BUCCINATOR, in anatomy, a muscle on each side the face, common to the lips and cheeks; making the inner substance of the latter.—Its fibres run from the processu coronæ of the lower jaw, to the angle of the mouth, and adhere to the upper part of the gums of both jaws: through its middle pass the upper ductus salivales. By this is contracted the cavity of the mouth, and the meat thrust forward to the teeth in mastication.

It has its name from *buccina*, trumpet; because, when swelled, it enlarges the cheeks, as in blowing a trumpet.—See *Tab. Anat. (Myol.) fig. 1. n. 10*.

BUCENTAUR*, the name of a large state-vessel, used by the Venetians in the ceremony of espousing the Sea, performed each Ascension-day with much pomp.

* The word comes from the Greek, *βουκένταυρος*; composed of *βου*, a particle of augmentation, used to denote an enormous greatness; and *κένταυρος*, *centaur*. Justiniani adds two other etymologies: the first from *bis*, and *taurus*, or rather *centaurus*, the name of one of Æneas's vessels in Virgil: the other from *bucentaurus*, for *decentaurus*, a word forged to signify a vessel capable of holding 200 men.

P. Justiniani gives a very precise description of the *bucentaur*; and adds, that its origin is carried up as high as the year of Christ 1311; though others trace it higher, to the year 1177, when the emperor Frederic Barbarossa came to Venice, to make peace with the republic and the pope: at which time the pope, in consideration of the services the state had done him, in sheltering him in their city, when he had been driven out of his own, granted them several privileges; and made a present to the doge of a gold ring, which is the origin of that yearly cast by the dogs, from the *bucentaur*, into the sea.

It is on Ascension-day, that the doge, being advanced in the *bucentaur* a little way into the gulph, throws a gold ring into the sea; and says, "We marry thee, O sea, in token of that true and perpetual dominion which the republic has over thee."

The archduchess Maria Josepha, married to the prince of Saxony, on the day of her entry into Dresden, was received in a magnificent galley, finely rigged, and called a *bucentaur*, because built after the model of that of Venice. *Palnitz Mem. T. 4. p. 74. seq.*

BUCEPHALUS, *Βουκεφάλος*. See the article **HORSE**.

BUCK. See the article **HUNTING**.

BUCKLER*, a piece of defensive armour, used by the ancients to screen their bodies from the blows of their enemies.

* The word comes from the barbarous Latin *bucularium*, of *bucula*, the umbo or middle point of this weapon, which had usually a head or mouth represented prominent thereon.

The *buckler* of Achilles is described in Homer, that of Æneas in Virgil, that of Hercules in Hesiod: Ajax's *buckler* was lined with seven bulls hides.

The shield succeeded the use of the *buckler*: yet the Spaniards still retain the *sword* and *buckler*, in their night-walks. *Bucklers*, on medals, are either used to signify public *virtus*, rendered to the Gods for the safety of a prince; or that he is esteemed the defender and protector of his people.—These were particularly called *ovine bucklers*, and were hung at altars, &c.

BUCOLICS*, *Pastorals*; a kind of poems relating to shepherds, and their flocks.

* The word is derived from the Greek, *βους*, and *κόλος*, *cibus*, meat; hence *βουκόλος*, to feed cattle; and *βουκόλος*, *bucolus*, a herdsman.

Bucolic-poetry is the most ancient of all the kinds of poetry; and is supposed to have had its origin in Sicily, amidst the mirth and diversions of the shepherds; and to have been inspired by love, and idleness: by degrees, their rural gallantries were brought under rules, and became an art. The concerns of the flocks, the beauties of nature, and the pleasures of a country-life, were their principal subjects. Moschus, Bion, and Theocritus, were the most agreeable among the ancient *bucolic* poets. See *ECLOGUE*, and *IDYLLION*. Fontenelle observes, that Theocritus's style is sometimes a little too *bucolic*. Some authors attribute the invention of *bucolic* poetry to a shepherd called *Daphnis*; and others to *Bucolius*, son of Laomedon: but this appears all fiction.

BUDS, among gardeners, denote the first tops of most fallow-plants, &c. reputed preferable to all other less tender parts. See *SALLET*. Such are young ashen keys, broom *buds*, and the like.

BUD, is used in the country language for a weaned calf of the first year; so called, because the horns are then in the bud.

BUDGE. See the article *BOUCHE*.

BUFET, in building. See the article *BEAUFET*.

BUFF, in commerce, a sort of leather prepared from the skin of the buffalo, or wild bull, a beast resembling an ox, but longer and bigger; having large thick horns, short black hair, and a very small head; common enough in the Levant, particularly about Smyrna, and Constantinople; where, as well as in Italy, it is frequently tamed, and wrought as we do oxen.

The skin of the buffalo being dressed in oil, after the manner of hammy, or chamois, makes what we call *buff-skin*; anciently much used among the military men, for a kind of coats or doublets; and still retained by some of our grenadiers, as well as the French gend'armery, on account of its exceeding thickness and firmness. It is also used for waist-belts, pouches, &c.

Buff-skins, or *Buff-leather*, makes a very considerable article in the English, French, and Dutch commerce, at Constantinople, Smyrna, and along the coasts of Africa.

The skins of elks, oxen, and other like animals, when dressed in oil, and prepared after the same manner as that of the buffalo, are likewise denominated *buff*; and used for the same purposes.—In France, there are a good number of considerable manufactories employed in the preparation of such skins; particularly at Corbeil, Paris, and Rouen: their first establishment is owing to the Sieur Jabac, a native of Cologne. The manner of preparation see under the article *SHAMMY*.

BUFFET. See the article *BEAUFET*.

BUFFOON, a droll, or mimic, who diverts the public by his pleasantries, and follies.

Menage, after Salmastius, derives the word from *buffo*; a name given to those who appeared on the Roman theatre with their cheeks blown up; that receiving blows thereon, they might make the greater noise, and set the people a laughing. Others, as Rhodiginus, makes the origin of *buffoonery* more venerable; deriving it from a feast instituted in Attica, by K. Erichtheus, on occasion of a priest, called *Buphon*: who after having sacrificed the first bullock on the altar of Jupiter Polion, or guardian of the city, fled hastily away, without any apparent reason; leaving the ax and other instruments on the ground, nor could he be stopped, or ever found afterwards. The instruments were hereupon delivered up to the judges, and solemnly tried; the ax found guilty, and the rest acquitted. This sacrifice was kept up in the same manner the following years: the priest fled, as the first; and the ax was condemned. As the whole ceremony was perfectly burlesque, the words *buffoons* and *buffooneries* have been since applied to all ridiculous mummeries and farces: this history is related by Rhodiginus.

BUGGERY, in our laws, signifies the crime of sodomy.

Sir Edward Coke defines *buggery*, *carnalis copula contra naturam, & hoc vel per confusionem specierum*, (viz. by a man's or woman's coupling with a brute beast) *vel sexuum*, by a man's having to do with a man, or a woman with a woman.—Each of which is felony, without benefit of clergy: in ancient times, such offenders were burnt by the common law. *Buggery* is usually excepted out of a general pardon. The practice is said to have been introduced into England by the Lombards; by whom it is usually supposed to have been borrowed from the *Baugres*, or *Bulgarians*.

The beryl of the Bulgarians was anciently also called *buggery*, *bugaria*.

BUILDING, a fabric, or place erected by art, of stone, or timber, either for shelter from the weather, or for security, magnificence, or devotion.

Regular BUILDING is that whose plan is square, its opposite sides equal, and the parts disposed with symmetry.

Irregular BUILDING is that, on the contrary, whose plan is not contained within equal or parallel lines, either by the nature of its situation, or the artifice of the builder; and whose parts have not any just relation to one another in the elevation. *Inulated BUILDING* is that which is not attached, joined, or contiguous to any other; but is encompassed with freets, or some open square, or the like; as St. Paul's, the Monument, &c.

A *BUILDING* is said to be *engaged*, when it is encompassed with others, and has no front towards any freet or public place, nor any communication without, but by a back passage.

An *Interred*, or *Sunk BUILDING*, is that whose Area is below the adjacent freet, court, or garden, &c. and whose lowest courtes of stone are hidden.

Felibien considers three kinds of buildings in architecture, viz. *sanct buildings*; as the temples and groves of the ancients, and our churches, chapels, &c.—*Public buildings*; as basilics, or courts of justice, tombs, theatres, amphitheatres, triumphal arches, gates, bridges, aqueducts, &c.—*Domestic or private buildings*, as palaces, and houses. Each of which see under their proper heads, *BASILICA*, *CHURCH*, *AMPHITHEATRE*, &c.

BUILDING is also used for the art or act of constructing, or raising an edifice.—In which sense it comprehends, as well the expences, as the invention and execution of the design thereof.

In building there are three things chiefly in view, viz. convenience, firmness, and delight.—To attain these ends, Sir Henry Wotton considers the whole subject under two heads, viz. the *seat or situation*, and the *work or structure*.

For the *Situation of a BUILDING*, either that of the whole is to be considered, or that of its parts.—As to the first, regard is to be had to the quality, temperature, and salubrity of the air; the convenience of water, fuel, carriage, &c. and the agreeableness of the prospect.

For the *second*, the chief rooms, studies, libraries, &c. are to lie towards the east; offices that require heat, as kitchens, distillatories, brew-houses, &c. to the south: those that require a cool fresh air, as cellars, pantries, granaries, &c. to the north: as also galleries for painting, museums, &c. which require a steady light.—He adds, that the ancient Greeks and Romans, generally situated the front of their houses to the south: but that the modern Italians vary from this rule.

—Indeed, in this matter, regard must still be had to the country; each being obliged to provide against its respective inconveniences: so that a good parlour in Egypt, might make a good cellar in England.—The situation being fixed on, the next thing to be considered is the

Work or Structure of the BUILDING, under which come first the principal parts, then the accessories, or ornaments.—To the principals, belong first, the materials; then the form, or disposition.

The *Materials of a BUILDING* are either stone, as marble, free-stone, brick, for the walls, &c. or wood, as fir, cyprès, cedar, for poils and pillars of upright use; oak for beams, fummars, and for joining and connection.

For the *Form or Disposition of a BUILDING*, it must either be *simple* or *mixed*.—The simple forms are either *circular* or *angular*: and the circular ones either *compleat*, as just spheres; or deficient, as ovals.

The circular form is very commodious, of the greatest capacity of any; strong, durable beyond the rest, and very beautiful: but then it is found of all others the most chargeable; much room is lost in the bending of the walls, when it comes to be divided; besides an ill distribution of light, except from the centre of the roof: on these considerations it was, that the ancients only used the circular form in temples and amphitheatres, which needed no partition.—Oval forms have the same inconveniences, without the same conveniences; being of less capacity.

For angular figures, Sir Henry Wotton observes, that building neither loves many, nor few angles: the triangle, viz. is condemned above all others, as wanting capacity and firmness; as also, because irrefolvable into any other regular figure in the inward partitions, besides its own.—For figures of five, six, seven, or more angles, they are fitter for fortifications than civil buildings. There is, indeed, a celebrated building of Vignola, at Caprarola, in form of a pentagon; but the architect had prodigious difficulties to grapple with, in disposing the lights, and saving the vacuities. Such buildings then, seem rather for curiosity than convenience; and for this reason, rectangles are pitched on, as being a medium between the two extremes. But again, whether the rectangle is to be just a square, or an oblong, is disputed? Sir Henry Wotton prefers the latter, provided the length do not exceed the breadth by above one third.

Mixed figures, partly circular and partly angular, are judged of from the rules of the simple ones; only they have this particular defect, that they offend against uniformity. Indeed uniformity and variety may seem to be opposite to each other: but Sir H. Wotton observes, they are not so related; and for an instance, he mentions the structure of the human body, where both meet.—Thus much for the first grand division, viz. the whole of a building.

The Parts of a BUILDING, Baptista Alberti comprises under five heads; *viz.* the *foundation, walls, apertures, partition, and cover.*

For the foundation, to examine its firmness, Vitruvius orders the ground to be dug up; an apparent solidity not to be trusted to, unless the whole mould cut through be found solid: he does not indeed limit the depth of the digging; Palladio limits it to a sixth part of the height of the building: this Sir Harry Wotton calls the *natural foundation*, whereon is to stand the substruction, or ground-work, to support the walls, which he calls the *artificial foundation*: this then is to be the level; its lowest ledge, or row, of stone only, close laid with mortar, and the broader the better; at the least, twice as broad as the wall: lastly, some add, that the materials below should be laid just as they grew in the quarry; as supposing them to have the greatest strength in their natural posture. De Lorme enforces this, by observing, that the breaking or yielding of a stone in this part but the breadth of the back of a knife, will make a cleft of above half a foot in the fabric above.—For palliation, or piling the ground-plot, so much commended by Vitruvius, we say nothing; that being required only in a moist marshy ground, which should never be chosen: nor perhaps are there any instances of this kind, where it was not necessity that drove them to it.

For the walls, they are either entire and continued, or intermitted; and the intermissions are either columns or pilasters. Entire, or continued walls, are variously distinguished; by some, according to the quality of the materials, as they are either stone, brick, &c. others only consider the position of the materials; as when brick or square stones are laid in their lengths, with sides and heads together, or the points conjoined, like a network, &c.

The great laws of muring are, that the walls stand perpendicular to the ground-work; the right angle being the cause of all stability: that the massiest and heaviest materials be lowest, as fitter to bear than be borne; that the work diminish in thickness, as it rises; both for ease of weight and expence: that certain courses, or ledges of more strength than the rest, be interlaid, like bones, to sustain the fabric from total ruin, if the under parts chance to decay: and lastly, that the angles be firmly bound; these being the nerves of the whole fabric, and commonly fortified, by the Italians, on each side the corners, even in brick buildings, with squared stones; which add both beauty and strength. See WALL. The intermissions, as before observed, are either columns or pilasters: whereof there are five orders, *viz.* *Tuscan, Doric, Ionic, Corinthian, Composite*; each of which see distinctly considered under its respective head, *TUSCAN, DORIC, &c.* see also *COLUMN, PILASTER, and ORDER.*

Columns and pilasters are frequently, both for beauty and majesty, formed archwise; the doctrine of which see under ARCH.

For the apertures, they are either doors, windows, stair-cases, chimneys, or conduits for the sullage, &c. which see under their heads, *DOOR, WINDOW, &c.*—Only, with regard to the last, it may be observed, that art should imitate nature in these ignoble conveyances, and separate them from sight, where a running water is wanting, into the most remote, lowest, and thickest part of the foundation; with secret vents, passing up through the walls like tunnels to the open air; which the Italians all commend for the discharge of noisome vapours. See SEWERS, &c.

For the partition, or distribution of the ground-plot into apartments, &c. Sir H. Wotton lays down these preliminaries; that the architect never fix his fancy on a paper-draught, how exactly soever set off in perspective; much less on a mere plan, without a model, or type of the whole structure, and every part thereof, in pasteboard or wood; that this model be as plain and unadorned as possible, to prevent the eye's being imposed on; and that the bigger this model, the better.

In the partition itself, there are two general views, *viz.* the *gracefulness, and usefulness* of the distribution, for rooms of office and entertainment; as far as the capacity thereof, and the nature of the country will allow.—The gracefulness will consist in a double analogy, or correspondence; first, between the parts and the whole, whereby a large fabric should have large partitions, entrances, doors, columns, and in brief, all the members large: the second, between the parts themselves, with regard to length, breadth, and height. The ancients determined the length of their rooms, that were to be oblong, by double their breadth; and the height by half their breadth and length added together. When the room was to be precisely square, they made the height half as much more

as the breadth: which rules the modern take occasion to dispense with; sometimes squaring the breadth, and making the diagonal thereof the measure of the height; and sometimes more. This deviating from the rules of the ancients is ascribed to M. Angelo.

The second consideration in the partition is, the *usefulness*; which consists in the having a sufficient number of rooms of all kinds, with their proper communications, and without distraction. Here the chief difficulty will lie in the lights and stair-cases: the ancients were pretty easy on both these heads, having generally two cloistered open courts, one for the women's side, the other for the men: thus the reception of light into the body of the building was easy, which among us must be supplied, either by the open form of the building, or by graceful refuges or breaks, by terracing a story in danger of darkness, and by abajours, or sky-lights.—For casting the stair-cases, it may be observed, that the Italians frequently distribute the kitchen, bake-house, buttery, &c. under ground, next above the foundation, and sometimes level with the floor of the cellar; raising the first ascent into the house fifteen feet or more: which, beside the removing of annoyances out of the sight, and gaining so much room above, does, by elevating the front, add a majesty to the whole. Indeed, Sir H. Wotton observes, that in England the natural hospitality thereof will not allow the buttery to be so far out of sight; besides, that a more luminous kitchen, and a shorter distance between that and the dining-room are required, than that partition will well bear.

In the distribution of lodging-rooms, it is a popular and ancient fault, especially among the Italians, to cast the partitions so, as when the doors are all open, a man may see through the whole house; this is grounded on the ambition of shewing a stranger all the furniture at once: an intolerable hardship on all the chambers, except the inmost, where none can arrive but through all the rest, unless the walls be extreme thick for secret passages: nor will this serve the turn, without at least three doors to each chamber; a thing inexcusable except in hot countries: besides its being a weakening to the building, and the necessity it occasions of making as many common great rooms as there are stories, which devours a great deal of room, better employed in places of retreat; and must likewise be dark, as running through the middle of the house.

In the partition, the architect will have occasion for frequent shifts; through many of which his own sagacity, more than any rules, must conduct him. Thus, he will be frequently put to struggle with scarcity of ground; sometimes to damn one room for the benefit of the rest, as to hide a buttery under a stair-case, &c. at other times, to make those the most beautiful which are most in sight: and to leave the rest, like a painter, in the shadow, &c.

For the covering of the building; this is the last in the execution, but the first in the intention: for who would build, but to shelter? In the covering, or roof, there are two extremes to be avoided, the making it too heavy or too light: the first will press too much on the under-work; the latter has a more secret inconvenience; for the cover is not only a bare defence, but a band or ligature to the whole building; and as such requires a reasonable weight. Indeed, of the two extremes, a house top-heavy is the worst. Care is likewise to be taken, that the pressure be equal on each side; and Palladio wishes, that the whole burthen might not be laid on the outward walls, but that the inner might likewise bear their share.—The Italians are very curious in the proportion and gracefulness of the pent or slopiness of the roof; dividing the whole breadth into nine parts, whereof two serve for the height of the highest top or ridge from the lowest; but in this point, regard must be had to the quality of the region; for, as Palladio insinuates, those climates which fear the falling of much snow, ought to have more inclining pences than others. Thus much for the principal or essential parts of a building.

For the *accessories, or ornaments*, they are fetched from painting and sculpture. The chief things to be regarded in the first are, that no room have too much, which will occasion a surfeit; except in galleries, or the like: that the best pieces be placed where there are the fewest lights: rooms with several windows are enemies to painters, nor can any pictures be seen in perfection, unless illuminated, like nature, with a single light: that in the disposition regard be had to the posture of the painter in working, which is the most natural for the posture of the spectator; and that they be accommodated to the intentions of the room they are used in.

For sculpture, it must be observed, that it be not too abundant; especially at the first approach of a building, or

at the entrance, where a Doric ornament is much preferable to a Corinthian one: that the niches, if they contain figures of white stone, be not coloured in their concavity too black, but rather dusky; the light being dispensed with too sudden departures from one extreme to another. That fine sculptures have the advantage of nearness, and coarser of distance; and that in placing of figures aloft, they be reclined a little forwards: because, the visual ray extended to the head of the figure is longer than that reaching to its feet, which will of necessity make that part appear further off; so that to reduce it to an erect posture, it must be made to stoop a little forwards. M. le Clerc, however, will not allow of this refutation, but will have every part in its just perpendicular.

As to the stone and stucco, used in buildings, which are fresh and white at first, and are commonly supposed to be discoloured with the air, moisture, smog, &c. the true cause thereof is, that they become covered with a minute species of plants, which alter their colour. A sort of lichens yellowish, brownish, or greenish, which commonly grow on the barks of trees, do grow also on stones, mortar, plaster, and even on the flates of houses, being propagated by little light seeds, dispersed by the wind, rain, &c. The best preservative known, is lime.

To judge of a BUILDING. Sir H. Wotton lays down the following rules.—That before fixing any judgment, a person be informed of its age; since, if apparent decays be found to exceed the proportion of time, it may be concluded, without further inquiry, either that the situation is naught, or the materials or workmanship too slight.—If it be found to bear its years well, let him run back, from the ornaments and things which strike the eye first, to the more essential members; till he be able to form a conclusion, that the work is commodious, firm, and delightful; the three conditions, in a good building, laid down at first, and agreed on by all authors.—This, our author esteems the scientific way of judging.

Vassari proposes another; viz. by passing a running examination over the whole edifice, compared to the structure of a well-made man; as, whether the walls stand upright on a clean footing and foundation; whether the building be of a beautiful stature; whether, for the breadth, it appear well burnished; whether the principal entrance be on the middle line of the front, or face, like our mouths; the windows, as our eyes, set in equal number and distance on both sides; the offices, like the veins, usefully distributed, &c.

Vitruvius gives a third method of judging: summing up the whole art under these six heads: ordination, or settling the model and scale of the work; disposition, the just expression of the first design thereof: (which two, Sir H. Wotton thinks, he might have spared, as belonging rather to the artificer than the censurer) *eurythmy*, the agreeable harmony between the length, breadth, and height of the several rooms, &c. *symmetry*, or the agreement between the parts and the whole; *decor*, the due relation between the building and the inhabitant, whence Palladio concludes, the principal entrance ought never to be limited by any rule, but the dignity and generosity of the master. And lastly, *distribution*, the useful casting of the several rooms, for offices, entertainment, or pleasure.—These last four are ever to be run over, ere a man pass any determinate censure: and these alone, Sir Henry observes, are sufficient to condemn or acquit any building whatever.

Dr. Fuller gives us two or three good aphorisms in building; as,—1°. Let not the common rooms be several, nor the several rooms common: i. e. the common rooms not to be private or retired, as the hall, galleries, &c. which are to be open; and the chambers, &c. to be retired.—2°. A house had better be too little for a day, than too big for a year. Houses therefore to be proportioned to ordinary occasions, not extraordinary.—3°. Country-houses must be substantives, able to stand of themselves: not like city buildings, supported and sheltered on each side by their neighbours.—4°. Let not the front look asquint on a stranger; but accost him right, at his entrance.—5°. Let the offices keep their due distance from the mansion-house; those are too familiar, which are of the same pile with it.

The method of building, both in Barbary and the Levant, seems to have continued the same from the earliest ages, without the least alteration or improvement. *Shaw Trav.*

p. 273.

Section of a BUILDING. See the article SECTION.

BULFAO, a musical instrument, much used by the Negroes of Guiney, &c.

It consists of several pipes made of hard wood, set in order; which diminish by little and little in length, and are tied together with thongs of thin leather twisted about small round wands, put between each of the pipes, so as

to form a small interstice. They play on it with sticks, the ends of which are covered with leather, to make the sound less harsh. *Fréger Voyag.* p. 36. *seq.*

BULB, **BULBUS**, in botany, a thick root, nearly round, composed of several skins, or coats, laid one over another; sending forth from its lower part a great number of fibres.—Such are the roots of the common onion, the daffodil, the hyacinth, &c.

The same denomination is sometimes also given to tuberous roots, composed of one solid continuous substance, without any skins laid over one another.

Dr. Grew observes, that in bulbous plants, as well as many other perennial ones, the root is annually renewed, or repaired, out of the trunk or stalk it felt: that is, the basis of the stalk, continually and insensibly descends below the surface of the earth; and hiding it self therein, is, both in nature, place, and office, changed into a true root. Thus, in brownwort, the base linking by degrees, becomes the upper part of the root; the next year the lower part; and the next it rots away, a fresh supply coming.

BULIMY*, **BULIMIA**, or **BULIMUS**, an enormous appetite, attended with fainting, and coldness of the extremities.

* The word is Greek, βολιμία, or βολιμος, formed of βολις, ox; and λιμος, hunger; as importing that the patient has the stomach of an ox; or, as others term it, sufficient to eat up an ox; which however would be better βουφαγία, than βολιμία. In reality, there needs not so much straining to account for the origin of the word, which may be more easily and naturally accounted for after Varro and Suidas; from the particle βολι, which is prefixed by the Greeks to divers words, only as an intensive; and λιμος, hunger, *q. d.* a great hunger: much as they say βουταί, for a great boy; βουλιος, for a large fig.

In the Philosophical Transactions, we have an account of a person affected with a *bulimy*, to such a degree that he would eat up an ordinary leg of veal at a common meal, and would feed on fowls, &c. he was cured by throwing up several worms, of the length and thickness of a tobacco-pipe. See HUNGER.

BULK of a ship, denotes her whole content in the hold for stowage of goods.

Breaking BULK. See the article BREAKING.

Bulk HEADS are partitions made across a ship, with boards of timber, whereby one part is divided from another.—The *bulk-head afore* is the partition between the fore-castle and gratings in the head, and in which are the chafe-ports.—See *Tab. Ship.* fig. 2. n. 11. 24. 48. 85. 95. 99. 102. 115.

BULL*, in ecclesiastical writers, denotes an instrument dispatched out of the Roman chancery, sealed with lead; answering to the edicts, letters patent, and provisions, of secular princes.

* The word *bull* is derived from *bulla*, a seal; and that from *bulla*, a drop, or bubble; or, according to others, from the Greek βουλή, council; according to Pezron, from the Celtic *bul*, or *bwl*, a bubble.

The *bull* is the third kind of apostolical rescript, and the most in use, both in affairs of justice, and of grace. It is written on parchment; by which it is distinguished from a *brief* or simple *signature*, which is on paper. A *bull* is properly a signature enlarged: what the latter comprehends in a few words, the former dilates and amplifies. Yet the *bull* is not to take in more matter than the signature; being only to amplify the stile in clauses of ceremony.

If the *bulls* be letters of grace, the lead is hung on filken threads; if they be letters of justice and executory, the lead is hung by a hempen cord.—They are all wrote in an old roman Gothic letter.

The *bull*, in the form wherein it is to be dispatched, is divided into five parts, viz. the narrative of the fact; the conception; the clause; the date; and the salutation, in which the pope takes on himself the quality of *servant of servant of God, servus servorum Dei*.

Properly speaking, it is the seal, or pendant lead alone that is the *bull*: it being that which gives it both the title, and authority. The seal presents, on one side, the heads of St. Peter and St. Paul; on the other, the name of the pope, and the year of his pontificate. See SEAL.

By *bulls*, jubilees are granted: without them no bishops, in the Romish church, are allowed to be consecrated. In Spain, *bulls* are required for all kinds of benefices; but in France, &c. simple signatures are sufficient; excepting for bishoprics, abbies, dignities, and priories conventual. According to the laws of the Roman chancery, no benefice exceeding twenty-four ducats per annum, should be conferred without *bulls*: But the French would never submit to this rule, except for such benefices as are taxed in the apostolical chamber: for the rest, they reserve the right of dissembling the value, expressing it in general terms:

termis: *Cujus & illi forsan annexorum fructus 24 ducatorum auri, de camera secundum communem estimationem, valorem annuum non excedunt.*

The bulls brought into France are limited and moderated by the laws and customs of the land, before they are registered; nor is any thing admitted till it have been well examined, and found to contain nothing contrary to the liberties of the Gallican church: those words, *propria motu*, in a bull, are sufficient to make the whole be rejected in France.

Nor do the Spaniards admit the papal bulls implicitly; but having been examined by the King's council, if there appear any reason for not executing them, notice thereof is given to the pope by a supplication; and the bull, by this means, remains without effect: and the like method of proceeding with the court of Rome is observed by most of the rest of the courts of Europe, in the papal communion.

To fulminate bulls is, to make publication thereof, by one of the three commissaries to whom they are directed; whether he be the bishop or official. This publication is sometimes opposed; but when it is, the fault is not charged on the pope who issued the bull; but an appeal is brought to him against the person who is supposed to make it: thus the fault is laid, where it is known not to be just, to evade affronting the pontiff.

The bull in *cena domini* is a bull read every year on Maundy-thursday, in the pope's presence; containing various excommunications and execrations, against heretics, those who disobey the see, who disturb or oppose the exercise of ecclesiastical jurisdiction, &c.

After the death of the pope, no bulls are dispatched during the vacancy of the see: to prevent any abuses, therefore, as soon as the pope is dead, the vice-chancellor of the Roman church takes the seal of the bulls; and in the presence of several persons, orders the name of the deceased pope to be erased; and covers the other side, on which are the heads of St. Peter and St. Paul, with a linen cloth; sealing it up with his own seal, and giving it thus covered to the chamberlain, to be preserved, that no bulls may be sealed with it in the mean time.

Golden BULL * is a denomination peculiarly given to an ordinance, or statute, made by the emperor Charles IV. in 1356, said to have been drawn up by that celebrated lawyer, Bartoli, and still reputed the *magna charta*, or fundamental law of the empire.

* It is thus called from a golden seal fixed to it, such as were used by the emperors of Constantinople, annexed to their edicts. Spelman also speaks of a golden bull used in a treaty of alliance between our Henry VIII. and Francis I. of France.

Till the publication of the *golden bull*, the form and ceremony of the election of an emperor were dubious and undetermined; and the number of electors was not fixed. This solemn edict regulated the functions, rights, privileges, and pre-eminences of the electors.

The original, which is in Latin, on vellum, is kept at Frankfurt. On the backside of it there are several knots of black and yellow silk; to which hangs a bull, or seal of gold.

This ordinance, containing thirty articles, was approved of by all the princes of the empire, and remains still in force.—The election of the empire is by it declared to belong to seven electors; three of them ecclesiastics, viz. the archbishop of Mentz, Treves, and Cologne; and four seculars; viz. the king of Bohemia, prince Palatine, duke of Saxony, and marquis of Brandenburg.

BULL's eye, in astronomy. See ALDEBARAN.

BULLET *, an iron or leaden ball, or shot, wherewith fire-arms are loaded.

* Some derive the word from the Latin *botellus*, others from the Greek *βουλον*, to throw.

According to Merfenne, a *bullet*, shot out of a great gun, flies 92 fathom in a second of time, which is equal to 589 English feet; and, according to Huygens, it would be 25 years in passing from the earth to the sun: but, according to some very accurate experiments of Mr. Derham, it flies, at its first discharge, 510 yards in five half seconds; which is a mile in a little above seventeen half seconds: allowing therefore the sun's distance 86051398 English miles, a *bullet* would be 32 years and a half in its passage at the full speed.

Bulls are of various kinds, viz. *red-hot bullets*, made hot in a forge; intended to set fire to places where combustible matters are found.

Flowen bullets, shells made cylindrical, with an aperture and a fusee at one end, which giving fire to the inside, when in the ground, it bursts, and has the same effect with a mine.

Chain-bullets, consisting of two balls, joined by a chain three or four foot apart.

Branch bullets, two balls joined by a bar of iron five or six inches a-part.

Two-headed bullets, called also *angels*, being two halves of a bullet joined by a bar, or chain: these are chiefly used at sea, for cutting of cords, cables, sails, &c.

Quarter BULLET. See the article QUARTER.

BULLET moulds. See the article MOULD.

BULLION, denotes gold or silver in the mass, or billet.

Silver and gold, whether coined or uncoined, (though used for a common measure of other things) are no less a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to national advantage, as any other commodity.—No nation can ever be considerable in trade, that prohibits the exportation of *bullion*.—And it is more for the public advantage to export gold or silver coined, than uncoined: since, in the former, we have the advantage of the manufacture.—See *Treat. on E. I. Trad.* 4^o. 1681. p. 4. *Child on trade*, p. 73.

BULLION is also used for the place where the king's exchange is kept: or where gold and silver is brought in the lump to be tried, or exchanged.

BULLOCKS eye, in architecture. See the article EYE.

BULWARK, *propugnaculum*, in the ancient fortification, amounts to much the same with *bastion* in the modern.

BUMICILLI, a sect of Mahometans in Africa, said to be great forcerers: they fight against the devil, as they say; and frequently run about cover'd with blood and bruises, in a terrible fright: they sometimes counterfeit combats with him at noon-day, and in the presence of numbers of people, for the space of two or three hours, with darts, javelins, scimiters, &c. laying desperately about them, till they fall down on the ground oppressed with blows: after resting a moment, they recover their spirits and walk off.

What their rule is, is not well known; but they are said to be an order of religious.

BUNT of a sail is the middle part of it, purposely formed into a kind of bag, or pouch, that it may catch and receive the more wind.

The *bunt* is chiefly used in top-sails; for courses are for the most part cut square, or at least with a small allowance for *bunt* or compass.—They say, the *bunt holds much leeward wind*; that is, it hangs too much to leeward.

BUNT-lines are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope to a crengle; and so are reeved through a small block, seized to the yard: their use is to trice up the *bunt* of the sail, for the better furling it up.—See *Tab. Ship.* fig. 1. n. 48. 74. gr. 116.

BUOY, at sea, a piece of wood, or cork, sometimes an empty cask well closed, swimming on the surface of the water, and fastened by a chain or cord to a large stone, piece of broken cannon, or the like; serving to mark the dangerous places near a coast, as rocks, shoals, wrecks of vessels, anchors, &c.

In lieu of *buoys*, are sometimes placed pieces of wood, in form of masts, in the conspicuous places: sometimes large trees are planted in a particular manner; in number, two at the least, to be taken in a right line, the one hiding the other; so as the two may appear to the eye no more than one.

Buoy is also used for a piece of wood, or a barrel at sea, fastened so as to float directly over the anchor; that the men who go in the boat to weigh the anchor may certainly know where the anchor lies.

BURDEN *, or rather **BURDON**, in music denotes the drone, or deepset sound of an organ; being that produced by the thickest pipe.

* The word is French, *bourdon*; formed, according to some, from the law Saxon *burden*, *crepitum emittere*, to break wind backwards. Others will have *bourdon* originally to signify a buz, or hum, as that of bees; answering to the Latin, *bombus*; and formed by onomatopoeia.

The modern *bourdon* answers to the note which the Greeks called *πυρολαβανισμος*.

BURDEN also denotes the pipe *, or string it self, by which such sound is given.

* Matth. Paris will have the name *burdon* to have been originally given this pipe, on account of its resemblance to a pilgrim's staff, anciently called also *burdo*.

BURDEN of a ship is its content, or the number of tons it will carry.

To determine the *burden* of a ship, multiply the length of the keel, taken within board, by the breadth of the ship, within board, taken from the midship beam from plank to plank, and the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank; and divide the last product

duft by 94, and the quotient is the content of the tonnage required. See **FREIGHT**, &c.

BURFORD *saddle*. See the article **SADDLE**.

BURGAGE, a tenure proper to boroughs and towns, whereby the inhabitants hold their lands or tenements of the king, or other lord, at a certain yearly rate.

BURGESS, an inhabitant of a borough, or walled town; or one who possesses a tenement therein.

In other countries, *burgess* and citizen are confounded together, but with us they are distinguished.

The word is also applied to the magistrates of some towns; as the bailiff, or *burgesses* of Leominster.

BURGESS is now ordinarily used for the representative of a borough-town in parliament.

Filius vero burgenfis, etatem habere tunc intelligitur cum diferte fceuerit denarios numerare & pannos uhnare, &c.

BURGGRABE properly denotes the hereditary governor of a castle, or fortified town, chiefly in Germany.

* The word is compounded of *bourg*, town, and *graf*, or *grau*, count.

BURGHERMASTERS *, **BOURGERMESTERS**, or **BURGMESTERS**, chief magistrates in the cities of Germany, Holland and Flanders; to whom belongs the giving of orders for the government, administration of justice, policy, and finances of the place: though the authority and office is not every where alike; each city having its particular laws and statutes.

* The word is formed from the two Flemish words, *berger*, *burgess* or citizen; and *meester*, master. Some express it in Latin by *consul*, others by *senator*.—M. Bruneau observes, that *burgmaster*, in Holland, answers to what is called *alderman* and *sheriff* in England; *attorney* at Compiegne, *capitoul* at Toulouse, *consul* in Languedoc, &c.

BURGLARY, an unlawful entering into another man's dwelling, wherein some person is, or into a church in the night-time; in order to commit some felony, or to kill some person, or to steal something thence, or do some other felonious act: whether the same be executed or not.

The like offence, by day, we call *house-breaking*, &c. It shall not have benefit of clergy.

BURGMESTERS. See the article **BURGHERMASTERS**.

BURGMOTE, a borough-court; or court held for a town or borough. See **MOTE**, and **COURT**.

BURLESQUE, a jocular kind of poetry, chiefly used in the way of drollery, and ridicule, to deride persons, and things.

The word, and the thing too, seem to be both modern: F. Vassall maintains, in his book *de ludicra dictione*, that *burlesque* was absolutely unknown to the ancients; against the opinion of some others, that one Raintovius, in the time of Ptolemy Lagus, turned the serious subjects of tragedy into ridicule: which, perhaps, is a better plea for the antiquity for farce, than of *burlesque*.

The Italians seem to have the justest claim to the invention of *burlesque*. The first author in this kind was Bernia; he was followed by Lalli, Caporali, &c. From Italy it passed into France, and became there so much the mode, that in 1649 appeared a book under the Title of, *The passion of our Saviour in burlesque verse*. Thence it came into England; but the good sense of the English never adopted or owned it, notwithstanding one or two have excelled in it.

BURN, in a medicinal sense, denotes a solution of the continuity of a part of the body, by the force of fire.

Of *burns*, physicians usually make several degrees: the first, when there are only a few pustules raised on the skin, with a redness, and a separation of the epidermis from the genuine skin.—The second when the skin is burnt, dried, and shrunk, but without any crust or scab.—The third is, when the flesh, veins, nerves, &c. are shrunk, and form a scab.

Lusitanus recommends an unguent, made of the ashes of laurel-leaves burnt, with hog's fat dropped on them, for a *burn*; or, on occasion, the unguentum populeum, with vine-leaves laid over it.—Panarole observes, that clay laid on a *burn* abates the pain; and that the brewers in Holland, use a decoction of ivy for the cure of *burns*.

Burns, however, are not only diseases, but in some cases remedies: M. Homberg observes, that in the isle of Java, the natives cure themselves of a colic, otherwise mortal, by burning the soles of their feet; and cure themselves of a panaris, by dipping their finger in boiling water several times.

Travellers relate many other cases of other diseases cured by *burning*; and we see the effects of it our selves, in horses, hounds, birds of prey, &c.

A kind of downy matter brought from the Indies, has been likewise used for the gout; applied, by *burning* it on the part affected.

M. Homberg gives us instances of two women cured, the one of a violent disease in the head and eyes, and the other of a disease in the legs and thighs, by the accidental *burning* of those parts. He adds, that *burning* may cure in three manners; either by putting the peccant humours into a greater motion, and making them take new routs; or by dissolving and breaking their viscosity; or by destroying the canals which brought them in too great quantities.

Heart-BURN. See the article **HEART**.

BURNING, the action of fire on some pabulum or fuel, whereby the minute parts thereof are torn from each other, put into a violent motion; and some of them assuming the nature of fire themselves, fly off *in orbem*, while the rest are diffipated in form of vapour, or reduced to ashes.

See **FIRE**.

BURNING, or **BRENNING**, in our ancient customs, denotes an infectious disease, got in the stews, by conversing with leud women; supposed to be the same that we now call the *venereal disease*.—Whence that disease is argued to be much more ancient than the common epocha of the siege of Naples.

The chief objection against *burning* being the same with the venereal disease is, that the remedies prescribed against the former, would be ineffectual in the latter: but, it is not to be expected, the measures of the ancient physicians should be calculated for the removing of any malignity in the mass of blood or other juices, as in the modern practice; inasmuch as they looked on the disease as merely local, and the whole of the cure to depend on the removal of the symptoms: besides this, it is matter of frequent observation, that some diseases grow more violent, and others more remiss in course of time: so that the remedies which might have availed for the ancient *breunning*, may now fail as to the modern *peux*.

The process for the cure, as delivered by J. Arden, chirurgeon to K. Henry IV. is thus:—*Contra incendium virgae virilis interius ex calore & excoaratione, fiat talis syringa (i. e. injectio) lenitiva. Accipe lac mulieris masculinum nutritis, & parum zacarium, oleum viola & pistana: quibus commixtis per syringam infundatur.*

In an ancient MS. written about the year 1300, is a receipt for *breunning* of the *pyntyl yat men clepe the apogalle*; *galle* being an old word for a running sore. And in another MS. written fifty years after, is a receipt for *burning* in that part by a woman. Simon Fish, a zealous promoter of the reformation, in his *Supplication of beggars*, presented to King Henry VIII. 1530, speaking of the Romish priests, says, "They catch the pocks of one woman, and bare "them to another; they be burnt with one woman, "and bare it to another; they catch the leproy of one "woman, and bare it to another." And Boord, a priest and physician in the same reign, begins one of his chapters of his *Breviary of health*, thus: "The 10th chapter doth "shew of the *burning* of an harlot." The same author adds, that if a man be burnt with an harlot, and do meddle with another woman within a day, he shall burn the woman he shall meddle withal: and as an immediate remedy against the *burning*, he recommends the washing the pudenda two or three times with white-wine, or else with sack and water.—In another MS. of the vocation of John Bale to the bishopric of Osifory, written by himself, he speaks of Dr. Hugh Welton (who was dean of Windfor in 1556, but deprived by cardinal Pole for adultery) thus: "At this day is lecherous Welton, "who is more practised in the art of *breach-burning*, "than all the whores of the stews.—He not long ago "brent a beggar of St. Botolph's parish." See

STEWES.

BURNING-fever. See the article **FEVER**.

BURNING-glass, or *burning-mirror*, a machine whereby the sun's rays are collected into a point; and by that means their force and effect extremely heightened, so as to burn objects placed therein.

Burning-glasses are of two kinds: the first convex, called *lentes causticae*; which transmit the rays of light, and in their passage refract or incline them towards the axis; having the property of lens's, and acting according to the laws of refraction.

The second, which are the more usual, are concave; very improperly called *burning-glasses*, being usually made of metal: these reflect the rays of light, and in that reflection, incline them to a point in their axis; having the properties of specula or mirrors; and acting according to the laws of reflection: which see under **MIRROR**, and **REFLECTION**.

The first, or convex kind, authors suppose to have been unknown to the ancients; but the latter they are generally allowed to have been acquainted with. Historians tell us, that Archimedes, by means hereof burnt a whole fleet. And though the effect related be very improbable, yet does it sufficiently prove such things were then known. The machines then used, no body doubts, were metallic and concave; and had their focus by reflexion: it being agreed, that the ancients were unacquainted with the refracted foci of convex glasses. Yet, M. de la Hire has discovered even these, in the *Clouds* of Aristophanes; where Strepsiades tells Socrates, of an expedient he had to pay his debts, by means of a round transparent stone or glass, used in lighting of fires; by which he intended to melt the bond: which in those days was written on wax. The glass here used to light the fire, and melt the wax, M. de la Hire observes, could not be concave; since a reflected focus coming from below upwards, would have been exceedingly improper for that purpose: and the old scholiast of Aristophanes, confirms the sentiment. Pliny makes mention of globes of glass and crystal, which being exposed to the sun, burnt the clothes and flesh on people's backs; and Lactantius adds, that a glass sphere, full of water, and held in the sun, lighted the fire even in the coldest weather: which incontestably proves the effects of convex glasses.

Indeed, there is some difficulty in conceiving how they should know such glasses burnt, without knowing they magnified; which it is granted they did not, till towards the close of the thirteenth century, when spectacles were first thought on. For as to those passages in Plautus which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing: and he solves this, by observing, that their *burning-glasses* being spheres, either solid, or full of water, their foci would be one fourth of their diameter distant from them: if then their diameter were supposed half a foot, which is the most we can allow, an object must be at an inch and a half's distance to perceive it magnified: those at greater distances do not appear greater, but only more confused, though the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and their *burning* one known: it is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Every concave mirror, or speculum, collects the rays dispersed through its whole concavity, after reflexion, into a point or focus, and is therefore a *burning mirror*.

Hence, as the focus is there where the rays are the most closely contracted, if it be a segment of a large sphere, its breadth must not subtend an arch above eighteen degrees: if it be a segment of a smaller sphere, its breadth may be thirty degrees; which is verified by experiment.

As the surface of a mirror, which is a segment of a larger sphere, receives more rays than another of a less, if the latitude of each subtend an arch of eighteen degrees; or even more, or less, provided it be equal; the effects of the greater mirror will be greater than those of the less.

And, as the focus is contained between the fourth and fifth part of the diameter, mirrors that are segments of greater spheres burn at a greater distance than those which are segments of a smaller.

Since, lastly, the *burning* depends on the union of the rays; and the union of the rays on the concave spherical figure, it is no wonder, that even wooden mirrors, gilt, or those prepared of alabaster, &c. covered with gold; nay, even that those made of paper, and covered with straw, should be found to burn.

Among the ancients, the *burning* mirrors of Archimedes and Proclus are eminent; by one of which, the Roman ships besieging Syracuse, under the command of Marcellus, according to the relations of Zonaras, Tzetzes, Galen, Eustathius, &c. and by the other, the navy of Vitalian besieging Byzantium, according to the same Zonaras, were burnt to ashes.

Among the moderns, the most remarkable *burning* mirrors, are those of Settala, of Vilette, and Tschirnhausen, and the new complex one of Mr. Buffon. Settala, canon of Padua, made a parabolical mirror, which, according to Schottus, burnt pieces of wood, at the distance of fifteen or sixteen paces.

M. Tschirnhausen's mirror, at least, equals the former, both in bigness and effect.—The following things are noted of it in the *Acta eruditum*. 1. Green wood takes fire instantaneously, so as a strong wind cannot ex-

tinguish it. 2. Water boils immediately, and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently, and iron or steel-plate becomes red-hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red-hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice-stone emitted from a volcano, melts into white glass: and, 8. A piece of a crucible also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one.—The breadth of this mirror is near three Leipzig ells, its focus two ells distant from it: it is made of copper, and its substance is not above double the thickness of the back of a knife.

Vilette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third presented by the French king to the Royal Academy; a fourth has been in England, where it was publicly exposed.—The effects hereof, as found by Dr. Harris and Dr. Desaguliers, are, that a silver six-pence is melted in 7' and $\frac{1}{2}$; a king George's half-penny in 16', and runs with a hole in 34. Tin melts in 3', cast iron in 16', slate in 3'; a fossil shell calcines in 7'; a piece of Pompey's pillar at Alexandria, vitrifies in the black part in 50', in the white 54'; copper ore in 8': bone calcines in 4', vitrifies in 33. An emerald melts into a substance like a turquoise stone; a diamond weighing four gr. loses $\frac{1}{2}$ of its weight: the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus: but when once vitrified, the mirror can go no further with them.—This mirror is forty-seven inches wide; and is ground to a sphere of seventy-six inches radius: so that its focus is about thirty-eight inches from the vertex. Its substance is a composition of tin, copper, and tin-glass.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a *burning glass*. The most considerable of this kind known, is that made by M. de Tschirnhausen: the diameters of his lens's are three and four feet; the focus at the distance of twelve feet, and its diameter an inch and half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first; and placed in that place where the diameter of the cone of rays formed by the first lens, is equal to the diameter of the second: so that it receives them all; and the focus from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably.

Its effects, among others, as related in the *Acta Erudit.* Lipsiæ, are, that it lights hard wood, even moistened with water, into a flame, instantly; that water, in a little vessel, begins to boil presently; all metals are melted; brick, pumice stone, Delphic wares, and the asbestos stone, are turned into glass; sulphur, pitch, &c. melted under water: the ashes of vegetables, woods, and other matters, transmuted into glass. In a word, every thing applied to its focus, is either melted, turned into calx, or into smelt; and the colours of jewels, and all other bodies, metals alone excepted, are changed by it. He observes, that it succeeds best when the matter applied is laid on a hard charcoal well burnt.

Though the force of the solar rays be here found so stupendous; yet the rays of the full moon, collected by the same *burning-glass*, do not exhibit the least increase of heat.

Further, as the effects of a *burning* lens depend wholly on its convexity, it is no wonder that even those prepared of ice produce fire, &c. A lens of that kind is easily prepared, by putting a piece of ice into a skittle, or hollow segment of a sphere, and melting it over the fire, till it accommodate it self to the figure thereof.

Nor will those ignorant of dioptrics be less surprised to see flame, and the effects thereof, produced by means of the refraction of light in a glass bubble with water. See LENS.

Wolfius tells us, that an artist of Dresden made *burning* mirrors of wood, bigger than those of M. Tschirnhausen or Vilette, which had effects at least equal to any of them.—Traberus teaches how to make *burning* mirrors of leaf gold; viz. by turning a concave, laying its inside equally with pitch, and covering that with square pieces of the gold, two or three fingers broad, fastening them on, if need be, by fire. He adds, that very large mirrors may be made, of thirty, forty,

BUS

or more concave pieces, artfully joined in a turned wooden dish or skuttle; the effects of which will not be much less, than if the surface was continuous.—Zahnus adds, further, that Newman, an engineer at Vienna, in 1699, made a mirror of pasteboard, covered within side with straw glued to it; by which all kinds of metals, &c. were readily melted.

BURNING of land, called also *burn-beating*, and vulgarly *denfiring*, is a method of preparing and fertilizing lands barren, sour, heathy, and rusty, for corn; by paring off the turf, and drying and *burning* it on the ground.—The same method also obtains for meadows and pasture ground, moist, clayey, or rusty, to improve the hay.

BURNING Mountains. See VOLCANO, EARTHQUAKE, MOUNTAIN, &c.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals. Of these there are various kinds, of various figures; straight, crooked, &c.—Half *burnishers* are used to solder silver, as well as to give a lustre. See SOLDERING.

BURNISHING, the act or art of smoothing, and polishing a metalline body, by briskly rubbing it with a *burnisher*.

Book-binders *burnish* the edges of their books by rubbing them with a dog's tooth. Gold and silver are *burnished* with a wolf's tooth, a dog's tooth, or the blood-stone, or by tripoli, a piece of white wood, emery, and the like.

Deer are said to **BURNISH** their heads, when rubbing off a white downy skin from their horns against a tree, they thrust them, as is said, into a reddish earth, to give them a new colour and lustre.

BURNT-Allum. } See the articles { **ALLUM.**
BURNT-Lead. } **LEAD.**
BURNT-Wine. } **WINE.**
BURROUGH. } **BOROUGH.**

BURR-PUMP, or **BIDGE-PUMP**, a kind of pump so called, because it holds much water. See PUMP.

BURSARS, in Scotland, are youths chosen, and sent as exhibitioners to the universities, one each year, by each presbytery; by whom they are to be subsisted for the space of four years, at the rate of 100 l. *per annum*, Scots.

BURYING. See WOOD.

BUSHEL*, a measure of capacity for things dry; as grains, pulse, dry fruits, &c. containing four pecks, or eight gallons, or one eighth of a quarter.

* Du Cange derives the word from *busellus*, *busellus*, or *bifellus*, a diminutive of *bus*, or *bucca*, used in the corrupt Latin for the same thing: others derive it from *busfalus*, an urn, wherein lots were cast; which seems to be a corruption from *buxulus*.

By 12 H. VII. c. 5. a *busfel* is to contain eight gallons of wheat: the gallon eight pounds of wheat troy-weight: the pound twelve ounces troy-weight: the ounce twenty sterlings; and the sterling thirty-two grains, or corns of wheat growing in the midst of the ear.

At Paris, the *busfel* is divided into two half *busfels*; the half *busfel* into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a sentence of the provost of the merchants of Paris, the *busfel* is to be eight inches, two lines and a half high, and ten inches in diameter; the quart four inches nine lines high, and six inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and a half high, and three inches ten lines in diameter.—Three *busfels* make a minot, six a mine, twelve a septier, and a hundred forty-four a muid.

In other parts of France, the *busfel* varies: fourteen one eighth *busfels* of Amboise and Tours, make the Paris septier. Twenty *busfels* of Avignon, make three Paris septiers. Twenty *busfels* of Blois, make one Paris septier. Two *busfels* of Bourdeaux make one Paris septier. Thirty-two *busfels* of Rochel, make nineteen Paris septiers.

Oats are measured in a double proportion to other grains; so that twenty-four *busfels* of oats make a septier, and 248 a muid. The *busfel* of oats is divided into four picotins, the picotin into two half quarts, or four litrons. For salt, four *busfels* make one minot, and six a septier. For coals, eight *busfels* make one minot, sixteen a mine, and 320 a muid. For lime, three *busfels* make a minot, and forty-eight minots a muid.

BUT

BUSKIN, *Coturnus*, a kind of garment, somewhat in manner of a boot, covering the foot and mid-leg, and tied beneath the knee: very rich and fine, and used principally on the stage by the actors in tragedy.

The *buskin* is said to have been first introduced by Æschylus: it was of a quadrangular form, and might be wore indifferently on either leg. Its sole was made so thick, as by means hereof, men of ordinary stature might be raised to the pitch and elevation of the heroes they personated: in which it was distinguished from the sock, worn in comedy; which was a low, popular shoe.

Dempster observes, that it was not actors alone who wore the *buskin*, but girls likewise used it to raise their height; and travellers and hunters to defend themselves from the mire, &c.

As the *buskin* was the distinguishing mark of tragedy on the stage, we find it in classic authors frequently used to signify *tragedy itself*.

BUST, or **BUSTO**, in sculpture, denotes the figure, or portrait of a person in relief, shewing only the head, shoulders, and stomach: the arms being lopped off; ordinarily placed on a pedestal, or console.

In speaking of an antique, we say the head is marble, and the *busf* porphyry, or bronze, that is, the stomach and shoulders.—Felibien observes, that though in painting, one may say a figure appears in *busfo*; yet it is not properly called a *busf*, that word being confined to things in relief.

The *busf* is the same with what the Latins called *herma*, from the Greek *Hermes*, Mercury; the image of that God being frequently represented in this manner among the Athenians.

BUST is also used, especially by the Italians, for the trunk of an human body, from the neck to the hips.

BUSTIARI, a kind of gladiators, among the ancient Romans, who fought about the bustum, or pile of a deceased person, in the ceremony of his obsequies.

The practice at first was, to sacrifice captives on the tomb, or at the bustum of their warriors: instances of which we have in Homer, at the obsequies of Patroclus, and among the Greek tragedians. Their blood was supposed to appease the infernal Gods; and render them propitious to the manes of the deceased.

In after-ages, this custom appeared too barbarous; and in lieu of these victims, they appointed gladiators to fight; whose blood, it was supposed, might have the same effect.—According to Valerius Maximus and Florus, Marcus and Decius, sons of Brutus, were the first, at Rome, who honoured the funeral of their father with this kind of spectacle, in the year of Rome 489.—Some say, the Romans borrowed this custom from the Hetrurians; and they from the Greeks.

BUSTUM, in antiquity, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt.

The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the *busfum*. The nearest relations lighted it with torches; turning their faces from it, to shew that it was with reluctance they did this last office. After the *busfum* was consumed, the women appointed to collect the ashes enclosed them in an urn, which was deposited in the tomb.

Some authors say, it was only called *busfum*, after the burning, *quasi bene usum*: before the burning it was more properly called *pyra*; during it, *rogus*; and afterwards, *busfum*.

BUTCHER*,—Among the ancient Romans there were three kinds of established *butchers*, viz. two colleges, or companies, composed each of a certain number of citizens, whose office was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. One of these communities, was at first confined to the providing of hogs, whence they were called *suarii*; and the other were charged with cattle, especially oxen; whence they were called *pecuarii*, or *boarii*. Under each of these was a subordinate class, whose office was to kill, prepare, &c. called *lanii*, and sometimes *caruifices*.

* Menage, after Turnebus, derives the word from *buccarius*, of *bucca*, mouth, because the *butcher* kills meat for the mouth: thus also we find him denominated, *buccarius*, from *bucca*, a mouth. Lancelot derives it from the word *Cadurnus*, killer of cattle; Labbe à *bovinæ*, or *bulula carni*.

BUT

Brissonus, Modius, and others, mention a pleasant way of selling meat, used for some ages among this people: the buyer was to shut his eyes, and the seller to hold up some of his fingers; if the buyer guessed aright, how many it was the other held up, he was to fix the price; if he misstook, the seller was to fix it. This custom was abolished by Aponius, prefect of Rome; who in lieu thereof introduced the method of selling by weight.

The French call a place set apart either for the slaughter of cattle, or exposing their flesh to sale, a *butchery*, *boucherie*. The English distinguish; calling the latter a *flesh-shambles*, or *market*, the former a *slaughter-house*.—Nero built a noble edifice of this kind at Rome; on which occasion was struck that medal, whose reverse is a building supported by columns, and entered by a person of four steps; the legend, MAC. AVG. S. C. *Macellum Augusti Senatus-consulto*.

By 1 Jac. 1. c. 22. no *butcher* shall gash, slaughter, or cut any hide of any ox, bull, steer, or cow, in flaying thereof; or otherwise, whereby the same shall be impaired and hurt, on the penalty of 20*d.* for each hide so cut.

No *butcher* shall water any hide, except in June, July, and August; or offer to sale any hide which is putrid and rotten.

No *butcher* shall kill any calf, to sell, being under five weeks old.—Nor use the craft and mystery of a tanner.

BUTLER. See the articles *ARCH-BUTLER*.

BUTLER'S-*Alc.* See the articles *ALC.*

BUTLERAGE of Wines, an imposition on sale wine; brought into the land; which the king's butler, by virtue of his office, may take of every ship, viz. two shillings of every ton imported by strangers.

BUTMENTS*, in architecture, those supporters or props, on, or against which the feet of arches rest.

* The word comes from the French *bouter*, to abut or terminate on any thing; or rather from *buter*, to prop.

The name *butment* is also given to little places taken out of the yard, or the ground-plot of an house, for butteries, sculleries, &c.

BUTT is used for a vessel, or measure of wine, containing two hogsheads, or 126 gallons.—Otherwise called *pipe*.

A butt of currants, is from fifteen to twenty-two hundred weight.

BUTT, or **BUTT-END**, in the sea-language, denotes the end of any plank, which joins to another on the outside of a ship, under water.

Hence, when a plank is loose at one end, they call it *springing a butt*; to prevent which, ships are usually bolted at the *butt heads*, that is, at the plank's end.

BUTTER*, a fact, unctuous substance, prepared, or separated from milk, by heating or churning it.

* The word is formed from the Greek, *Butyros*, a compound of *But* cows, and *ros*, cheese; q. d. cows cheese.—Some authors, out of regard to this etymon, affect to write the word *butyry*, and *butyr*.

The way of making *butter*, in Barbary, is by putting their milk or cream into a goat's skin; suspended from one side of the tent to the other, and pressing it to and fro in one uniform direction. This quickly occasions the necessary separation of the unctuous and wheyey parts. *Shaw. Trav. p. 241.*

It was late ere the Greeks appear to have had any notion of *butter*; Homer, Theocritus, Euripides, and the other poets, make no mention of it; and yet are frequently speaking of milk and cheese: and Aristotle, who has collected abundance of curiosities relating to the other two, is perfectly silent on this. Pliny tells us, that *butter* was a delicate dish among the barbarous nations; and was that which distinguished the rich from the poor.

The Romans used *butter* no otherwise than as a medicine, never as a food. Schookius observes, that it is owing to the industry of the Dutch, that there is any such thing as *butter* in the East-Indies: that in Spain, *butter* is only used medicinally, for ulcers; and adds, that the best opiate for making the teeth white, is the rubbing them with *butter*.

Cl. Alexandrinus observes, that the ancient christians of Egypt burnt *butter* in the lamps at their altars, instead of oil; and the Abyssinians, according to Godignus, still retain a practice much like it: Clemens finds a religious mystery in it.—In the Roman churches, it was

BUT

anciently allowed, during Christmas-time, to use *butter* instead of oil; by reason of the great consumption thereof other ways.

Schookius has a just volume, *de butyro & averse costis*; where the origin and phenomena of *butter* are handled in form: he enquires whether *butter* was known in Abraham's days, and whether it was the dish he entertained the angels with? He examines how it was prepared among the Scythians; whence arise its different colours; teaches how to give it its natural colour; how to churn it, salt it, keep it, &c.

That part of Suffolk called High-Suffolk, being a rich soil, is for a long track of ground wholly employed in dairies; and they again are famous for the best *butter*, and perhaps the worst cheese in England: the *butter* is barrelled, or often pickled up in small casks, and sold, not in London only, but sent even to the West-Indies; from whence, we are told by the British traveller, he has known it to have been brought back to England again, perfectly good and sweet, as at first.

By 13 & 14 Car. II. c. 26. no *butter* which is old or corrupt, shall be mixed or packed with that which is new and found.—Nor any whey-*butter* be mixed or packed with *butter* made of cream.—But each sort shall be packed separately.—No *butter* shall be salted or saved with any great salt, but all with small salt.

BUTTER, *butyrum*, is also used to express several chemical substances—as, *butter* of antimony, of arsenic, of wax, of saturn, &c. on account of their form of consistence, resembling those of *butter*. See *ANTIMONY*, *ARSENIC*, *WAX*, &c.

BUTTING-Pillar. See the article *PILLAR*.

BUTTOCK of a ship is her full breadth right a-stern from the tuck upwards.—According as a ship is built, broad or narrow at the transom, she is said to have a *broad* or *narrow buttock*.

BUTTONS make an article in dress, whose form and use is too familiar to need a description.—The matter whereof they are made is various; as metal, silk, mohair, &c.

Metal BUTTONS are various; both with regard to the matter and manner of making: besides those cast in moulds, much in the manner of other small works, (see *FOUNDERY*) there are now made great quantities with thin plates, or leaves of gold, silver, and brass; especially of the two last.—The invention of these *buttons* being very late, as not having been set on foot before the beginning of the eighteenth century; and their structure very ingenious, though but of indifferent use, we shall here subjoin it.

Manner of making plated BUTTONS. The metal to be used being reduced into thin plates, or leaves, of the thickness intended, (either by the goldsmith or brailer) is cut into little round pieces, of a diameter proportionable to the wooden mould they are to cover: this cutting is performed with a sharp punch, on a leaden block or table.—Each piece of metal thus cut, and taken off from the plate, is reduced to the form of a *button*, by beating it successively in several spherical cavities, with a round piece of iron in form of a punchion; still beginning with the flattest cavity, and proceeding to the more spherical, till the plate have got all the relieve required: and the better to manage so thin a plate, they form ten or twelve to the cavities at once; and also boil the metal to make it more ductile.

The inside thus formed, they give an impression to the outside, by working it with the same iron punchion, in a kind of mould, like the minter's coins, engraven *en creux*; or indented; and fastened to a block or bench. The cavity of this mould, wherein the impression is to be made, is of a diameter and depth suitable to the sort of *button* to be struck in it; each kind requiring a particular mould. Between the punchion and the plate is placed some lead, which contributes to the better taking off all the strokes of the graving; the lead, by reason of its softness, easily giving way to the parts that have relieve; and as easily insinuating itself into the trace, or engraving of the dentures.

The plate thus prepared, makes the upper part or shell of the *button*.—The lower part is formed of another plate; made after the same manner, but flatter, and without any impression. To this last, is soldered a little eye made of wire of the same metal, for the *button* to be fastened by.

The two plates are soldered together, with a wooden mould, covered with wax, or other cement, between; in order to render the *button* firm and solid: for the

B U T

wax entering all the cavities formed by the relievo of the other side, sustains it, prevents its flattening, and preserves its boss or design.—Ordinarily, indeed, they content themselves to cover the naked mould with the shell; and in this case, for the fastening, they pass a thread or gut a-crofs through the middle of the mould.

BUTTRESS, a *butment*, or mass of stone, or brick, serving to prop or support the sides of a building, wall or the like, on the outside; where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c.

The theory and Rules of *buttreffes*, or props for easing walls, are ranked among the desiderata of architecture. See **ARCH**, and **ARC-BOUTANT**.

BUTTRESS, **BUTTRICE**, or **BUTTERIS**, likewise denotes a tool, used by farriers, to pierce the sole of a horse's foot, which is overgrown; to pare the hoof; to fit the shoe, and to cut off the skirts of the sole, that overcast the shoe.

B Y Z

BY-LAWS*, **BYE-LAWS**, or **BI-LAWS**, private or peculiar orders, and regulations for the good government of a city, court, or other community, made by general consent of the members thereof; being not repugnant to the general laws of the realm.

* The word is formed from the Saxon *by*, habitation, vill, and *laga*, *q. d. lex ville*, or town-law.—They are also called *birlaws*, *byrlaws*, and *burlaws*, *bilager*, and *bellagines*.

Such is the custom in Kent of deciding controversies among neighbours about boundaries, by the seneschals, or bailiffs.

In Scotland, those are called *laws of burlaw*, or *byrlaw*, which are made and determined by neighbours, elected by common consent in burlaw-courts; wherein cognizance is taken of complaints betwixt neighbour and neighbour.—

The men thus chosen as judges or arbitrators are called *burlaw-men*, or *byrlaw-men*.

BYZANT. See the article **BEZANT**.

BYZANTIA blatta. See the article **BLATTA**.

There are Visionaries among the Jews, who believe that Jesus Christ wrought his miracles by virtue of the mysteries of the *Cabbala*. Some learned men are of opinion, that Pythagoras and Plato learn'd the *Cabbalistic* art of the Jews in Egypt; and fancy they see evident footsteps thereof in their philosophy: others, on the contrary, say, it was the Philosophy of Pythagoras and Plato, that first furnish'd the Jews with their *Cabbala*. Be this as it will, it is certain that in the first ages of the church, most of the heretics gave into the vain notions of the *Cabbala*: particularly the Gnosticks, Valentinians, and Basilidians. Hence arose the ΑΒΡΑΞΑΣ, and the multitude of talismans, wherewith the Cabinets of the virtuosi were stock'd.

CABINET, or **CABBINET**, the most retired place in the finest apartment of a building; set apart for writing, studying, or preserving any thing very precious.

A complete apartment consists of an hall, antichamber, chamber, and *cabinet*; with a gallery on one side.

CABINS,* or **CABBINS**, in a ship, are small cells, or apartments for the officers of the ship to lie in; very narrow, and in form of armories or presses; used in several parts of the ship, particularly on the quarter deck, and on each side of the steerage.

* The word comes from the French *Cabane*, Spanish *Cabana*, or Italian *Capanna*, a little straw hut; and that from the Greek *καπν*, a stall or manger.

CABIRIA, **KABEIPPIA**, religious feasts held by the antient Greeks of Lemnos, and Thebes, in honour of the Gods *Cabiri*.

These feasts were very antient, and prior even to the time of Jupiter; who is said to have restored them: they were held by night. Children above a certain age were here consecrated; which consecration was supposed to be a preservative against all dangers of the sea, &c.

The ceremony of consecration, called *Σπορσως* or *Σπορσμος*, *q. d.* enthronizing, consisted in placing the initiated youth on a throne, the priests dancing round him: the badge of the initiated was a girdle or scarf.

When a person had committed any murder, the *Cabiria* gave him an asylum.—Meursius is very particular in the proof of each of these points.

CABLE,* a thick long three strand rope, ordinarily of hemp, serving to hold ships firm at anchor, and to tow vessels in large rivers.

* The word *Cable*, comes from the Hebrew word *Chabel*, cord. Du Cange derives it from the Arabic, *Habl*, cord, or *habala*, vincire. Menage, from *Capulum*, or *Cabulum*; and that from the Greek *καυλ*, or the Latin, *Camelus*.

The term *Cable* is sometimes also applied to the cordage used to raise maffy loads, by means of cranes, wheels, and other like engines: though, in strictness, *Cable* is not to be applied to ropes of less than three inches circumference. Every *Cable*, of whatever thickness it be, is composed of three strands; each strand of three twists; and each twist of a certain number of caburns, or threads of rope-yarn, more or less, as the *Cable* is to be thicker or smaller.

To make a *Cable*: after forming the strands, they use flaves; which they first pass between the strands, that they may turn the better, and be intertwisted the more regularly together. And to prevent any entangling, a weight is hung at the end of each strand. The *Cable* being twisted as much as needs, is untwisted again three or four turns, that the rest may the better retain its state.

The number of threads each kind of *Cable* is to be composed of, is always proportioned to its length and thickness; and it is by this number of threads, that its weight and value are ascertained.

A cable of three inches circumference, or 1 inch diameter, consists of 48 ordinary threads, and weighs 192 pounds; one of 10 inches circumference, of 485 threads, and weighs 1940 pounds; a *Cable* of 20 inches, of 1943 threads, and weighs 7772 pounds. The seamen say, The *Cable* is well laid, when it is well wrought, or made.

Serve the *Cable*, or plat the *Cable*, i. e. bind it about with ropes, clouts, &c. to keep it from gauling the haufe.

To splice a *Cable*, is to make two pieces fast together, by working the several strands of the rope one into another.

To coil the *Cable*, is to roll it up round in a ring; of which, the several rolls one upon another are called *Cable tire*.

Pay more *Cable*, that is, let it more out from the ship, that the boat which carries the Anchor may the more easily drop it into the sea.

Pay cheap the *Cable*, that is, put or hand it out apace.

Veer more *Cable*, that is, let more out.

When two *Cables* are spliced together, it is call'd a *shot* of a *Cable*.

Every merchant vessel, how small soever, has three *Cables*, viz. the main or master *Cable*, which is that of the chief anchor; the common *Cable*, and the small one. The ordinary length of the great *Cable*, is 110 or 120 fathoms or braces. Hence, at sea,

CABLE, or **CABLE'S-LENGTH**, is also used for a measure of 120 fathom.

CABLED flutes, in architecture, such flutes as are fill'd up with raised or swelling pieces in form of *Cables*. See **FLUTING**.

CABLED, in heraldry, is applied to a cross formed of the two

ends of a ship's *Cable* — Sometimes also to a cross cover'd over with rounds of rope; more properly called a cross corded.

CABOCHED, **CABOSHED**, or **CABOSSED**, in heraldry, is where the head of a beast is cut off behind the ears, by a section parallel to the face; or by a perpendicular section: in contradistinction to couped; which is done by a horizontal line; besides that it is farther from the ears than *Cabefling*.

CACAO, or **COCOA**, in natural history and commerce, a kind of nut, about the size of a moderate almond; the seed or fruit of a tree of the same name, growing in several parts of the *West-Indies*; chiefly in the provinces of Guatemala and Nicaragua, and in the Caribbe islands.

The native Mexicans call the *Cacao* tree, *Cucubua Guabuilt*; and the Spaniards, *Cacatal*.—It resembles our cherry-tree; but is so very delicate, and the foil it grows in so hot, that to guard it from the sun, they always plant it in the shade of another tree, called mother of *Cacao*.

The fruit is enclosed in a kind of pod, of the size and figure of a cucumber; except that it begins and ends in a point. Within the pod, which is half a finger thick, is form'd a plexus of white fibres, very succulent, a little acid, and good to appease thirst. In the middle of these fibres are contain'd 10, sometimes 12, and sometimes more, as far as forty seeds, of a violet colour, and dry as acorns. Each seed, which is covered with a little bark or rind, when stripped thereof, separates into five or six unequal pieces, in the middle whereof is a kernel having a tender bud, very difficult to preserve.

Of this seed, with the addition of Vanilla, and some other ingredients, the Spaniards, and, after their example, the rest of Europe, prepare a kind of conserve, or cake; which, diluted in hot water, makes that delicious, wholesome drink, called Chocolate: for the preparation, &c. whereof, see **CHOCOLATE**.

This precious fruit, the Spaniards make so considerable a trade of, that there are some who make 5000 l. sterling, *per annum*, from a single garden of *Cacao's*. There are two kinds of *Cacao's*; the most common, which is likewise the best, is of a dark colour, bordering on red, and round: The other is called *Patlaxe*, which is white, larger, thicker, and flatter; its quality is defecative. Some druggists, however, sell four kinds; viz. the great and little *Caracca*, and the great and little *Cacao* of the islands: these, however, may be probably reduced to the two kinds above mentioned: it being only the greatness and smallness that multiplies the names and kinds.

The *Cacao* nuts, are esteemed by the Mexicans as anodyne; and used, eaten raw, to alluage pains of the bowels. They also procure a kind of butter or oil from them, as sweet as that of almonds, and drawn in the same manner; which is excellent for burns.

In some parts of America, the *Cacao* seeds are used by the Indians as money; twelve or fourteen, are esteemed equivalent to a Spanish Real, or six-pence three farthings sterling.

CACHEXY,* *καχεξία*, in medicine, an ill state or disposition of body; wherein the nutrition is deprav'd throughout the whole habit: accompanied with a swelling, or bloating of the fleshy parts; and a paleness and lividness of complexion.

* The word is Greek; formed from *κακος*, ill, and *ἔξις*, habit or disposition.

It ordinarily arises from a debility, or foulness of the stomach or viscera; sometimes from an ulcer in the reins, in persons that have the stone, and other the like causes. The external causes are unwholesome food, frequent drunkenness, excessive study, much waking, suppression of the menfes, immoderate loss of blood, chronic fevers, obstructions, &c.

According to Boerhaave, *Cachexia* may arise either from a vitiated state of the nutritious juice, from some disorder of the vessels that are to receive it, or from a defect in the faculty that should apply it. The juices, he observes, may be depraved, either from the quality of the food; as if it be farinaceous, leguminous, fat, fibrous, sharp, aqueous, or viscid; from the want of motion; from the organs being vitiated by too much weakness, or too much strength: And these, again, may be occasioned by immoderate secretions, and evacuations of any kind, the scirrhus of some of the viscera, or the retention of something that should be secreted: And hence, a diminution of the solids, or a repletion of the liquids with things that cannot pass: Whence arise two notable ill effects of this evil; viz. a leucophlegmatia, and an anasarcaous dropy.

According to the various colour, quantity, tenacity, acrimony, and fluidity of the nutritious liquor, arise also various disorders, as the effects of the *Cachexia*; *v. g.* paleness, yellowness, lividness, greenness, blackness, or redness of the skin; heaviness, windiness, palpitation of the heart and arteries increased with the least motion; crude thin urine; spontaneous watry sweats; and, at length, a leucophlegmatia and dropy. For the vessels that receive the nutritious juice, there cannot well be assigned any universal fault; unless their too great laxity, and the disorders accruing from them, may be admitted as such. Lastly, nutrition is impeded and perverted, by a defect in the faculty that should apply it; as when the circulating force, is either too languid or too violent.

CACHU, **CACHOU**, or **CATECHU**. See the article **CATECHU**. **CACO**.

CAD

CACOCYHMIA *, *Κακοχυμία*, a vicious state of the vital humours, especially of the mass of blood; arising either from a disorder of the secretions, or excretions, or from external contagion.

* The word is Greek; compounded of *κακος*, ill, and *χυμας*, juice.

Gorraeus gives the name *Cacocymia* to the abundance, or excess of any ill humour; whether it be bile, pituita, or whatever, provided there be only one that thus offends in quantity; and *Pluthera* he calls the abundance or excess of all the humours together.

CACOPHONIA *, *Κακοφωνία*, in grammar and rhetoric, the meeting of two letters, or syllables, which yield an uncouth, and disagreeable sound.

* The word is Greek; compounded of *κακος*, evil, and *φωνη*, voice.

CADARI, or **KADARI**, a sect in Mahometanism, who assert free-will, attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination.

The author of this sect was Mased ben Kaled-Al Gihoni, who suffered martyrdom for it. The word comes from the Arabic, *كادر*, *Kadara*, Power. *Ben Am* calls the *Cadarians*, the Magi, or Manichees of the Mussulmen.

CADE, a cag, cask, or barrel; used in the book of rates for a determinate number of some sorts of fish.—Thus a cade of herrings, is a vessel containing the quantity of 500 herrings, and of sprats 1000.

CADENCE, in music, denotes a kind of clofe, or rest, either at the end of a song, or of some of its parts, into which it is divided as into members, or periods.

The word seems a metaphor, drawn from the dancing-school, where it properly signifies a pause, or fall from motion to rest.

A *Cadence* is properly when the parts fall, and terminate on a chord, or note, the ear seeming naturally to expect it. Regularly it is to be made on the final or dominant, though sometimes also on the mediant, or middle chord of a mode.

Cadences in singing answer nearly to points, or stops in discourse.

They are rests contrived to favour the weakness of the performers, as well as the hearers, of a musical composition. Men are not able to sustain their attention, or their voice beyond the space of two measures; even in this short interval we perceive the song to fall, and tend rapidly to a pause, or rest: the notes which introduce these pauses, are called *Cadences*, in the proper conducting and expressing of which a great part of the musicians skill depends.

The chief *Cadence* or clofe is the Key itself, in which the bass must always conclude; the next in dignity is the fifth above, and the next to that the third. Or if the bass be sharp, the fourth or second above the key.

In modulation, *Cadences* are made on several keys, though still with some relation to the principal one; the harmony must always return to the key appropriated to the piece, and often terminate there by middle as well as final *Cadences*.

Cadences usually occur in every two measures, and always in the note which begins the measure they happen in. It requires a nice taste to distinguish the tonic note on which the *Cadence* essentially fall; for that they usually seem to fall on another note presented in the song. It is by the natural progression of the fundamental bass that we are enabled to make the discovery. As often as this bass falls a fifth, or rises a fourth, there is a *Cadence*. In reality, this disposition imitates a clofe so well that when we come to the first found of this *Cadence*, we find ourselves as it were forced to fall on the other, so that it requires an extraordinary effort of the voice to sustain itself on the first, or only to fall a third. Hence it is that the first found which makes its fifth of the tonic is called its dominant, being in reality the top, or highest part of the harmonical system, and that furthest from the fundamental found: Thus *sol* is the dominant of *ut*; and *re*, of *sol*. In making a *Cadence*, the bass must always fall a fifth, or rise a fourth.

CADENCE, in the antient music, denotes a series or succession of musical notes, in certain intervals, which strike the ear agreeably; and especially at the clofe of a song, couplet or stanza. In which sense, *Cadence* amounts to much the same with *Rhythmus*. Some musicians call a shake, a *Cadence*; but that is to confound terms.

CADENCE, in oratory and poetry, denotes the running of verse, or prose; or otherwise called the numbers, and by the antients the *Ποίος*. See **RHYTHMUS**.

CADENCE, in the modern dancing, is when the several steps, and motions follow, or correspond to the notes, or measures of the music.

CADETS, the younger brothers of a family: A term naturalized in our language from the French.

At Paris, among the citizens, the *cadets* have an equal portion with the eldest: In other places, the eldest has all. According to the custom of Spain, one of the *Cadets*, in great families, takes the mother's name.

CADET also denotes a young gentleman soldier, who to attain to some knowledge in the art of war, and in expectation of preferment, chuses to carry arms as a private man in a company of Foot.

Cadet differs from volunteer, as the former takes pay, though

CÆM

only that of a private man, whereas the latter serves without pay.

Formerly there were only allowed two *Cadets* in each company. In 1682, the king of France established companies of *Cadets*, wherein the young gentry were trained up to war, and taught the arts and exercises belonging thereto, as riding, fencing, mathematics, &c.

CADI *, among the Turks and Saracens, denotes an ordinary judge, who decides in all civil controversies within the district of a town, or city, though subject to appeals to superior judges.

* The word is Arabic *قاضي* or *قاضي*, *Cadi*, *q. d.* judge, formed of *ق* to judge. d'Herbelot writes it *Cadi*.

The term *Cadi* used absolutely, denotes the judge of a smaller town or village; those of cities being called *Mollas*, or *Mouias*, sometimes *Mouli-Cadis*, or great *Cadis*.

CADILESCHER, or **CADI-LESKER** *, a capital officer of justice among the Turks, answering to a chief justice among us.

* The word comes from the Arabic *Kadi*, judge, the particle *Al*, and *Aschar*, army; as being at their first institution, chiefly judges of the soldiery: Of whose causes they have still the sole cognizance. d'Herbelot writes the name *Cadbi-lesker*, or *Cadbi-asker*.

Each *Cadilescher* has his particular district: d'Herbelot makes two *Cadileschers* in the empire; Rycaut adds a third: with him the *Cadilescher* of Europe, or Romania is the first; that of Asia, or Anatolia the second; and that of Egypt the third.

CADIZADELITES, a sect among the Mussulmen. The *Cadizadelites* are a kind of stoics, who avoid all feasting and diversion, and affect an uncommon gravity in all they do or say.

Those of them who inhabit the frontiers of Hungary, &c. agree in many things with the christians; and drink wine, even in the fast of the Ramazan.

They read the Slavonic translation of the Bible, as well as the Alcoran. Mahomet, according to them, is the Holy Ghost, which descended on the apostles at the feast of pentecost.

CADμία, in pharmacy, a mineral substance, whereof there are two kinds, *natural* and *artificial*.

The *natural Cadmia*, again, is of two sorts; the one containing arsenick, and called cobalt; the other containing zink, called calamine, or lapis calaminaris.

The *artificial cadmia* is prepared from copper, in furnaces: Of this there are five kinds; the first called *botryitis*, as being in form of a bunch of grapes; the second, *gyracitis*, as resembling a Sea-shell; the third, *placitis*, because resembling a crust; the fourth, *capnitis*, dusty; and the fifth, *calamitis*: This last hangs round certain iron rods, wherewith the matter of the copper is stirred in the furnace, which being shaken off, bears the figure of a quill, called in latin *calamus*.

The *Cadmia Botryitis* is found in the middle of the furnace; the *gyracitis* at the bottom; the *placitis* at the top; and the *capnitis* at the mouth of the furnace.

This *Cadmia* is desiccative and deterfive, it is generally used in sinking ulcers; which by means hereof are brought to cicatrize. The *botryitis* and *placitis*, are also good in diseases of the eyes. See **Supplement, Article: CALAMINARIS** and **COBALT**.

CADRITES, a kind of religious among the mahometans; whose founder was Abdul Cadri, a great philosopher and lawyer; whence they fetch their name, *Cadrites*.

They live in common, and in a kind of monasteries; which, however, they are allowed to quit, if they request it, and to marry; on condition of their wearing black buttons on their garments, to distinguish them from the rest of the people.

In their monasteries, each Friday, they pass the greatest part of the night in running round, holding each others hand, and crying incessantly *haur*, living, one of the names of God: One of their number plays all the time on a flute, to animate them in this extravagant dance.

CADUCEUS, or **CADUCEUM**, Mercury's rod, or sceptre; a wand entwisted with two serpents, born by that Deity as the ensign of his quality and office.

The poets attribute wondrous virtues to the *Caduceus*; as that of throwing people into a sleep, raising the dead, &c. It was also used by the antients as a symbol of peace, and concord: The Romans sent the Carthaginians a javelin and a *Caduceus*, offering them their choice, whether of war or peace.

Among that people, those who denounced war were called *sciales*, and those who went to demand peace, *Caduceatores*; because they bore a *Caduceus* in their hand.

The *Caduceus* found on medals, is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

CADUCUS morbus, in medicine; see the article **EPILEPSY**.

CÆCUM, in anatomy. See the article **COECUM**.

CÆMENT, in a general sense, any composition of a glutinous, or tenacious nature, proper to bind, unite, or keep things in cohesion.

The word is also written *Cement*, and even *Cimēt*. It is formed from the latin *cementum*, of *cado*, I beat. — Tho' M. Feli-lien observes, what the ancient architects call'd *Cementum*, was a very different thing from our *Cement*. The name *Cement*, with

with them, stood for a kind of masonry, or manner of laying the stones; and even for the quality of the stones; as when the walls were built of rude, unequal stones. In reality, the stones were cut for such work, but not squared nor uniform: So that *Cæmenta* stood opposed to *quadrati lapides*.

Mortar, folder, glue, &c. are *Cements*. The Bitumen brought from the Levant, is said to have been the *Cement* used in the walls of Babylon. See *BITUMEN*.

Equal quantities of powder'd glass, sea-salt and iron filings, mixed with loam, make one of the hardest and most durable *Cements* that is known. The juice of garlic, M. Perrault affirms us, is a *Cement* for broken glass and china ware.

CEMENT, is particularly used in architecture, for a strong, binding sort of mortar, used to bind, or unite bricks or stones together, for some kinds of mouldings; or to make a block of bricks, for the carving of scrolls, capitals, &c.

It is of two sorts: The *hot Cement*, which is the most common, is made of rosin, bees-wax, brickduft, and chalk, boiled together. The bricks to be *cemented* are heated, and rubbed one upon another, with *Cement* between.

The *cold Cement* is less used; it is made of cheshire cheese, milk, quick lime, and whites of eggs.

CEMENT, is also used among goldsmiths, engravers, jewellers, &c. for a composition of fine brickduft, well sifted, rosin, and bees-wax; in use among those artificers to keep the metals to be engraven, or wrought on, firm to the block, &c. as also to fill up what is to be chiselled.

CEMENT, in chemistry, is a compound mass, or saline powder, used for the purifying of gold, and consuming the impurer metals mix'd therewith.

CEMENTS are prepared of such salts and other ingredients, as by their acrimony corrode and separate the silver, copper, or other matters from the body of gold. Some authors make but two kinds of *Cements*, *common* and *royal*. The first made of brickduft, nitre, and verdigrease; the second of sal gemmæ and armoniac, each one part; two parts of common salt, and four of bole; the whole reduced into a paste with urine. But many other compositions are given by le Mort, le Febvre and others. Paracelsus has a book express on the several kinds of *Cements*. See *Supplement*, article *CEMENT*.

CEMENTATION, a manner of purifying gold from other metals, by means of *Cement*.

It is performed thus: Thin plates, or laminae, are stratified in a crucible with the royal *cement*; the crucible is cover'd up, and encompassed with fire for 10 or 12 hours, till being thus calcined, the salts have imbibed and consumed the impurities of the gold. This method of refining is much inferior to that by means of antimony; in regard, the salts, if not sufficiently corrosive, leave other metals remaining with the gold; and if too corrosive and acrimonious, they frequently eat away the gold itself. See *REFINING*.

CÆSAR, among the Romans, was a long time used for the heir intended, or presumptive of the empire; as king of the Romans is now used for that of the German empire.

Thus Constantius Chlorus, and Galerius, were proclaimed *Cæsars* by Diocletian and Maximian; Licinius by Galerius; Constantine the great, by Constantius; Constantine the younger, Constantius and Constant, by their father Constantine; and Junius Gallus and Julian, by Constantius.

The *Cæsars* were a kind of adjuncts or associates of the empire, *Participes imperii*. They wore the imperial mantle, purple, and diadem, and walked with other marks of the sovereign dignity: They were created like the emperors, by putting on the purple robe.

The dignity of *Cæsar* remained the second of the empire, till Alexius Comnenus having erected Nicephorus Melissenus *Cæsar* by contract; and it being necessary to confer some higher dignity on his own brother Isaacus, he created him Sebastocrator, with the precedence over Melissenus, ordering that in all acclamations, &c. Isaacus Sebastocrator should be named the second, and Melissenus *Cæsar*, the third.

The title took its rise from the cognomen, or surname of the first emperor, C. Julius *Cæsar*, which by a decree of the Senate all the succeeding emperors were to bear. Under his successor, the appellation Augustus being appropriated to the emperors, in complement to that prince, the title *Cæsar* was given to the second person in the empire, though it still continued also to be given to the first: And hence the difference between *Cæsar* used simply, and *Cæsar* with the addition of Imperator Augustus.

Authors are divided as to the origin of the word *Cæsar*, the cognomen of the Gens Julia: Some after Servius, derive it from *Cæsaries*, head of hair; urging, that the first who bore it, was distinguished by his fine head of hair, which occasioned the title. The more common opinion is, that the word *Cæsar* comes à *cæso matris Utero*; because his mother's womb was cut open to give him birth.

Others derive it from hence, that the first who bore the name killed an elephant in battle, à *Cæso Elephante*, which in the Mauritanian tongue is called *Cæsar*. This opinion Bircherodius supports on the credit of an ancient medal, whereon is seen an elephant with the word *CÆSAR*.

CÆSARIAN Section, the operation of extracting the Fœtus from the mother, whether living or dead, by an incision through the abdomen into the Uterus. See *DELIVERY*, &c.

This is sometimes also denominated the *Cæsarian* birth, Partus *Cæsareus*; by the Greeks, *ὀσσευτομικη*, or *καρποτομία*.

It appears from experience, that wounds in the muscles of the Epigastrium, or Peritonæum, and those in the matrix, are not mortal; so that the belly of the mother may be sometimes opened to give passage for the child: But then it is not without great danger; on which account, this operation is very rarely practised, except on women newly dead. Those brought into the world in this manner, are called *Cæsareis*, and *Cæsines*, à *cæso matris Utero*; as were C. Julius Cæsar, Scipio Africanus, Manilius, and our Edward 6.

*CÆSTUS**, a large leathern gantlet, loaded with lead, used in the combats, or exercises of the ancient Athlete.

* It was called *Cæstus*, à *cædendo*, from *cædo* to strike, or beat.

Calepine says, it was a kind of a club with leaden balls hanging from it, suspended by leathern thongs; But he was mistaken, it being only a leathern thong fluffed with nails of lead or iron; part of it was twisted round the hand and arm, to prevent their being broke or dislocated.

CÆSURA, in the ancient poetry, is when in the scanning of a verse, a word is divided, so as one part seems cut off, and goes to a different foot from the rest, *e. gr.*

Menti | ri no | li num | quam men | dacia profunt.

Where the Syllables *ri*, *li*, *quam*, and *men* are *Cæsures*.

CÆSURA, more properly denotes a certain agreeable division of the words, between the feet of a verse; whereby the last syllable of a word becomes the first of a foot.

As in—*arma virum; Cano Troje qui primus ab oris.*

where the syllables *no* and *jæ* are *Cæsures*.

CÆSURA, in the modern poetry, denotes a rest, or pause towards the middle of a long Alexandrine verse; by which the voice and pronunciation are aided, and the verse as it were divided into two hemistichs.

In Alexandrine verses, of 12 or 13 syllables, the *Cæsura* must always be on the sixth; in verses of 10 on the fourth; and in those of 12 on the sixth: Verses of eight syllables must not have any *Cæsura*.

CÆTERIS Paribus, a latin term, in frequent use among mathematical, and physical writers.

The words literally signify, *the rest, or the other things being alike, or equal*; which expresses pretty nearly their meaning as a term.

Thus, we say, the heavier the bullet, *cæteris paribus*, the greater the range, *i. e.* by how much the bullet is heavier, if the length and diameter of the piece, and the quantity and strength of the powder be the same, by so much will the utmost range or distance of Carriage of a piece of ordnance be greater.

Thus also, in a physical way, we say, the velocity and quantity of blood circulating in a given time, through any section of an artery, will, *cæteris paribus*, be according to its diameter, and nearness to, or distance from the heart.

*CAIMACAN**, or *CAIMACAM*, a dignity in the Ottoman empire, answering to that of lieutenant, or vicar among us.

* The word is composed of the two Arabic words, *Caim* *marbum*, *q. d.* he who holds the place, or discharges the function of another.

There are usually two *Caimacans*; one resides at Constantinople, who is the governor thereof: the other attending the grand vizir, in quality of his lieutenant.—Sometimes there are three *Caimacans*; one constantly attending the grand signior, another the grand vizir, and a third constantly at Constantinople; who examines affairs of policy, and regulates them in great measure.

The *Caimacan* that attends the vizir, only officiates when at a distance from the grand signior; his function ceasing, when the vizir is with the sultan. The *Caimacan* of the vizir is his secretary of state, and the first minister of his council.

CAINITES, or *CAINIANS*, a sect of ancient heretics, who paid extraordinary honours to those persons represented in scripture as the worst of mankind; so called from Cain, whom they esteemed their patriarch, and the chief object of their veneration. The *Cainites* were a branch of the gnostics: they held, that Cain and Eïau, Lot, and those of Sodom, were born of a most eminent celestial virtue; that Abel, on the contrary, was born of a virtue much less eminent: to Cain, and others of the same order, who, according to them, had a mighty knowledge of all things, they associated Judas, whom they held in so much esteem, that they had a book among them called the gospel of Judas. S. Epiphanius relates, and at the same time relates, their errors.

CALAMINARIS Lapis, *CALAMIN Stone*, a kind of fossil of some use in medicine, but of more in foundry; being used to make copper yellow, *i. e.* to convert it into brass. It is either of a brownish colour, as that of Germany, and England; or reddish, as that about Liege, and in some parts of France; which is accounted the best, because turning yellow by calcination. It is dug out of mines, usually in small pieces; having always eyes, sometimes veins, of lead in it; though it be not always found in lead-mines.—We have mines of *Calamin* at Wrington in Somersetshire, and elsewhere. It is generally dug in barren rocky ground; its courses running, usually, at 6 o'clock, as they call

call it, *i.e.* from east to west; sometimes at 9, and sometimes at 12; or perpendicular, which is accounted the best.

When dug, it is washed, or budded, as they call it, in a running water, which carries off the impure and earthy parts; leaving the lead, *Calamine*, and sparry parts at bottom: They then put it in a sieve, and shaking it well in water, the lead mixed with it links to the bottom, the sparry parts get to the top, and the *Calamine* lies in the middle: Thus prepared, they bake it in an oven four or five hours; the flame being so contrived as to pass over, and so to heat and bake the *Calamine*; stirring and turning it all the while with iron rakes. This done, they beat it to powder and sift it; picking out of it what stones they find: And thus it is fit for use.

For the manner of applying *Calamine* in the preparation of Brass: See BRASS.

Besides the two natural *Calamines*, this and Cohalt, there are two artificial ones: The best is that called *pempholyx*, the other *tutty*. *Calamine* is of some medicinal virtue, being astringent, desiccative, and detergent; and is much used for taking off films from the eyes of horses, &c. See Supplement, article CALAMINARIS.

CALAMITA, in pharmacy, a term sometimes used for styrax, because antiently put up in canes, *Calami*, to preserve it. See Supplement, article CALAMITA.

CALAMUS Aromaticus, in pharmacy, a spicy, bitterish root, produced by a peculiar kind of water plant, growing in the Levant, and even in several parts of England; it is about the thickness of a goose-quill, and is much used as a cephalic, and stomachic; especially against complaints arising from a cold, weak stomach.

The *Calamus Aromaticus* is the same with what is otherwise denominated *Acorus*.

It is also called *Calamus odoratus*, and *Calamus amarus*; sometimes *Calamus verrus*, or *officinalis*, to distinguish it from another sort called *adulterinus*: In English, it is called the *sweet cane*, or *sweet smelling flag*.

The best is that which is greyish without and reddish within, its pulp white, and taste somewhat bitter; but its leaves as well as roots, sweet-scented.

CALAMUS Scriptorius, in anatomy, is a dilatation of the fourth ventricle of the brain; so called from its figure, which resembles that of a quill. See BRAIN.

CALATRAVA, a military order, instituted in 1158, by Sancho III. king of Castile, on the following occasion: The Moors going to attack the little city *Calatrava*, and the templars who held it, surrendering it up to the king, on a supposition of their inability to defend it, Diego Velasquez, a Cistercian monk, but a man of quality, persuaded Raimond abbot of Fitero, a monastery of Cistercians, to beg *Calatrava* of the king. He obtained it; and Raimond and Diego put themselves in it; being followed by a great number of people who joined them out zeal, for the defence of *Calatrava*. The Moors abandoning the enterprize, many of those who came to the defence of the city, entered the order of the Cistercians; and that under a habit more fit for military than monastic exercises. Accordingly they began to make excursions on the Moors; and this was the rise of the order of *Calatrava*.

The first grand master was Garcias; under whose government the order was confirmed by Alexander III. in 1164. In 1489, Ferdinand and Isabella, with the consent of pope Innocent VIII. reunited the grand mastership of *Calatrava* to the Spanish crown: So that the kings of Spain are now become perpetual administrators thereof.

The knights bear a cross gules, fleury with green, &c. Their rule and habit was originally that of the Cistercians; but their dress was a little shortened on account of their exercises: And in process of time they were permitted a secular habit.

CALCANEUM, or CALCANEUS, in anatomy, the same as Calx, Os Calcis, Calcari, or the heel-bone.

It lies under the astragalus, to which it is articulated by ginglimus; behind it is a large protuberance, which makes the heel, and into which the Tendo Achillis is inserted.

CALCANTHUM, in mineralogy, see the article CHALCANTHUM.

CALCEDONY*, *Lapis CALCEDONIUS*, one of the lowest prized among precious stones; diversified with various colours, partly transparent, and partly opaque.

* Salmasius derives the word by corruption from *Carchedonius*; taking the modern *Calcedony* to be the same with the *Lapis Carchedonius* of the antients.

The *Calcedony*, or *Calcidony*, nearly resembles the common agate, and is reputed a species thereof: Its colour is a milky grey, clouded with blue, yellow, or purple. It is supposed to be the white agate of the antients; though we sometimes find pieces of it blackish.

It is very fit for the graver; and much used, either to engrave arms, &c. upon, as being harder and preferable to crystal, if good; or to paint them on the backside. In some parts, vases, cups, religious beads, &c. are made thereof. The clearest and best is that with a pale cast of blue.

Belonius says, it is so common among the Turks, that it serves them for threshing their corn; but he seems to be mistaken.

Neri shews how to make artificial *Calcedonies* of the colour of agate and oriental jaspers. See Supplement, article CHALCEDONY.

CALCEDONIUS is also a term used by the jewellers, for a defect in some precious stones; when, in turning them, they find white spots, or stains, like those of the *Calcedony*.

This defect is frequent in granates and rubies. The Lapidaries usually remedy it by hollowing the bottom of the stone.

CALCINATION, the act of calcining any matter; *i.e.* of reducing it into a calx, or very subtil white powder, by fire.

Calcination, sometimes also called *chemical Pulverization*, is the next degree of the power of fire beyond that of fusion: For when fusion is longer continued, not only the more subtil particles of the body itself fly off, but the particles of fire do likewise insinuate themselves in such multitudes, and are so dispersed and blended throughout its whole substance, that the fluidity which was first caused by the fire, can no longer subsist. From this union arises a third kind of body, which being very porous and brittle, is easily reduced to powder. For the fire having penetrated every where into the pores of the body, the particles are both hindered from mutual contact, and divided into minute atoms; so that they are easily reducible into the finest powder.

CALCINATION, in a more extensive sense, includes also the solution of metalline bodies by corrosive matters.

In this sense, *Calcination* is divided into *actual*, and *potential*.

Actual CALCINATION, is that effected by actual fire, of wood, coals, or other fuel, raised to a certain heat, according to the nature of the substance to be calcined.

Actual Calcination, is subdivided into *incineration*, and *reverberation*; to this head also belongs the *extinction* of things ignited.

Potential CALCINATION, is that procured by potential fire, *viz.* by salts, sulphurs and other drugs, which have, as it were, the force of fire; as strong waters, corrosive spirits, &c.

Gold is calcined by a reverberatory fire, with mercury, and sal armoniac. Silver with common salt and alkali salt. Copper with salt and sulphur; iron with sal armoniac and vinegar; tin with antimony, lead and sulphur; mercury with aqua fortis: This last also, as well as most other minerals, calcines with fire alone, without any other ingredient. See Supplement, article CALCINATION.

CALCULATION, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See ARITHMETIC.

An error in *Calculation* is never protected or secured by any sentence, decree, &c. In stating accounts there is always understood, *salvo errore calculi*.

The word *Calculus* is used in this sense, in allusion to the practice of the antients, who used *Calculi* or little stones, in making computations, in taking suffrages, and in keeping accounts, &c. as we now use counters, figures, &c.

CALCULATION is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the times of eclipses, &c.

CALCULATION of Clock and Watch-work. See CLOCK and WATCH-WORK.

CALCULUS*, in medicine, the disease of the stone in the bladder, or kidneys.

* The term is pure latin, and signifies, literally, a little pebble.

The *Calculus* in the bladder is called *Lithiasis*; and in the kidneys, *Nephritis*.

CALCULUS Literalis, or Literal CALCULUS, is the same with specious arithmetick; so called, from its using the letters of the alphabet: In contradistinction to numeral arithmetic, which uses figures.

In the literal *Calculus*, given quantities are expressed by the first letters, *a b c d*; and quantities sought by the last *z y x*, &c. Equal quantities are denoted by the same letters.

CALCULUS Differentialis, is a method of differencing quantities; or of finding an infinitely small quantity, which being taken infinite times, shall be equal to a given quantity: Or, it is the arithmetick of the infinitely small differences of variable quantities.

The foundation of this *Calculus*, is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one; and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one, *i.e.* less than nothing. Hence two quantities, only differing by an infinitesimal, are reputed equal.

The better to conceive the nature of an infinitesimal, suppose, that in measuring the height of a mountain, while you are looking through the sights, the wind blows off the smallest grain of dust; the height of the mountain is, then, less by the diameter of the dust than before: But as the mountain is still found of the same height, whether the dust be there or not, its diameter has nothing to do in the present case; and passes for nothing, *i.e.* is infinitely small. Thus, in astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars: And the same holds in abstract quantities.

ities. The name infinitesimal, therefore, is merely respectful, and involves a relation to another quantity; and does not denote any real ens or being.

Now infinitesimals are called *differentials*, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them *moments*; considering them as the momentary increments of quantities; v.g. of a line generated by the flux of a point; or of a surface by the flux of a line.

The *differential Calculus*, therefore, and the doctrine of fluxions are the same thing under different names; the former, given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lay claim to the discovery.

There is, indeed, a difference in the manner of expressing the quantities, resulting from the different views wherein the two authors consider the infinitesimals; the one as moments, the other as differences: Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter *d*; thus the differential of *x* is called *dx*; and that of *y*, *dy*: Now *dx* is a positive quantity, if *x* continually increase; negative if it decrease.

The English, with Sir Isaac Newton, instead of *dx*, write *·x* (with a dot over it) for *dy*, &c. which foreigners object against, on account of that confusion of points, which they imagine arises, when differentials are again differenced; besides, that the printers are more apt to overlook a point than a letter.

Stable quantities being always expressed by the first letters of the alphabet *da = a*, *db = a*, *dc = a*; wherefore *d(x + y - a) = dx + dy*, and *d(x - y + a) dx - dy*. So that the differencing of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being *xy*, the differential will be *xdy + ydx*, i.e. *d(xy) = xdy + ydx*. Secondly, if there be three quantities mutually multiplying each other, the fluxion of the two must then be multiplied into the differential of the third: thus, suppose *oxy*, let *vx = z*, then *oxy = ty*; consequently *d(vxy) = tdy + ydt*: But *dt = vdx + xdv*. These values, therefore, being substituted in the antecedent differential, *t dy + y dt*, the result is *d(vxy) = v x dy + vy dx + xy dv*. Hence it is easy to apprehend how to proceed, where the quantities are more than three.

If one variable quantity increase, while the other *y* decreases, it is evident *ydx - xdy* will be the differential of *xy*.

To difference quantities that mutually divide each other: The rule is, first, multiply the differential of the divisor into the dividend, and, on the contrary, the differential of the dividend into the divisor; subtract the last product from the first, and divide the remainder by the square of the divisor; the quotient is the differential of the quantities mutually dividing each other. See FLUXIONS.

CALCULUS Integrals, or *Summatorius*, is a method of integrating, or summing up moments, or differential quantities; i.e. from a differential quantity given, to find the quantity from whose differencing the given differential results.

The *integral Calculus* therefore, is the inverse of the differential one: Whence the English, who usually call the differential method, *fluxions*, give this *Calculus*, which ascends from the fluxions, to the flowing or variable quantities; or, as foreigners express it, from the differences to the sums; by the name of the *inverse method of fluxions*. See FLUXIONS.

Hence, the integration is known to be justly performed, if the quantity found according to the rules of the *differential Calculus*, being differenced, produce that proposed to be summed. See **SUMMATORY Calculus**.

Suppose *f* the sign of the sum, or integral quantity; then *fydx* will denote the sum, or integral of the differential *fydx*. To integrate, or sum up a differential quantity: It is demonstrated, first, that *fdx = x*: Secondly, *f(dx + dy) = x + y*; thirdly, *f(xdy + ydx) = xy*; fourthly, *f(mx^{m-1}dx = x^m) = x^m*; fifthly, *f(n:m)x(n-m):mdx = x^{n:m}*; sixthly, *f(ydx - xdy):y² = x:y*. Of these the fourth and fifth cases are the most frequent; wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v.g. the fourth case, by *m - (1 + 1) dx*, i.e. by *mdx*.

If the differential quantity to be integrated, do not come under any of these formula's, it must either be reduced to an integrable finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power; but *vice versa*, the root cannot be extracted out of any number required: So in the analysis of infinites, any variable or flowing quantity may be differenced; but, *vice versa*, any differential cannot be integrated.

And as in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations; so neither has the *integral calculus* arrived at its perfection: And as in the

former we are obliged to have recourse to approximation; so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration. See SERIES.

CALCULUS Exponentialis, is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, is here understood a power, whose exponent is variable; v.g. *x^a a^x x^x*, where the exponent *x* does not denote the same in all the points of a curve, but in some stands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity: there is nothing required but to reduce the exponential quantities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities:—Thus, suppose the differential of the exponential quantity *xy* required, let

$$\frac{x}{x} = z$$

Then will $y \log x = \log z$

$$\log x dy + y dx = x dz : z$$

$$z \log x dy + y dx : x dz :: z$$

$$\text{That is, } x^y \log x dy + y x^{y-1} dx = dz$$

CALEFACTION, a school term for the action of fire in heating a body: or the impulse which the particles of a hot body impress on other bodies around.

The word is particularly used in pharmacy; where *calefaction* is distinguished from *coction*; the first being applied, where the thing is only heated without boiling.

CALENDAR*, **CALENDARIUM**, a distribution of time, accommodated to the uses of life; or a table, or almanack, containing the order of days, weeks, months, feasts, &c. happening throughout the year. See TIME, YEAR, MONTH, FEAST, &c.

* It is called *Calendar* from the word *Calends*, antiently wrote in large characters at the head of each month. See CALEND.

The *Roman Calendar*, which continues still in use, owes its origin to Romulus; but it has undergone various reformations since his time. That legislator distributed time into several periods, for the use of the people under his command: But as he was much better versed in matters of war than of astronomy, he only divided the year into ten months; making it begin in the spring, on the first of March; imagining the sun made his course thro' all the seasons in three hundred and four days.

Romulus's *Calendar* was reformed by Numa, who added two more months, January and February, placing them before March: So that his year consisted of three hundred fifty-five days, and begun on the first of January. He chose, however, in imitation of the Greeks, to make an intercalation of forty-five days, which he divided into two parts; intercalating a month of twenty-two days at the end of each two years; and at the end of each two years more, another month of twenty-three days; which month, thus interposed, he called *Marcedonius*, or the intercalary February.

But these intercalations being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year; which Cæsar, as sovereign pontiff, endeavoured to remedy: To this end he made choice of Sotigenes, a celebrated astronomer of those times; who found, that the dispensation of time in the *Calendar*, could never be settled on any sure footing, without having regard to the annual course of the sun. Accordingly, as the sun's yearly course is performed in three hundred sixty-five days six hours, he reduced the year to the same number of days: The year of this correction of the *Calendar*, was a year of confusion; they being obliged, in order to swallow up the sixty-five days that had been imprudently added, and which occasioned the confusion, to add two months besides the *Marcedonius*, which chanced to fall out that year; so that this year consisted of fifteen months, or four hundred forty-five days. This reformation was made in the year of Rome 708; forty-two or forty-three years before Christ.

The *Roman*, called also *Julian Calendar*, from its reformer Julius, is disposed into quadriennial periods; whereof the three first years, which he called *Communes*, consist of three hundred sixty-five days; and the fourth, *Bissextile*, of three hundred sixty-six; by reason of the six hours, which in four years make a day, or somewhat less; for in one hundred thirty-four years, an intercalary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciacconius, appointed that the hundredth year of each century should have no bissextile, excepting each fourth century: That is, a subtraction is made of three bissextile days in the space of four centuries; by reason of the eleven minutes wanting in the six hours whereof the bissextile consists. See BISSEXTILE. This reformation of the *Calendar*, or the new stile, as we call it, commenced on the fourth of October, 1582, when ten days were thrown out at once; so many having crept into

into the computation since the time of the council of Nice, in 325; by the defect of eleven minutes.

Julian Christian CALENDAR, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the paschal full moon, with the feast of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See **GOLDEN NUMBER**.

In this *Calendar*, the vernal equinox is supposed to be fixed to the 21st day of March; and the cycle of 19 years, or the golden numbers, constantly to indicate the places of the new and full moons: yet both are erroneous. And hence arose a very great irregularity in the time of Easter. To shew this error the more apparently, let us apply it to the year 1715: in this year, then, the vernal equinox falls on the 10th of March; and therefore comes too early by 11 days. The paschal full moon falls on the 7th of April; and therefore too late, with regard to the cycle, by three days. Easter, therefore, which should be on the 10th of April, will be that year on the 17th. The error, here, lies only in the metempepsis, or post-position of the moon, through the defect of the lunar cycle. If the full moon had fell on the 11th of March, Easter would have fallen on the 13th of March: and therefore the error arising from the anticipation of the equinox, would have exceedingly augmented that arising from the post-position. These errors, in course of time, were so multiplied, that the *Calendar* no longer exhibited any regular Easter. Pope Gregory XIII. therefore, by the advice of Aloysius Lilius, in 1582, threw 10 days out of the month of October, to restore the equinox to its place, viz. the 21st of March; and thus introduced the form of the Gregorian year, with such a provision, as that the equinox should be constantly kept to the 21st of March. The new moons and full moons, by advice of the same Lilius, were not to be indicated by golden numbers, but by epacts. The *Calendar* however is still retained in England, without this correction. Whence there is a difference of 11 days between our time and that of our neighbours.

GREGORIAN CALENDAR, is that, which by means of epacts rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year.

The Gregorian *Calendar* therefore differs from the Julian, both in the form of the year, and in that epacts are substituted in lieu of golden numbers: for the use and disposition whereof, see **EPACT**.

Though the Gregorian *Calendar* be preferable to the Julian, yet is it not without its defects: (perhaps, as Tycho Brahe and Cassini imagine, it is impossible ever to bring the thing to a perfect justness.) For, first, the Gregorian intercalation does not hinder, but that the equinox sometimes lags behind the 21st of March, as far as the 23d, and sometimes anticipates it, falling on the 19th: and the full moon, which falls on the 20th of March, is sometimes the paschal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March, the paschal; which yet, falling before the equinox, is not paschal. In the first case therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true ones by some hours; the paschal full moon may fall on Saturday, which is yet referred by the cycle to Sunday; whence, in the first case, Easter is celebrated eight days later than it should be; in the other it is celebrated on the very day of the full moon, with the Jews and Quartodeciman heretics; contrary to the decree of the council of Nice. Scaliger, and Calvisius, shew other faults in the Gregorian *Calendar*; arising from the negligence and inadvertency of the authors. Yet is this *Calendar* adhered to by the Romanists, throughout Europe, &c. and used wherever the Roman breviary is used.

Reformed, or Corrected CALENDAR, that which setting aside all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paschal full moon, and the moveable feasts depending thereon, by astronomical computation, according to the Rudolphine tables.

This *Calendar* was introduced among the protestant states of Germany, in the year 1700; when 11 days were at once thrown out of the month of February: so that in 1700, February had but 18 days: by this means, the corrected stile agrees with the Gregorian. This alteration in the form of the year they admitted for a time; in expectation that the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them, on some more convenient intercalation.

Construction of a CALENDAR, or Almanack. 1^o. Compute the sun's and moon's place for each day of the year; or take them from Ephemerides. 2^o. Find the dominical letter, and by means thereof, distribute the *Calendar* into weeks. 3^o. Compute the time of Easter, and thence fix the other moveable feasts. 4^o. Add the immoveable feasts, with the names of the martyrs.

5^o. To every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the crepuscula, and the aspects of the planets. 6^o. Add, in the proper places, the chief phases of the moon. And the sun's entrance into the cardinal points; i. e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets, and chief fixed stars. Means for each whereof, will be found under the proper heads.

The duration of the crepuscula, or the end of the evening, and beginning of the morning twilight; together with the sun's rising and setting, and the length of days, may be transferred from the *Calendar*; of one year, into those of another: the differences in the several years being too small to be of any consideration in civil life.

Hence it appears, that the construction of a *Calendar* has nothing in it of mystery, or difficulty; if tables of the heavenly motions be but at hand.

Geleleian CALENDAR, is a correction of the Persian *Calendar*, made by order of sultan Geleleddan, in the 467th year of the Hegira: of Christ 1389.

CALENDAR, is also used for the catalogue, or fasti, antiently kept in each church, of the saints, both universal, and those particularly honoured in each church; with their bishops, martyrs, &c. *Calendars*, are not to be confounded with martyrologies: for each church had its peculiar *Calendar*; whereas the martyrologies regarded the whole church in general: containing the martyrs and confessors of all the Churches. From all the several *Calendars* was formed one martyrology: so that martyrologies are posterior to *Calendars*. See **MARTYROLOGY**.

There are still some of these *Calendars* extant; particularly a very antient one of the church of Rome, made about the middle of the IVth century: comprehending also the festivals both of the heathens and christians, which were then very few in number. F. Mabillon has also printed the *Calendar* of the church of Carthage; made about the year 483. The *Calendar* of the church of Ethiopia; and that of the Coptes, published by Ludolphus seem to have been made after the year 760. The *Calendar* of the Syrians, printed by Genebrard, is very imperfect: that of the Mulcovites, published by F. Papebroch, in most respects agrees with that of the Greeks, published by Genebrard. The *Calendar* published by Dom. d'Achery, under the title of *The solar year*, is no more than the *Calendar* of the church of Arras. The *Calendar* published in 1687, at Augsburg, by Beckius, is apparently that of the antient church of Augsborg, or rather Strasbourg, wrote towards the close of the 10th century. The Mosarabic *Calendar*, still used in the five churches of Toledo, the Ambrosian of Milan, and those of England, before the reformation; have nothing in them but what is found in those of the other western churches; viz. the saints honoured throughout, and those peculiar to the church where they are used.

CALENDER,* a machine used in the manufactories, for pressing certain stuffs, silks, and even linens; to make them smooth, even, and glossy: it is also used for waterings, or giving the waves to tabbies and mohairs.

* The word is formed from the French *Calandre*, or Spanish *Calandra*, which signify the same; and which some derive further from the Latin *Cylindrus*; in regard the whole effect of the machine depends upon a cylinder. Borel derives the name from that of a little bird, of the swallow kind; in regard of the agreement between the feathers of the bird, and the impression of the machine.

The *Calendar* consists of two large wooden rollers, round which the pieces of stuff are wound: these are put between two large close polished planks of wood; the lower serving as a fixed base; and the upper moveable, by means of a skrew like that of a crane; with a rope, fastened to a spindle which makes its axis: this upper part is of a prodigious weight, sometimes fifty or sixty thousand pound. It is this weight that gives the polish, and makes the waves on the stuffs about the rollers, by means of a shallow indenture or engraving cut in it. The rollers are taken off, and put on again, by inclining the machine.

CALENDIS, CALENDE,* *Calendas*, in the Roman chronology, the first day of every month.

* The word is formed from the Latin, *Calo*, or rather, Greek, *καλεω*, I call, or proclaim; by reason, before the publication of the Roman Fasti, it was one of the offices of the Pontifices to watch the appearance of the new moon, and give notice thereof to the Rex Sacriticulus; upon which a sacrifice being offered, the Pontiff summoned the people together in the capitol; and there with a loud voice proclaimed the number of *Calends*, or the day whereon the nones would be; which he did by repeating this formula, as often as there were days of *Calends*, *Calo Juno Novella*. Whence the name *Calendæ* was given thereto, from *Calo*, *Calare*. This is the account given by Varro. Plutarch, and after him Gaza, derives the word from *Clamo*, *Clamo* *luna Calendis clam fit*. But this is far-fetched. Others derive the appellation hence, that the people being convened on this day, the pontiff called, or proclaimed the several festis or holy days in the month; a custom which continued no longer than the year of Rome 450, when C. Flavius, the Curule Edile, ordered the Fasti, or *Calendar*, to be set up in public places, that every body might know the difference of times, and the return of the festivals.

The *Calends* were reckoned backwards, or in a retrograde order: thus, v. g. the first of May being the *Calends* of May, the last, or thirtieth of April, was the *Prædie Calendarum*, or second of the *Calends* of May; the twenty ninth of April, the third of the *Calends*, or before the *Calends*: and so back to the thirteenth, where the ides commence; which are, likewise, numbered invertedly to the fifth, where the nones begin; which are numbered after the same manner to the first day of the month, which is the *Calends* of April. See *NONES*, and *IDES*. The rules of computation by *Calends*, are included in the following verses.

*Prima dies mensis cuiusque est dicta Calendæ:
Sex majus Nonas, October, Julius, & Mars;
Quatuor at reliqui: habet Idus quilibet Odo.
Inde dies reliquos omnes dic esse Calendas;
Quas retro numerans dicis a mense sequente.*

To find the day of the *Calends* answering to any day of the month we are in, see how many days there are yet remaining of the month, and to that number add two: for example; suppose it the twenty-second of April; it is then the tenth of the *Calends* of May. For April contains thirty days; and twenty-two taken from thirty, there remains eight; to which two being added, the sum is ten.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

CALENTURE, an inflammatory fever, frequent at sea, attended with a delirium; wherein the patients imagine the sea to be green fields; and, if not prevented, will leap over-board: which way they are frequently lost. See *Supplement*, article *CALENTURE*.

CALIBER, or **CALIPER**, in a general sense, notes the extent of any round thing in thickness, or diameter.

In which sense we say, a column is of the same *Caliber* as another, when they are both of the same diameter.

CALIBER, more particularly denotes the bore, or width of a piece of ordnance, or other fire-arms; or the diameter of the mouth thereof; or of the ball it carries.

The *Caliber* is the rule by which all the parts of a cannon or a mortar, as well as of its carriage, are proportioned.

CALIBER-Compasses, a sort of *Compasses* made with arched legs, to take the diameter of round, or swelling bodies.

Caliber-compasses, are chiefly used by gunners, for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and move on an arch of brass, whereon are marked the inches, and half inches; to show how far the points of the *Compasses* are opened asunder. Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use *Calibers*, to embrace the two heads of any cask, in order to find its length.

The *Calibers* used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

CALIBER, or **CALIBER-Rule**, is an instrument, wherein a right line is so divided, as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first, as the diameters of balls of two, three, four, &c. pounds, are to the diameter of a ball of one pound. The *Caliper* is used by engineers, from the weight of the ball given, to determine its diameter, or *Caliper*; or vice versa.

The *Caliber* (*Tab. Fortif. Fig. 2.*) consists of two thin pieces of brass, six inches long; joined by a rivet, so as to move quite round each other, the head, or one end of the piece is cut circular; and one half of its circumference is divided into every second degree. On the other half are divisions from one to ten; each, again, subdivided into four: the use of which divisions and subdivisions, is, that when the diameter of a bullet, &c. not exceeding ten inches, is taken, the diameter of the semicircle, will, among the divisions, give the length of that diameter taken between the points of the *Calibers*, in inches and fourth parts.

The degrees on the head, serve to take the quantity of an angle; the method of which is obvious. If the angle be inward, apply the outward edges to the planes that form the angle; the degree cut by the diameter of the semicircle, shews the quantity of the angle sought. For an outward angle, open the branches till the points be outwards, and applying the straight edges to the planes that form the angle, the degrees cut by the diameter of the semicircle shew the angle required; reckoning from 180, towards the right-hand.

On one branch of the *Calibers*, on the same side, are, First, six inches; and each of these subdivided into ten parts. Secondly, a scale of unequal divisions, beginning at two, and ending at ten; each subdivided into four parts. Thirdly, two other scales of lines, shewing, when the diameter of the bore of a piece is ta-

ken with the points of the *Calibers* outwards, the name of the piece, whether iron or brass; i. e. the weight of the bullet it carries; or that it is such or such a pounder, from one to forty two pounds.

On the other branch of the *Calibers*, on the same side, is a line of cords to about three inches radius; and a line of lines on both branches, as on the sector; with a table of the names of the several pieces of ordnance. On the same face is a hand graved, and a right line drawn from the finger towards the center of the rivet; shewing, by its cutting certain divisions made on the circle, the weight of iron shot, when the diameter is taken with the points of the *Calibers*. Lastly, on the circle, or head, on the same side, are graved several geometrical figures inscribed in each other, with numbers; as a cube, whose side is supposed one foot; a pyramid on the same base and altitude, and the proportions of their weight, &c.; a sphere, inscribed in a cube; a cylinder, cone, circle, square, &c.

CALIDUCTS, a kind of pipes, or canals, disposed along the walls of houses and apartments; used by the ancients for the conveyance of heat to several remote parts of the house, from one common furnace.

CALIDUM Innatum, &c. See the article *HEAT*.

CALIPH, **CALIF**, **KALIPH**,* in oriental affairs, denotes a successor of Mahomet, in the spiritual as well as temporal empire erected by that legislator. See the article *MAHOMETAN*.

* The word is originally Arabic, *Khalifah*, which properly denotes a successor, or heir. Some pretend that it comes from a verb which signifies not only to succeed, but also to be in the place of another, not only as his heir, but as his vicar; in which sense, it was, according to Erpenius, that the Saracen emperors and high-priests were called *Caliphs*, as being God's vicars or lieutenants. But the more received opinion is, that they took this title as being Mahomet's successors.

After the death of Mahomet, Abubeker having been elected by the Mussulmans to supply his place, he would take no other title but that of *Khalifah resoulallah*, i. e. vicar of the prophet, or messenger of God. Omar coming afterwards to succeed Abubeker, represented to the Mahometan chiefs, that if he took the quality of vicar or successor of Abubeker, the vicar or successor of the prophet, the word vicar would in course of time come to be repeated and multiplied without end: upon which, at the motion of Mogairah, Omar took the title of *Emir Moumenin*, that is, Lord, or Prince of the Believers: an appellation accepted and born by all the legitimate *Caliphs*, or successors of Mahomet, from that time. Not but they still retained the title *Caliph* without other addition.

The *Caliphs* in the Mahometan, bear a near affinity to the popes in the Christian religion.

Vattier observes, they called themselves *Vicars of God*; and that the Mahometan sultans, and kings fell down before them, and kissed their feet: for which reason, V. de Beauvais, scruples not to call them the Mahometan popes.

CALIPPIC Period, in chronology, a series of seventy six years, returning perpetually round; which elapsed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, return to the same day of the solar year.

Meton, a hundred years before, had invented the *period* or cycle of nineteen years; (see *METONIC CYCLE*.) assuming the quantity of the solar year, 365 d. 6 h. 18' 56" 50" 31" 34"; and the lunar month, 29 d. 12 h. 45' 47" 20" 48" 30". But Calippus considering that the Metonic quantity of the solar year was not exact, multiplied Meton's *period* by 4, and thence arose a *period* of 76 years, called the *Calippic*. The *Calippic period* therefore contains 27759 days: and since the lunar cycle contains 235 lunations, and the *Calippic period* is quadruple of this, it contains 940 lunations.

It is demonstrated, however, that the *Calippic period* itself is not accurate; that it does not bring the new and full moons precisely to their places, but brings them too late by a whole day in 553 years.

CALIX, or **CALYX**. See the articles *CALIX*, and *CHALICE*. **CALIXTINS**, a name given to those among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, towards the middle of the sixteenth century, who opposed the opinion of St. Augustine, on predestination, grace, and free will. The *Calixtins* are esteem'd a kind of Semi-Pelagians. Calixtus maintained, that there is in all men a certain power of understanding and willing; with natural knowledge sufficient: And that a good use being made of these, God will give us all the means necessary to arrive at the perfection to which revelation directs them.

CALIXTINS, also denote a sect in Bohemia, about the middle of the fifteenth century, who asserted the use of the cup, as essential to the eucharist.*

* And hence their name; which is formed from the Latin, *Calix* of *καλός*, a Cup. See *CALYX*.

CALKING, or **CAULKING**, in the sea language, &c. See the article *CAUKING*.

CALL, in hunting, a lesson blown upon the horn, to comfort the hounds.

Amongst

Amongst fowlers, *Calls* are a sort of artificial pipes, made to catch several sorts of birds, by imitating their notes, to allure them to the net. See *Supplement, article CALLS*.

CALENDER, in the manufactures. See **CALENDER**, **CALLIBER**, or **CALIPER**. See the article **CALIBER**.

CALLIGRAPHUS*, antiently denoted a copist, or scrivener, who transcribed fair, and at length, what the notaries had taken down in notes, or minutes; which comes pretty near to what we call *Ingrossing*.

* The word is Greek, *Καλλιγράφος*; compounded of *καλός*, beauty, and *γράφω*, I write; q. d. *καλόν γράφειν*, ob scribendi elegantiam.

The minutes of acts, &c. were always taken in a kind of cypher, or short-hand; such as the notes of Tyro in Grueter: by which means the notaries, as the latins called them, or the *Σημειωταί* and *Ταχυγράφοι*, as the Greeks called them, were enabled to keep pace with a speaker, or person who dictated. These notes being understood by few, were copied over fair and at length, by persons who had a good hand, for sale, &c. and these were called *Calligraphi*; a name frequently met with in the ancient writers.

CALLUS, or **CALLOSITY**, in a general sense, denotes any cutaneous hardness, whether fleshy, or bony, and whether natural or preternatural.

In which sense, *Clavi*, or corns, are a species of *Callus*. See **CLAVUS**.

CALLUS, is also frequently used for a kind of node, which joins the extremities of a fractured bone.

The Formation of a *Callus* seems to be as follows: The juice that feeds the bone, running along its fibres, becomes extravasated in the place where those fibres are broke: so that stopping, and gathering together round the extremities of the fracture, it there dries, knits, and hardens, to a consistence like a strong glue; leaving only a little inequality in the place where it is formed.

Callus's frequently grow so firm as to supply the place of whole bones. In the *Phil. Transact.* we have an instance of a *Callus* supplying the place of the Os Humeri, taken out upon its being carious, by Mr. Fowler; and another of a *Callus* supplying the place of the Os Femoris, and the person as strong as ever, and walking without any lameness, by Mr. Sherman.

CALLUS, is also a hard, dense, insensible knob, or substance, rising on the hands, feet, &c. by much friction, and pressure against hard bodies.

CALOGERI, *Καλογεροί*, or **CALOYERS**, monks, or religious, in Greece, both male and female; inhabiting, particularly, mount Athos, but diffminated also throughout all the churches of the east. They follow the rule of St. Basil, and make vows like the western religious. There has never been any reform among them, but they still retain their original institution, keep their former habit, &c. to a title. Tavernier observes, they live a very retired austere life, eating no flesh; and keeping four lents, besides a great number of fasts, with great strictness. They eat no bread till they have earned it by the labour of their hands. During their lents, some do not eat above once in three days, others but twice in seven. Most of the night they spend in weeping and praying.

Some authors observe, that the word *Calogerus* is applied particularly to such, among their religious, as are become venerable by age, and the austerity of their life. It may be added, that though *Calogers*, among us, be a general name, and comprehend all the Greek monks; yet, in Greece itself, their priests, or regulars, are called *Hieromonachi*, *ἱερομοναχοί*.

The Turks also use the word *Calogers* for their dervices, or religious Mussulmen. See **DERVIS**.

CALOMEL, in pharmacy, a name given to *Mercurius Dulcis*, further sublimated to a fourth time, or upwards. The denomination *Calomel* rather seems to have first belonged to the *Æthiops mineral*; from *καλός*, pulchre, fair; and *μαλάς*, niger, black: for that white or pale bodies rubbed herewith, become black.

Some will have it first given to *Mercurius Dulcis*, by a whimsical chymist, who employed a black in his laboratory; whose complexion, as well as that of the mercury, he alluded to in the term: the medicine being fair, and the operator black.

CALOTTE, a cap, or coil of hair, satin, or other stuff; used first for necessity, but now become an ecclesiastical ornament, in France, &c.

It was first wore by cardinal Richieu: the red *Calotte* is a badge of a cardinal. See the article **CAP**.

CALOTTE, in architecture, a round cavity, or depression, in form of a cup, or cap, lathed, and plastered, used to diminish the rise, or elevation of a chapel, cabinet, alcove, &c. which, without such an expedient, would be too high for other parts of the pile.

CALQUING, or **CALKING**, a term in painting, &c. used where the back-side of any design is covered with black-lead or red chalk; and the strokes or lines traced through on a waxed plate, wall, or other matter; by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

CALTROP, or **CALTHROP**, an instrument with four iron points, disposed triangular-wise; so as there are always three

points bearing on the earth, the fourth being in the air. Several of these fixed in the ground where the cavalry is to pass, stick into the horses feet, and embarrass them. Hence *Caltrop* is also made the name of a plant, whose fruit resembles this machine.

CALVARIA, or **CALVA**, the scalp, or upper part of the head; so called from its growing bald first. See **HEAD**, and **CALVITIES**. **CALVARY***, a term used in catholic countries for a kind of chapel of devotion, raised on a hillock near a city; in memory of the place where Jesus Christ was crucified near Jerusalem.

* The word comes from the Latin, *Calvarium*, and that from *Calvus*, bald; in regard the top of that hillock was bare, and destitute of verdure: which is also signified by the Hebrew word *Golgetha*.

Such is the *Calvary* of St. Valerian, near Paris; which is accompanied with several little chapels, in each whereof is represented in sculpture one of the mysteries of the passion.

CALVINISM, the doctrine and sentiments of *Calvin* and his followers, with regard to matters of religion.

Calvinism subsists in its greatest purity in the city of Geneva; and from thence it was first propagated over France, the United Provinces, and England. In France it was abolished by the revocation of the Edict of Nantz, in 1685. It has been the prevailing religion in the United Provinces, ever since the year 1572. In England it has dwindled since the time of queen Elizabeth; and is now chiefly confined among the dissenters: though it still subsists, a little allayed, in the articles of the established church; and in its rigor in Scotland. Of the thirteen Swiss Cantons, there are six who profess *Calvinism*; which likewise obtains in the Palatinate; except that of late popery is there becoming the reigning religion.

The distinguishing tenets of *Calvinism*, are, 1st, That predestination and reprobation are prior to the preience of good or evil works. 2^{dly}, That predestination and reprobation depend on the mere will of God; without any regard to the merits or demerits of mankind. 3^{dly}, That God gives to those whom he has predestinated a faith which they cannot lose; a necessitating grace, which takes away the freedom of the will; and that he imputes no sin to them. 4^{thly}, That the reprobates cannot do any good work, by reason of original sin, which cleaves to them. 5^{thly}, That men are justified by faith only.—The modern *Calvinists* reject or palliate some of these articles.

In France the *Calvinists* are distinguished by the name of *Huguenots*; and, among the common people, by that of *Parpaillots*. In Germany they are confounded with the Lutherans, under the general title *Protestants*; only sometimes distinguished by the name *Reformed*.

F. Gaultier finds an hundred heresies in *Calvinism*; but F. Francis Feu-Ardent improves vastly on the list; making the heresies no less than one thousand four hundred.

CALVITIES, or **CALVITIUM**, in medicine, baldness, or a falling off the hair, especially of that of the fynciput, without being able to grow again; the moisture of the head, which should feed it, being dried up by some disease, old age, or the immoderate use of powder, &c.

CALX, literally signifies, lime; a sort of stone burnt, or calcined in a kiln for that purpose, to be used in the making of mortar, &c.

CALX, in chemistry, is a kind of ashes, or fine friable impalpable powder, which remains of metals, minerals, &c. after they have undergone the violence of a fire for a long time; and by that means have lost all their humid parts. See **CALCINATION**.

Gold and silver, after they have been reduced to a *Calx*, may always be again recovered to their former form and nature.

Calx of tin, is called *Putty*; and is of considerable use in polishing steel, mirrors, &c. See **PUTTY**.

Calx of brass, is called *Ætustum*. See **ÆSTUM**.

Calx of lead, is denominated *Ceruss*. See **CERUSS**.

For *Calx of antimony*, see **ANTIMONIUM Diaphoreticum**.

CALX, in anatomy; see the article **CALCANEUS**.

CALYX, or **CALIX**, in a general sense denotes a cup. See **CUP** and **CHALICE**.

CALYX, in botany, is sometimes applied to a flower whose body, or even a part of it, is formed in manner of a cup or *Chalice*; such is that of a tulip, &c. See **FLOWER**.

Pliny defines the *Calyx* the cavity in the middle of a flower where the stamina and apices are contained. Aulonius calls it *Calathus*.

CALYX, is more particularly used for that outward greenish cover which encompasses and defends the petals and other parts of a flower: serving also as a basis, or support to the whole. In which sense *Calyx* is the same with what is otherwise called *Perianthium*, and by Dr. Grew the *Empalement*.

The *Calyx* is that set of leaves which involves the Petals, as the Petals do the immediate organ of generation.

Müller describes the *Calyx*, as the cup of a flower before it opens; or the soft husks or skin in which a flower first, and often afterwards the seed of herbs, and fruit of trees, are covered.

The *Calyx* is in some plants of one entire piece; as in pinks, &c. and in some is divided into several; as in roses, &c.

Saffron has no *Calyx*; its flower comes out of the earth before its leaves.

CAMAIEU *, or **CAMAYEU**, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of Lulus Nature; so as to exhibit pictures without painting.

* The word comes from *Cambyla*, a name the orientals give to the onyx, when they find, in preparing it, another colour; as who should say, a *second stone*.

CAMAIEU is also applied by others to those precious stones, as onyx's, cornellians, and agats, whereon the lapidaries employ their art to aid nature, and perfect those representations.

CAMAIEU is also used for a painting, wherein there is only one colour; and where the lights and shadows are of gold, wrought on a golden, or azure ground.

When the ground is yellow, the French call it *Cirage*; when grey, *Griffaille*. This kind of work is chiefly used to represent Baffo Relievo's: the Greeks call pieces of this sort *Μεγεθυματα*. See Supplement, article **CAMMA**.

CAMALDULIANS, or **CAMALDUNIAN**s, an order of religious, founded by St. Romulus, in 1099; or, according to others, in 960, in the horrible desert of Camaldoli, situate in the state of Florence, on the Appennines.

Their rule is that of St. Benedict; and their houses by the statutes, are never to be less than five leagues from cities.

The *Camaldulians* have not bore that title from the beginning of the order; till the close of the XIth century they were called *Romuldians*, from the name of their founder. Till that time, *Camaldulan* was a particular name for those of the desert *Camaldoli*, and D. Grandi observes, was not given to the whole order, in regard it was in this monastery that the order commenced; but because the regulation was best maintained here.

CAMBER-Beam, in building, a piece of timber cut archwise, or with an obtuse angle in the middle, commonly used in platforms; as church leads, and on other occasions, where long and strong beams are required.—A *Camber-beam* is much stronger than another of the same size; since being laid with the hollow side downwards, as they usually are, it represents a kind of arch.

CAMBLET *, or **CHAMLET**, a stuff sometimes of wool, sometimes silk, and sometimes hair, especially that of goats with wool or silk: in some, the warp is silk and wool twisted together, and the woof hair.

* *Menage* derives the French word *Camelot* (whence our *Camblet*) from *Ramelotto* a Levantine term for stuffs made with a fine hair of a Turkish goat: whence the word *Cymatilis* for *Turkish Camelot*. Others call it *Capellota*, from *Capellum*, the goat. Bochart makes *Zamelot*, a corruption of the Arabic *Giamal*, a *Camel*. Others fetch *Camblet* from the bare Latin *Camelus*: on which footing *Camblet* should properly signify, a stuff made of Camels hair.

England, France, Holland, and Flanders, are the chief places of this manufacture; Brussels exceeds them all in the beauty and quality of its *Camblets*: Those of England are reputed the second.

Figured CAMBLETS, are those of one colour, whereon are stamped various figures, flowers, foliage, &c. by means of hot irons, which are a kind of moulds, passed, together with the stuff, under a press. These are chiefly brought from Amiens and Flanders: The commerce of these was antiently much more considerable than at present.

Water CAMBLETS, those which, after weaving, receive a certain preparation with water; and are afterwards passed under a hot press, which gives them a smoothness and lustre.

Waved CAMBLETS, are those whereon waves are impressed, as on tabbies; by means of a calender, under which they are passed and repassed several times.

The manufacturers, &c. of *Camblets*, are to take care they do not acquire any false and needless plaits; it being almost impossible to get them out again: This is notorious, even to a proverb: we say, a person is like *Camblet*, he has taken his plait.

CAMBRING, or **CAMBARING**.—The seamen say, a *deck lies Cambring*, when it doth not lie level, but higher in the middle than at either end.—Also, if the ship's keel be bent in the middle upwards, (which may happen from her lying a-ground on a place, where neither her aft nor fore-part touch it, and from many other reasons taken from her make) they say, *She is camber-keeled*.

CAMELEON, **CHAMELEON**, in natural history, a little animal, famous among antient and modern writers, for a faculty it is supposed to have, of changing its colour, and assuming those of the objects near it.

The *Cameleon*, or *Chameleon* is of the lizard kind; only its head is somewhat bigger than that of the common lizard. It has four feet, and a long flat tail; whereby it can hang to the branches of trees, as well as with its feet. In Egypt there are some a foot long, including the tail; but those of Arabia do not much exceed half that length. Its snout is long, its back sharp; its skin, from the head to the last joint of the tail, plaited, and rough, say some, like a saw: Dr. Goddard says, 'tis grained, like a shagreen; the biggest grains, or globular inequalities, being about the head; the next on the ridge of the back. Its head is without any neck, as in fishes: it has two little apertures in the head,

that serve for nostrils; it has no ears, nor does it either make or receive any sound. Its eyes are big, and versatile like or that way, without moving the head, and ordinarily, it turns one of them quite the contrary way to the other. The tongue is half the length of the animal; consisting of a white flesh, round as far as the tip, which is flat and hollow; somewhat like an elephant's proboscis, or trunk; and accordingly, some call it a *trunk*. This it can dart out very nimbly, and draw back again, over a bone which reaches from the root, half its length; much as a silk stocking is drawn off and on the leg.

It is a common tradition, that the *Cameleon* lives on air; but experience shews the contrary. The great use of its tongue is to catch flies, by shooting it briskly upon them, and entangling them in its proboscis: Some say, the tongue is tipped with a glutinous matter, which the flies stick to; and at the R. Academy of Sciences, they frequently observed one to catch and swallow flies; they found also the signs of them in its excrements; and, when it was dissected, the stomach and intestines were found full of them.

M. Perrault assures us, that when at rest, and in the shade, the colour of the *Cameleon* is somewhat various: that at Paris, was of a bluish grey; but, when exposed to the sun, this grey changed into a brownish or darker grey; and its less illumined parts into divers colours; forming spots, half the bigness of a finger's end, some of them of an *Ilabella* colour: the grains of the skin, not illumined at all, resembled a cloth, mixed of divers colours. That at London, described in the *Philosophical Transactions*, by Dr. Goddard, was mixed of several colours, like a mottled cloth: the colours discernible, were a green, a sandy yellow, and a deeper yellow, or liver colour; but one might easily imagine some mixture of most, or all colours. He adds that upon excitation, or warming, it suddenly became full of black spots, of the bigness of a great pin's head, equally dispersed on the sides, &c. all which afterwards would vanish. M. Perrault observes somewhat like this of the Paris *Cameleon*; viz. that upon handling and stirring it, it would appear speckled, or stained with dark spots, bordering on green. He adds, that wrapping it up in a linnen cloth, for two or three minutes, it would sometimes be taken out whitish; though not constantly so: nor did it take the colour of any other stuff it was wrapped in. So that what Theophrastus and Plutarch write, that it assumes all the colours it comes near, excepting white, is exactly contrary to experience. Monconys assures us, that the *Cameleon*, when placed in the sun, appears green, though in a place where there is no grass, or other green object; that by the candle it appears black, tho' placed on white paper; and that, when shut up in a box, it becomes yellow and green: and he asserts, it never takes any other than these four colours.

Naturalists are very little agreed, as to the reason or manner of this change of colour: some, as Seneca, maintain it is done by suffusion; others, as Solinus, by reflexion; others, as the Cartesianists, by the different disposition of the parts that compose the skin, which give a different modification to the rays of light; others, as Dr. Goddard, ascribe the change to the grains of the skin; which, in the several postures, he thinks, may shew several colours; and, when the creature is in full vigour, may have, as he terms it, *rationem speculi*; that is, the effect of mirrors, and reflect the colours of bodies adjacent.

These hypotheses are all deficient enough, and there is still room for a new one; the *Cameleon*, then, is represented to us as an exceeding lean skinny animal; inasmuch, that the Italians call it a *living skin*. M. Perrault observes, of that which he dissected in the king's library, that one hour it appeared to be a meer skin, and nothing else; and yet the next it would appear fat and plump. Hence we gather, that it must have an extraordinary command over the skin, as to tension or laxness; since by swelling its bulk its skin will be filled, the fibres thereof stretched, and the pores lessened: and again, by withdrawing its grossness, the skin will be left lank and thrivelled, one part wrapping over another: Which is confirmed by what we have already observed, that its skin is usually seen to be full of rugae, or little plaits. Now the animal having it in his power to fill the skin more or less, has it in its power not only to alter the tone and texture of the fibres, upon which their reflexive quality, in a great measure, depends; but also to bring parts into light which before lay concealed, or to conceal such as before lay open: and it is more than probable, that the parts which are ordinarily covered, are of a somewhat different colour from those constantly open to the air.

On these principles, probably, all the phenomena in the *Cameleon's* colour may be solved. The animal, it is evident, has a power to reflect different coloured rays from the same parts; also to make certain parts reflect, and to prevent others reflecting: and, hence that variety, that medley of colours.

Mathiolus relates several superstitious notions of the antients touching the *Cameleon*; as, that its tongue torn out, while alive, helped the bearer to gain his law suit; that burning its head and throat with oaken wood, or roasting its liver on a red tile, made thunder and rain. That its right eye, torn out while living, and steeped in goat's milk, took away pearls in the eye; that its tongue tied about a woman with child, made her delivery safe.

That

That its right jaw removed all fear; and that its tail stopped the course of rivers: Pliny assures us that Democritus had composed a whole book of such follies.

CAMELEON, CHAMELEON, in astronomy, one of the constellations of the southern hemisphere, near the pole, and invisible to us.

CAMERA Obscura, in optics, a machine, or apparatus representing an artificial eye; wherein the images of external objects received through a double convex glass, are exhibited distinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glass.

The first invention of the *Camera Obscura*, is ascribed to Baptista Porta.

The Use of the CAMERA Obscura is manifold: It serves to very good purposes in explaining the nature of Vision; and hence it is that some call it *the Artificial Eye*. It affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed with their native colours; and by expressing at the same time, all their motions: Which latter, no other art can imitate. By means of this instrument, especially by the third contrivance under mentioned, a person unacquainted with designing, will be able to delineate objects to the last accuracy and justness; and another well versed in painting, will find many things here-in to perfect his art.

The Theory of the CAMERA OBSCURA, is contained in the following proposition.

If an object AB, (Tab. Opticks, Fig. 16.) radiate through a small aperture C, upon a white wall opposite thereto; and the place of radiation behind the aperture *b Ca* be dark; the image of the object will be painted on the wall, in an inverted situation.

For, the aperture C being very small, the rays issuing from the point B, will fall on *b*; those from the points A and D, will fall on *a* and *d*: Wherefore since the rays issuing from the several points are not confounded; when reflected from the wall, they will carry with them a certain species of the object, and exhibit its appearance on the wall. But since the rays AC and BC intersect each other in the aperture, and the rays from the lowest points fall on the highest; the situation of the object will of necessity be inverted.

Hence, since the angles at D and *d* are right, and the vertical ones at C are equal; B and *b*, and A and *a*, will be also equal; consequently, if the wall, where the object is delineated, be parallel to it, *ab: AB:: dC: DC*. That is, the height of the image will be to the height of the object, as the distance of the object from the aperture is to the distance of the image from the fame.

Construction of a CAMERA OBSCURA, wherein the images of external objects shall be represented distinctly, and in their genuine colours, either in an inverted, or an erect situation. 1. Darken a chamber, one of whose windows looks into a place set with various objects; leaving only a little aperture open in the one shutter. 2. In this aperture fit a lens, either plano-convex, or convex on both sides; to be a portion of a large sphere. 3. At a due distance, to be determined by experience, spread a paper, or a white cloth, unless there be a white wall for the purpose; for on this, the images of the desired objects will be delineated invertedly. 4. If it be rather desired to have them appear erect, it is done either by means of a concave lens placed between the centre and the focus of the first lens; or by receiving the image on a plane speculum inclined to the horizon under an angle of 45°; or by means of two lens's included in a draw-tube, in lieu of one.—Note, if the aperture do not exceed the bigness of a pea, the objects will be represented, even though there be no lens at all used.

To render the images clear and distinct, it is necessary the objects be illuminated by the sun's light: They will be still brighter, if the spectator first stay a quarter of an hour in the dark. Care must likewise be taken, that no light escape through any chinks; and that the wall be not too much illuminated. Farther, the greater distance there is between the aperture and the wall, the larger and more distinct will the images be; but the rays becoming, thus, too much dilated, the brightness of the image is weakened, till at length it become invisible.

Construction of a portable CAMERA OBSCURA. 1. Provide a little chest, or box of dry wood, (Tab. Opticks, Fig. 17.) of the figure of a parallelepiped; its breadth about ten inches, and its length two or more feet; according to the different magnitude of the diameter of the lens's. 2. In the plane BD fit a sliding tube EF with two lens's; or, to set the image at a less distance from the tube, with three lens's convex on both sides: The diameter of the two outers, or forwarder, to be $\frac{5}{8}$ of a foot; that of the inner lens, *u. g.* $\frac{3}{8}$. 3. Within the chest, at a proper distance from the tube, set up an oiled paper, perpendicularly, GH, so as images thrown upon it may be seen through. Lastly, in I make a round hole, so as a person may look conveniently thro' it with both eyes.

If then the tube be turned towards the objects, (the lens's being at their proper distance, to be determined by experiment) the objects will be delineated on the paper GH, erect as before.

Another portable CAMERA may be thus made. 1. In the middle of a cistula, or chest, (Tab. Opticks, Fig. 18.) raise a little turret, either round or square H I, open towards the object AB. 2. Behind the aperture, incline a little plain mirror *ab*, to an angle of 45°, which may reflect the rays, A *a* and B *b*, upon a lens convex on both sides G, included in a tube G L. 3. At the distance of the focus thereof, place a table covered with a white paper EF, to receive the image *a b*. Lastly, in N M make an oblong aperture to look through.

CAMISADE,* in the art of war, an attack by surprize, in the night, or at the point of day; when the enemy are supposed a-bed.

* The word is said to have took its rise from an attack of this kind; wherein, as a badge, or signal to know one another by, they bore a shift, in French called *Cbemis*, or *Camis*, over their arms.

CAMISARDS,* or **CAMISARS**, an appellation given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms, in their own defence, in the year 1688.

* The reason of the name is disputed. Some derive it from *Camisade*, in regard of the suddenness of their attacks and incursions from their mountains; others from *Camis*, which in that Country signifies a shift; either by reason they wanted, or plundered linen for shifts; or wore cloaths that resembled shifts. Others, with more probability, from *Camis*, a high or beaten road; by reason the roads were infested by the *Camisards*.

CAMP, a spacious post, or spot of ground, where an army rests, intrenches itself, or plants a piquet-watch, to lodge secure either in tents, or barracks.

The *Camp* is sometimes covered by an intrenchment; sometimes only by the advantage of its post: Sometimes it is inclosed with *Chevaux de Frise* laid across each other; the ordinary practice of the old prince of Orange.

The chief skill of a general lies in the art of incamping well: This the Romans were unacquainted with, till the war with Pyrrhus; from whose *Camp* they learned to model their own. Till then, they knew not how to post themselves to advantage, nor with any order in their *Camp*.

An *Incampment*, or *standing Camp*, is always to have the advantage of water, forage and fuel; with the means of covering and retrenching itself.

Rhœ, describing the great Mogul's *Camp*, says, it is twenty English miles round, and contains more space than the largest city in Europe; that it is composed of 800000 men, and 40000 elephants; and what increases the miracle is, that all these tents are pitched in four hours time.

Flying-CAMP, is a strong body of horse or dragons, to which are sometimes added foot; commanded usually by a lieutenant-general.

This always keeps the field, making frequent motions both to cover the garrisons in possession, and to infiltrate and keep the adversary in continual alarm, and oblige him to make diversions.

CAMPAIGN, a military term, signifying the space of time during which armies are maintained, yearly, in the field.

The Germans begin their *Campaign* very late; usually waiting for harvest: The French are always early, and begin sometimes in winter, by which they have reaped great advantages.

CAMPANULOUS, or **CAMPANIFORMIS**, an appellation given to those plants whose flowers resemble the shape of a bell.

CAMPECHE WOOD, a kind of wood brought from Yucutan, a province of America, and used in dying.

The heart of the tree, which alone is used, is at first red; after it has been felled some time, it becomes black; and, if steeped in water, gives a black tincture, such as may be wrote withal. It is very heavy, and burns admirably, and gives a clear lasting flame.

CAMPHOR, or **CAMPHERE**,* a white, shining, transparent, friable, inflammable, odoriferous, volatile gum, or resin, of a bitterish taste, and very hot in the mouth; flowing from a tree of the same name, frequent in the islands of Borneo, and Ceylon, and the neighbouring mountainous coasts of India; resembling a walnut tree.

* The word comes from the Arabic *Capur*, or *Capbur*; which signify the same thing.

Camphor distills from the tree in manner of a gum; and as is said, most plentifully in the time of earthquakes and storms. M. Lémery says, the *Camphor* is found at the foot of the tree; where it thickens into little grains of different figures and sizes; very dry, friable, light, and of a bitterish taste. These little grains falling on one another, adhere lightly together, and form masses; which being squeezed a little by the fingers, granulate again into small corpuscles, like salt.

Some authors make two different kinds of *Camphor*, according to the different parts of the tree where they are found: That in the veins of the wood, is said to be different from that which oozes out upon breaking the bark.

The *Camphor*, it is said, being at first dusky, is whitened either by the sun or the fire. In effect, we have but little of the raw natural *Camphor* among us; the Dutch take care that it come all refined by sublimation, and prepared to our hands.

Manner of refining crude CAMPHOR. The method is to set it to sublime in subliming pots; when the vessel is half full, it is stop-

ped, and placed over a gentle fire; where only the purest part rises at first; but, by degrees, the whole is sublimed, except a Caput Mortuum, or earthy matter sticking at bottom: They then melt it with a gentle heat, and run it into moulds to give it what figure they please.—It is so volatile, and apt to evaporate in smoke, that the merchants ordinarily inclose it in line-seed, that the viscosity of that grain may keep its particles together.

Camphor has various uses; as in fire-works, in making varnish, &c. In the courts of the eastern princes, it is burnt, together with wax, to illumine the night. It is exceedingly inflammable, so as to burn and preserve its flame in water; and in burning it consumes wholly, leaving no scoria behind: But its principal use is in medicine.

Camphor is the most efficacious diaphoretick known; its great subtilty diffusing itself through the substance of the parts, almost as soon as the warmth of the stomach has set it in motion. It is used also in caries of the bones, as a detergent in wounds, to resist gangrenes, &c. When mixed with the subtle salts of cantharides, it prevents their injuring the bladder; its exquisite fineness enabling it to follow them into all the meanders of the vessels, and to flesh their apertures.

Dr. Quincy observes, that *Camphor* begins to be mixed, and that to good purpose, with mercurials, to guard against their stimulating properties, and to send them into the finest passages, to operate by fusion, and the force of impulse. For not only Mercurius Dulcis or Calomel, may be hereby restrained from manifest operation in the glands about the mouth; but also the mineral Turbith, which of itself acts very strongly by stool and vomit, when mixed with *Camphor*, will be much less felt in those respects; and will go into the farthest circuit of motion, and promote the cutaneous discharge, in a more efficacious manner than any medicine of less spec. fick gravity.

M. Lemery endeavoured at a chymical analysis of *Camphor*, but in vain; either its parts were too fine and volatile to be carried to any greater degree of purity or subtilty by any chymical process; or it was owing to the close union of its principles, which in all appearance must be an oil and a volatile salt, that they could not be separated.

Camphor, he observes, does not dissolve in aqueous or plegmatic liquors; but in sulphurous ones it does; not in alkalies, nor even in some acids: but in spirit of nitre it dissolves perfectly; and is the sole resin that does so. This dissolution is ordinarily called *Oil of Camphor*; and it is to this the medicinal virtue of *Camphor* in wounds, gangrenes, and caries is ascribed. They do not take it internally, for fear of its sharpness and corrosiveness; though M. Lemery has found good effects from two or three drops by the mouth, in obstructions and fits of the mother; in these cases indeed, he generally mixed it with as much oil of amber.

There is a common verse to the discredit of *Camphor*, as if its smell emaculated:

Camphora per Nares castrat odore Mares.

But the proverb, according to Scaliger and Tulpus, is false. *Camphor*, being boiled in aqua vitæ, in a close place, till the whole be evaporated; if a lighted torch or candle be introduced, the air in the whole place will immediately catch fire, and appear in a flame, without doing any damage to the place or the spectators.

It has been found, in Ceylon, that the root of the tree which yields cinnamon, yields, by incision, a matter that has a strong smell of *Camphor*, and many of its virtues; whence naturalists, by mistake, have supposed that all *Camphor* came from that tree.

—There is also a smell of *Camphor* in several other plants, as in camphorata, abrotanum, rosemary, &c.

What is called *artificial CAMPHOR*, is prepared with gum sandarach, and white vinegar distilled, kept twenty days in bordeaux, and afterwards exposed a month to the sun to dry; at the end of which, the *Camphor* is found, in form of the crust of a white loaf.—This is also called *Juniper Gum*, *white Varnish*, and *Majlic*.

CAMPUS Maii, in antient customs, an anniversary assembly of our ancestors, held on May-day; where they confederated together for defence of the kingdom against all its enemies.

CAMUS, a person with a low, flat nose, hollowed or sunk in the middle.

The tartars are great admirers of *Camus* beauties. Rubruquis observes, that the wife of the great Lenghis Kan, a celebrated beauty, had only two holes for a nose.

CANAL, **CANALIS** in anatomy, a duct, or passage, thro' which any of the juices, or fluids of the body flow.

CANAL of the Larmier, the hollowed plafoed or fossit of a cornice; which makes the pendant mouchette. See **LARMIER**, and **SOF-FITO**.

CANAL of the Volute, in the Ionic capital, is the face of the circumvolutions, enclosed by a listel.

CANALES Semicirculares, in anatomy, are three *Canals*, in the labyrinth of the ear; which open by as many orifices into the vestibulum.

They are of three different sizes, *Major*, *Minor*, and *Minimus*. In different subjects, they are frequently different; but are always

alike in the same: The reason, Valsalva ingeniously conjectures to be, that as a part of the tender auditory nerve is lodged in these *Canals*, so they are of three several sizes, the better to suit all the variety of tones; some of the *Canals* suiting some tones, and others others. And though there be some difference in the form and size of these *Canals* in different persons; yet left there should be any discord in the auditory organs, these *Canals* are always in exact conformity to one another, in the same man.

CANALIS, or **CANALICULUS Arterialis**, in anatomy, a vessel, observed in fetus's, but which after delivery, grow useless, and disappears. It is a little tube, which joining the pulmonary artery and aorta, serves to convey the blood out of one into the other, without passing through the lungs. See **FOETUS**.

CANCELLIER, in falconry, is when a light flown hawk, in her stooping, turns two or three times upon the wing, to recover her self before she seizes.

CANCELLING,* in the civil law, an act whereby a person consents, that some former deed be rendered null, and void.—This is otherwise called *Rescissum*.

* The word comes from the Latin *Cancellare*, to compass, or pale a thing.

In the proper sense of the word, to *cancel*, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of chequer lattice, which the Latins call *Cancelli*.

CANCER, in astronomy, one of the twelve signs of the zodiack; ordinarily represented on the globe in form of a crab, and in astronomical books denoted by a figure much resembling that of the number of sixty-nine.

The Stars in the sign *Cancer*, Ptolemy makes 13; Tycho 15; Bayer and Hevelius 29; Mr. Flamsteed no less than 71.—Their order, names, places, longitude, latitude, magnitude, &c. in the *Britannick Catalogue*, are as follows.

Tropic of CANCER in astronomy, a lesser circle of the sphere parallel to the equator; and passing through the beginning of the sign Cancer.

CANCER, in medicine, a roundish, hard, ragged, immovable tumour, of an ash, or livid colour; uncompacted round with branched turgid veins, full of black foul blood; situate chiefly in the glandulous-parts: so called, as some will have it, from the resemblance it bears in figure to the crab-fish, or, as others say, because, like that fish, when once it has got hold, it is scarce possible to drive it away.

It begins without any pain, and appears, at first, like a chinch pea; but grows apace, and soon becomes very painful.

The *Cancer* arises principally on the lax glandulous parts, as the breasts and emunctories: It is most frequent in women, especially such, says Stollerfoth, as are barren, or live in celibacy. The reason of its appearing in the breasts more than other parts, is, that being full of glands, with lymphatics and blood-vessels among them, the smallest contusion, compression, or puncture, extravasates those liquors; which growing, by degrees, acrimonious, form the *Cancer*. Hence, the masters of the art say, that a *Cancer* is that in the glands, which a caries is in the bones, and a gangrene in the fleshy parts. The *Cancer*, however, is sometimes found in other soft, spongy parts of the body; and there have been some found in the gums, belly, neck of the matrix, ureter, lips, nose, cheeks, abdomen, thighs, and even the shoulders.

A *Cancer* arising on the legs, is called a *Lupus*; on the face, or nose, a *Noli me tangere*.

Cancers are divided, according to their several stages, into occult, and open or ulcerated.

Occult CANCERS are those not arrived at their state, or not yet burst.

Ulcerated CANCERS, are known by their roughness and fulness of holes, through which oozes a fishy, stinking, glutinous matter, frequently yellowish; by their pungent pain, which resembles the pricking with a thousand pins; and by their blackness; the swelling of the lips of the ulcer; and the veins about it, which are blackish, tumid, and varicous.

Sometimes the extremities of the blood-vessels are gnawed off, and the blood issues out. In a *Cancer* of the breast, the adjacent flesh is sometimes so consumed, that one may see into the cavity of the thorax. It occasions a slow fever, a loathing, oftentimes faintings, sometimes a dropy, and lastly death.

The immediate cause of a *Cancer*, seems to be a too corrosive volatile salt, approaching to the nature of arsenic, formed by the stagnation of the humours. Stollerfoth observes, that it has been frequently cured by mercury and salivation. Some take the ulcerous *Cancer* to be nothing else but an infinite number of little worms, which devour the flesh by degrees. The *Cancer* is allowed the most terrible evil that befalls the body: it is usually cured while yet a small tumour, of the bigness of a nut, or at most of a small egg, by extirpation: when it teizes the breast, or is burst into an ulcer, amputation takes place.

CANDIDATE *, a person who stands for some post or place, either of honour or profit.

* The word is latin. *Candidatus*, formed of *Candidus*, white, by reason of a white shining garment. *Toga Candida*, wherein those who aspired to preferments in ancient Rome, were habited at the time of their appearing for the same, especially at the publick assemblies, in order to distinguish them from the crowd.

CANDIDATI militum, were an order of soldiers of tall stature, who served as the emperor's body guards, to defend him in fight.

VOL. I.

They were thus denominated, because clothed in white, either that they might be the more conspicuous and their actions more taken notice of, or because they were considered as in the way to higher preferments. Cedrenus observes, that it was the younger Gordian who instituted the *Candidati*, as also the *Profectores* and *Scholares*. The *Scholares* were chose out of the troops, and consisted of persons who best understood the art of war: and out of these *Scholares* were chose the *Candidati*, who were such as were tallest and strongest, and had most of the martial air; and were proper to inspire terror, says the chronicon of Alexandria. The *Profectores* were a middle order.

CANDLE *, a cotton or linen wick, loosely twisted, and covered with tallow, wax, or sperma-ceti, in a cylindrical figure; which being lighted at the end, serves to illumine a place in the absence of the sun.

* The word *Candle* comes from the Latin *Candela*, and that from *Candor*, of *Candens* I burn; whence also the middle age Greek *κάνδαλα*.

A *Tallow Candle*, to be good, must be half sheep's tallow, half bullock's; the fat of hogs making them gutter, give an ill smell, and a thick black smoke.

Tallow Candles are of two kinds; the one *dipped*, the other *moulded*: the first, which are those in ordinary use, are of an old standing; the latter are said to be the invention of the Sieur le Brez, at Paris. The manufacture of the two kinds is very different, excepting in what relates to melting of the tallow, and making the wick, which is the same in both.

Method of making CANDLES. The tallows being weighed and mixed in their due proportion, are cut or hacked into pieces, to facilitate their melting, and thrown into a pot or boiler, having a cavity of some depth running round the top, to prevent its boiling over. Being, thus, perfectly melted, and skimmed, a certain quantity of water is thrown in, proportioned to the quantity of tallow; this serves to precipitate the impurities of the tallow, which had escaped the skimmer, to the bottom of the vessel. The tallow, however, intended for the three first dips, must have no water; in regard, the dry wick, imbibing the water readily, makes the *Candles* spit and crackle in the burning. The melted tallow is now emptied through a sieve into a tub, having a tap for letting it out, as occasion requires. The tallow thus prepared, may be used after having stood three hours; and will continue fit for use twenty-four hours in summer, and fifteen in winter.

For the wicks, they are made of spun cotton, which the chandlers buy in skeins; and wind off three or four together, according to the intended thickness of the wick, into bottoms, or clues, whence they are cut out with an instrument contrived for that purpose, into pieces of the length of the *Candle* required; then put on the sticks, or broches, or else placed in the moulds, as the *Candles* are intended to be either dipped or moulded.

Making of dipped CANDLES. The liquid tallow is drawn off, from the tub above-mentioned, into a vessel called the mould, sink, or abys, of an angular form, perfectly like a prism, except that it is not equilateral; the side on which it opens being only ten inches high; and the others, which make its depth, fifteen. On the angle, formed by the two great sides, it is supported by two feet, and is placed on a kind of bench, in form of a trough, to catch the droppings, as the *Candles* are taken out each dip. At a convenient distance from this, is seated the workman, who takes two sticks, or broches, at a time, strung with the proper number of wicks; viz. sixteen, if the *Candles* are to be of eight in the pound; twelve, if of six in the pound, &c. and holding them equidistant, by means of the second and third finger of each hand, which he puts between them, he immerses the wicks two or three times for their first lay, and, holding them some time over the opening of the vessel to let them drain, hangs them on a rack, where they continue to drain and grow hard. When cooled, they are dipped a second time, then a third, as before; only for the third lay they are but immersed twice, in all the rest thrice. This operation is repeated more or less times, according to the intended thickness of the *Candle*. With the last dip they neck them; i. e. plunge them below that part of the wick where the other lays ended.

It must be observed, that during the operation, the tallow is stirred from time to time, and the stock supplied with fresh tallow. When the *Candles* are finished, their peaked ends, or bottoms, are taken off; not with any cutting instrument, but by passing them over a kind of flat brazen plate, heated to a proper pitch by a fire underneath; which melts down as much as is requisite.

Method of making Mould CANDLES. These *Candles* are made in moulds of different matters: brass, tin, and lead are the most ordinary. Tin is the best, and lead is the worst. Each *Candle* has its mould, consisting of three pieces, the neck, shaft, and foot: the *shaft* is a hollow metal cylinder, of the diameter and length of the *Candle* proposed: At the extremity of this is the *neck*; which is a little metallic cavity, in form of a dome; having a molding within-side, and pierced in the middle with a hole big enough for the wick to pass through. At the other extremity is the *foot*, in form of a little tunnel, through which the liquid tallow runs into the mould. The neck is soldered to the shaft, but the foot is moveable, being applied when the wick

is to be put in, and taken off again when the *Candle* is cold. A little beneath the place where the foot is applied to the shaft, is a kind of string of metal, which serves to support that part of the mould, and to prevent the shaft from entering too deep in the table to be mentioned hereafter. Lastly, in the hook of the foot, is a leaf of the same metal, soldered within-side, which advancing into the centre, serves to keep up the wick; which is here hooked on, precisely in the middle of the mould. The wick is introduced into the shaft of the mould, by a piece of wire, which being thrust through the aperture of the hook, till it come out at the neck, the wick is tied to it; so that in drawing it back, the wick comes along with it, leaving only enough a-top for the neck; the other end is fastened to the hook, which thus keeps it perpendicular. The moulds, in this condition, are disposed in a table pierced full of holes, the diameter of each being about an inch: these holes receive the moulds inverted, as far as the string in the foot. Being thus placed perpendicularly, they are filled with melted tallow, (prepared as before) drawn out of the tin into a tin pot; and thence poured into the foot. After the moulds have stood long enough to cool, for the tallow to have arrived at its confluence, the *Candle* is taken out, by taking off the foot, which brings the *Candle* along with it. Those who aim at perfection in their work, bleach or whiten their *Candles*, by fastening them on rods or broches, and hanging them out to the dew, and earliest rays of the sun, for eight or ten days: care being taken to screen them in the day-time from the too intense heat of the sun; and in the night from rain, by waxed cloths.

Wax CANDLES are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax.—Of these there are several kinds; some called *Tapers*, used to illumine churches, and in processions, funeral ceremonies, &c. and others used on ordinary occasions.

For the first kind, their figure is conical, still diminishing from the bottom, which has a hole to receive the point in the candle-stick, to the top which ends in a point: the latter kind are cylindrical. The first are either made with a *ladle*, or with the *hand*.

Manner of making Wax CANDLES with the Ladle. The wicks being twisted, and cut off at the proper length, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended directly over a large basin of copper tinned, and full of melted wax: a large ladle full of this wax, is poured gently, by inclination, on the tops of the wicks, one after another; so that running down, the whole wick is thus covered: the surplus returning into the basin; where it is kept warm by a pan of coals underneath it. They thus continue to pour on the wax, till the *Candle* arrive at its destined bigness: still observing, that the three first ladles be poured on at the top of the wick, the fourth at the height of $\frac{1}{2}$, the fifth at $\frac{1}{4}$, and the sixth at $\frac{1}{8}$; by which means the *Candle* arrives at its pyramidal form. The *Candles* are then taken down hot, and laid aside of each other, in a feather-bed folded in two, to preserve their warmth, and keep the wax soft: They are then taken and rolled, one by one, on an even table, usually of walnut-tree, with a long square instrument of box, smooth at the bottom. The *Candle* being thus rolled and smoothed, its big end is cut off, and a conical hole is made in it.

Manner of making Wax CANDLES by the Hand. The wick being disposed, as in the former, they begin to soften the wax, by working it several times in hot water, contained in a brass caldron, tinned, very narrow and deep. A piece of the wax is then taken out, and disposed, by little and little, around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing still, as they descend towards the neck. In other respects, the method is the same here, as in the former case; only that they are not laid in the bed, but are rolled on the table, just as they are formed. It must be observed, however, that in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, lard, or oil of olives, for the hands, table, &c.

Cylindrical Wax CANDLES, are either for the *Table*, or *Drawn*. The first kind are made of several threads of cotton, loosely spun, and twisted together, covered with the ladle, and rolled, as the conical ones, but not pierced.

Wax CANDLES drawn, are so called, because actually drawn, in the manner of wire, by means of two large rollers, or cylinders of wood, turned by a handle, which turning backwards and forwards several times, pass the wick through melted wax, contained in a brass basin; and at the same time through the holes of an instrument, like that used for drawing wire, fastened at one side of the basin: so that, by little and little, the *Candle* acquires any bulk, at pleasure, according to the different holes of the instrument through which it passes: By this method, may four or five hundred ells length be drawn, running. The invention of this was brought from Venice by Pierre Blesimare, of Paris, about the middle of the last century.

Safe, or Auction by Inch of CANDLE, is, when a piece of *Candle* being lighted, people are allowed to bid while it burns, but as soon as extinct, the commodity is adjudged to the last bidder.

There is also a kind of *Excommunication by Inch of CANDLE*; wherein, the time a lighted *Candle* continues burning, is allowed

the sinner to come to repentance, but after which, he remains excommunicated to all intents and purposes.

CANDLEMASS,* a feast of the church, held on the second of February, in honour of the purification of the blessed virgin.

* It takes its name either from the number of lighted candles used by the Romish church in the processions of this day: Or because, before *Masi*, the church consecrated *Candles* for the whole year.

Candlemas is also called, in ancient writers, *Hypapante*; and among moderns, the *Purification*.

Some will have this feast to have been instituted by pope Gelasius, in lieu of the heathen *Iupercalia*; and that procession was thereon made with lighted *Candles* round the fields and grounds, by way of exorcism. Hence Bede says, "It is happy for the church to have changed the lustrations of the heathens, held in the month of February, around the fields, for the processions with hallowed *Candles*, in remembrance of that divine light wherewith Christ illuminated the world, whence he was styled by Simeon, a *light to lighten the Gentiles*." Others ascribe the origin of *Candlemas* to pope Vigilius, in the year 536; and suppose it substituted for the feast of Proserpine, held with burning tapers by the heathens in the beginning of February.

CANDY, in speaking of sugar, denotes a preparation of that substance, made by melting, and crystallizing fix or seven times over to render it hard, and transparent. See **SUGAR**.

CANDYING, makes an operation in pharmacy, as well as confectionary. Those simples which are preserved in substance by boiling in sugar being said to be *Candied*: Though the performance hereof is now turned over to the confectioner from the apothecary, to whom originally it belonged.

CANE, CANNA, a long measure, frequent in Italy, Spain, and the south parts of France; of greater or less length, according to the places where it is used.

At *Naples*, the *Canna* is equal to seven foot $3\frac{1}{2}$ inches, English measure: the *Canna* of Tholouse, and the upper Languedoc, is equal to the vara of Arragon, and contains five feet $8\frac{1}{2}$ inches; at Montpellier, in Provence, Dauphine, and the lower Languedoc, to six English feet $5\frac{1}{2}$ inches.

CANEPHORÆ, *Kaneporoi*, in antiquity, were two virgins of quality at Athens, kept in Minerva's temple in the Acropolis, who at the feast of the Panathenæa, carried baskets on their heads with something secret or mysterious therein, delivered to them by the priests.

The baskets were usually crowned with flowers, myrtles, &c.—The *Canephoræ*, in these ceremonies, always marched the first; the philosopher or priest next, and the choir of music followed.

CANEPHORIA, was a ceremony, which made part of a feast, celebrated by the Athenian virgins on the eve of their marriage-day. The *Canephoria*, as practised at Athens, consisted in this; that the maid conducted by her father and mother, went to the temple of Minerva; carrying with her a basket full of presents, to engage the goddess to make the marriage happy; or rather, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protectress of virginity, for abandoning her party; or it was a ceremony to appease her wrath.

CANICULA, is a name given to one of the stars of the constellation Canis major; called also simply the *Dog-star*; by the Greeks, *σείρις*, *Sirius*. Pliny and Galen also give the appellation *Procyon* to the *Canicula*; though in propriety, *Procyon* is the name of another star, in the lesser Dog. See **PROCYON**.

Canicula is the tenth in order in the Britannic catalogue, in Tycho's and Ptolemy's it is the second. It is situate in the mouth of the constellation; and is of the first magnitude; being the largest, and brightest of all the stars in the heavens. Its longitude, latitude, &c. see among those of the other stars of **CANIS major**.

From the rising of this star, not cosmically, or with the sun, but heliacally, that is, its emergence from the sun's rays, which now happens about the fifteenth day of August, the ancients reckoned their *Dies Caniculares*, or dog-days. See **CANTICULAR**.

The Egyptians and Ethiopians begin their year at the rising of *Canicula*; reckoning to its rise again the next year, which is called the *Annus Canarius*.

CANICULAR Days, *Dies CANICULARES*, properly denote a certain number of days, preceding and ensuing the heliacal rising of *Canicula*, or the dog-star, in the morning.

Some authors tell us from Hippocrates and Pliny, that the day the *Canicula* rises, the sea boils, wine turns sour, dogs begin to grow mad, the bile increases and irritates, and all animals grow languid; and that the diseases ordinarily occasioned in men by it, are burning fevers, dysenteries, and phrenies.

The Romans sacrificed a brown dog every year to *Canicula* at its rising, to appease its rage. They supposed *Canicula* to be the occasion of the sultry weather, usually felt in the dog-days; but by mistake: in five or six thousand years more, *Canicula* may chance to be charged with bringing frost and snow; for it will rise in November or December.

CANINE Appetite, an inordinate hunger, to the degree of a discafe. See **BULIMIA**.

CAN

CAN

CANINE Teeth, *CANINI Dentes*, in anatomy, are two sharp, edged teeth in each jaw; one on each side, placed between the Incisors and Molares.

They are pretty thick and round, and end in a sharp point; they have each usually but one root, which is longer than the roots of the Incisors. Their proper use is to pierce the aliment.—Because the fore-teeth are not only apt to be pulled outwards by the things we hold and break with them, but are likewise more subject to blows than the Molares: therefore above two thirds of them are buried in their alveoli, or sockets; by which their resistance of all lateral pressures, is much greater than that of the Molares. Keill.

CANINUS Musculus, the same as Elevator Labii Superioris. See ELEVATOR.

CANIS Major, the great Dog; in astronomy, a constellation of the southern hemisphere, below Orion's feet, though somewhat to the westward of him: whose stars Ptolemy makes 18; Tycho observed only 13; in the Britannic catalogue they are 32. Their order, names, places, longitude, magnitude, &c. are as follow.

CANKER, sometimes denotes a speck made by a sharp humour, which gnaws the flesh almost like a caustic; very common to children, in their mouth especially.

CANKER, is also a disease incident to trees; which makes the bark rot and fall. See BARK, and DISEASES of plants.

CANNON,* in war, a military engine, or fire-arm for throwing iron, lead, or stone bullets, by force of gun-powder, to a place directly opposite to the axis of the cylinder whereof it consists.

* The word seems derived from the Italian *Cannone*, an augmentation of *Canna*, Cane; in regard a Cannon is long, straight, and hollow, like a cane.

The first Cannons were called *Bombarda*, from *Bombus*; by reason of their noise.

The parts and proportions of a Cannon about eleven foot long, are, its barrel, or cavity, nine foot; its fulcrum, or support, fourteen; and its axis seven; the bore, or diameter of the mouth six inches, and two lines the play of the ball: the diameter of the ball therefore six inches; and its weight thirty three pounds $\frac{1}{2}$. The metal thick about the mouth, two inches; and at the breech six. It weighs about five thousand six hundred pounds: its charge is from eighteen to twenty pounds. It carries, point-blank, six hundred paces; and loads ten times in an hour, sometimes fifteen; in a day one hundred and twenty times. Its bed fifteen foot broad, and twenty long, for the rebound. It requires twenty horses to draw it.

Luttrell makes brass Cannon the invention of J. Owen; and says, the first known in England, were in 1535. Cannons, however, he owns, were known before; and observes, that at the battle of Cressy, in 1346, there were five pieces of Cannon in the English army; which were the first that had been seen in France: Mezeray also says, that king Edward struck terror into the French army, by five or six pieces of Cannon; it being the first time they had seen such thundering machines.

Cannons are made cylindrical, that the motion of the ball may not be retarded in its passage; and that the powder, when on fire, may not slip between the ball and the surface of the Cannon, which would hinder its effect. Wolfius would have the Cannon always decrease, towards the mouth or orifice: in regard, the force of the powder always decreases, in proportion to the space through which it is expanded. The new Cannons, after the Spanish manner, have a cavity, or chamber at bottom of the barrel, which helps their effect. A Cannon is found to recoil two or three paces after explosion; which some account for from the air's rushing violently into the cavity, as soon as it is discharged of the ball: but the real cause, is, the powder's acting equally on the breech of the Cannon, and the ball.

For a battering-piece, whose ball is thirty-six pounds, there must be two cannoners, three chargers, and thirty pioneers. Cannons are distinguished from the diameters of the balls they carry; but this distinction is different in different nations. The proportion of their length to their diameter, depends rather on experience, than any reasoning *a priori*; and has been accordingly various, in various times and places: the rule is, that the gun be of such a length, as that the whole charge of powder be on fire ere the ball quit the piece. If it be made too long, the quantity of air to be driven out before the ball, will give too much resistance to the impulse; and that impulse ceasing, the friction of the ball against the surface of the piece, will take off some of its motion. Formerly, Cannons were made much longer than at present; till some made by chance 25 foot shorter than ordinary, taught them that the ball moves with a greater impetus through a less space than a larger. This Gustavus king of Sweden proved by experience in 1624; when an iron ball, forty eight pounds weight, was found to go farther from a new short Cannon, than another ball of ninety six pounds out of an old, longer piece: whereas, in other respects, it is certain the larger the bore and ball, the greater the range.

The names of the several Cannons, their length, their weight, and that of their balls, as they obtain among us, are as in the following table.

NAMES of CANNON.	Weight of an iron ball.	Weight of the Cannon.	Length of the Cannon.
Cannon Royal	48 lib.	8000 lb.	12 Feet
Demi-Cannon large	36	6000	12
Demi-Cannon ordinary	32	5600	12
Demi-Cannon least	30	5400	11

Bafe	5	200	4.6

CAN

The greatest range of a *Canon* is ordinarily fixed at an elevation of 45°. Dr. Halley shews it to be at 44°. M. S. Julian adjusts the ranges of the several pieces of *Canon*, from the weight of the ball they bear: the charge of gun-powder being always supposed in a subduple ratio of the weight of the ball: thus,

Weight of a leaden ball.	Horizontal range.	Greatest range.	Weight of a leaden ball.	Horizontal range.	Greatest range.
33 lbs.	600 Paces.	6000	12	450	5000
24	700	6000	8	400	5000
16	800	8000	2	150	5000

The same author adds, that a ball thrown to the distance of six hundred paces, sinks nine, ten, eleven, twelve, nay, thirteen foot within ground. For the *Methods of casting Cannons*, see **FOUNDRA**.

For the metal of *Cannons*, it is either iron, or which is more usual, a mixture of copper, tin, and brass: the tin is added to the copper, to make the metal more dense and compact: so that the better or heavier the copper is, the less tin is required. Some to a hundred pounds of copper, add ten of tin, and eight of brass: others, ten of tin, five of brass, and ten of lead. Braudius describes a method of making *Cannons* of leather, on occasion: and it is certain the Swedes made use of such in the long war of the last century; but these burst too easily to have much effect. It is found by experience, that of two *Cannons* of equal bore, but different lengths; the longer requires a greater charge of powder than the shorter, in order to reach the same range. The ordinary charge of a *Canon*, is for the weight of its charges, the *Canon* is to be cooled, with two pints of vinegar, mixed with four of water, poured into the barrel; the touch-hole being first stopped.

CANNULA, or **CANULA**, in chirurgery, a little tube, or pipe, which the chirurgeons leave in wounds and ulcers, that they dare not, or shuld not to heal up; because still suppurating. The *Canula* is to be made of gold, silver, or lead; and is perforated, that the pus entering within it, may fall upon a sponge, dipped in spirit of wine, and placed at the orifice, to keep the ulcer warm, and to prevent the external air from entering: Some of these *Canulae* have rings, whereby to keep them fast in the wound; and others have holes with ribbons through them, to bind them down. Some are round, others oval, others crooked.

There is a particular kind of *Canula*, formed taper-wise, with a screw fastened to one end, in manner of a cock: its use is, for the discharge of the water out of the abdomen, after tapping, in an ascites, or dropsy. To this end it is inserted into the body, through a hole made near the navel; with a pointed instrument, and sometimes a punch; and is fastened into its place by a bandage, and guarded from any injury of the cloaths, &c. by a case or cover. It has this advantage over the common tapping; that by means thereof, the water is drawn out when, and in what measure the patient pleases. See **PARCENTESIS**.

There are likewise a kind of copper, or iron *Canulae*, made for the more convenient application of actual cauteries: they are made very shallow, and are, in effect, little more than hoops; through the aperture whereof, the actual cautery is conveyed; which, by this means, is kept from damaging the adjacent parts.

CANOE, a denomination given to the little boats used by the savages in both Indies, as well as by the negroes in Guinea, made chiefly of the trunks of trees dug hollow, sometimes of pieces of bark fastened together.

CANON, a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral, or collegiate church.

Canons are of no great antiquity: Pafchier observes, that the name *Canon* was not known before Charlemaign: at least, the first we hear of, are in Gregory de Tours, who mentions a college of *Canons* instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I.

Original *Canons* were only priests, or inferior ecclesiasticks, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will, supported by the revenues of the bishoprick; and living in the same house, as his domesticks, or counsellors, &c. They even inherited his moveables, till the year 816; when this was prohibited by the council of Aix la Chapelle. By degrees, these communities of priests, shaking off their dependence, formed separate bodies; whereof the bishops, however, were still heads. In the Xth century, there were communities or congregations of the same kind, established even in cities where there were no bishops: these were called *Collegiates*; in regard, they used the terms *Congregation* and *Collegium* indifferently: the name *Chapter*, now given to these bodies, being much more modern. Under the second race of the French kings, the *Canonical*, or collegiate life, had spread itself all over the country; and each cath-

CAN

edral had its chapter, distinct from the rest of the clergy. But they were not yet defined to a life so easy as now-a-days. They had the name *Canon*, from the Greek *naves*, which signifies three different things, a *Rule*, a *Penion* or *fixed revenue to live on*, and a *Catalogue* or *Matricula*. Hence, some say, they were called *Canons*, by reason of the penion or prebend; (whence they are sometimes also denominated *Sportulantes Prætres*;) others hold, they were called *Canons*, because obliged to live according to the canonical rules and institutions, which were given them; and others, as M. de Marca, because their names were inserted in the *Matricula*, or catalogue of the cathedral.

In time, the *Canons* freed themselves from their rules, the observance relaxed, and, at length, they ceased to live in community, yet they still formed bodies; pretending to other functions besides the celebration of the common office in the church, yet assuming the rights of the rest of the clergy; making themselves a necessary council of the bishop; taking upon them the administration of a see during a vacancy, and the election of a bishop to supply it. There are even some chapters exempt from the jurisdiction of the bishop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones also continued to form bodies, after they had abandoned living in community.

Canons, are of various kinds; as Cardinal *Canons*, which are those attached, and, as the Latins call it, *Incardinati* to a church, as a priest is to a parish.

Domicellary CANONS, were young *Canons*, who not being in orders, had no right in any particular chapters.

Excellitative CANONS, were such as without having any revenue or prebend, had the title and dignities of *Canons*, a voice in the chapter, and a place in the choir; till such time as a prebend should fall.

Foreign CANONS, were such as did not officiate in the *Canonries* to which they belonged.—To these were opposed *Manfionary Canons*, or *Canons Residentiary*.

In a manuscript ordinary, at Rouen, mention is made of *Canons of thirteen marks*; which, perhaps, was the revenue of their *Canonicate*.

In the church, at London, were *Canons minor*, or little *Canons*, who officiated for the great ones. At Lucca there are *Mitred Canons*. There were also *Canons of poverty*; and *Canons ad succurrendum*, who were made *Canons* at the point of death, to partake of the prayers of the chapter.

Lay or *Honorary CANONS*, are such among the laity, as have been admitted, out of honour and respect, into some chapters of *Canons*.

Such as are the counts of Anjou, in the church of St. Martin de Tours; the kings of France, of St. Hilary in Poitiers, &c. the emperor, of St. Peters, &c.

Canons Regular, are *Canons* that still live in community; and who, like religious, have, in process of time, to the practice of their rules, added the solemn profession of vows.

They are called *Regulars*, to distinguish them from those *Canons* who abandon living in community, and at the same time, the observance of the *Canons* made as the rule of the clergy, for the maintenance of the ancient discipline.

The *Canons* subsisted in their simplicity till the XIth, others say the XIIth century, when some of them separating from the community, took with them the name of *Canons*, or *acephalous Priests*, because they declined to live in community with the bishop; and those who were left, thenceforth acquired the denomination of *Canons Regular*, and adopted most of the professions of the rule of St. Augustine.

It is disputed to which class the *Canons Regular* belong, whether to the clergy or the religious; both the clerical and monastic state being united in them. The point of priority and precedence is hotly contested also, both between the *Regular Canons* and the priests; and the *Regular Canons*, and simple monks: the double capacity of the *Canons* is the foundation of this controversy.

Tertiary CANONS, those who had only the third part of the revenues of the *Canonicate*.

Charlemaign ordained, that those who were admitted into the clerical, that is, the *Canonical* life, should be obliged to live canonically, and according to the rule prescribed them; obeying their bishops as monks do their abbot: by this means it was, that the spirit of monachism became introduced into cathedrals; for the clerks being tied to certain rules, became half monks; and instead of applying themselves to the function of the priesthood, shut themselves up in cloisters: whence the houses where they resided took the name of monasteries, and were to be kept inclosed; as appears by the synodical statutes of Hincmar, in 874. So that there were two kind of Monasteries, the one for monks, the other for *Canons*.

Singing, in a little time, became the chief employ of *Canons*, and is now almost the whole business they have left.

In the VIIIth century, S. Chrodegand made a rule for the *Canons*, which was received by them all, and is still extant in thirty four articles, drawn chiefly from that of St. Benedict, but accommodated to the clerical life. In this are prescribed their penances, habits, &c. There was a second rule made in 816, at

at the request of Charlemain, by the bishops then convened at Aix la Chapelle, on account of the Roman indiction; composed of extracts from the fathers and councils.

CANON, in an ecclesiastical sense, is a law or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of the sovereign. See **LAW**.

Canons are properly decisions of matters of religion; or regulations of the polity and discipline of a church, made by councils, either general, national or provincial.

Such are the *Canons* of the council of Nice, of Trent, &c. See **COUNCIL**, and **CANON LAW**.

There have been various collections of the *Canons* of the eastern councils; but four principal ones, each ampler than the preceding. The first, according to Uther, *A. D.* 380, containing only those of the first oecumenical council, and the five provincial ones: they were but 164 in number. To these, Dionysius Exiguus, in the year 520, added the 50 *Canons* of the apostles, and those of the other general councils. The Greek *Canons*, in this second collection, end with those of the council of Calcedon; to which are subjoined, those of the council of Sardica, and the African councils. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balsamon and Zonaras have commented.

There is a great dispute about the apostolical *Canons*, usually ascribed to St. Clement, Bellarmine, Baronius, &c. will have them to be genuine *Canons* of the Apostles: Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles' disciples in the second or third century; but Daille, &c. maintain them to have been forged by some heretic in the sixth century. The Greek church alone eighty-five of them, and the Latins only fifty; though there are eighty-four in the edition given of them in the *Corpus Juris Canonici*.

CANON is also used for the authorized catalogue of the sacred writings. See **BIBLE**.

The ancient *Canon*, or catalogue of the books of the Old Testament, was made by the Jews, and is ordinarily attributed to Elias. This is the *Canon* allowed to have been followed by the primitive church, till the council of Carthage; and, according to St. Jerom, this consisted of no more than twenty-two books; but that council enlarged the *Canon* very considerably, taking into it the books which we call apocryphal; which the council of Trent has further enforced; enjoining all these to be received as books of holy scripture, upon pain of anathema, and being attained of heresy.

The Romanists, in defence of this *Canon*, say, that it is the same with that of the council of Hippo, held in 393, and with that of the third council of Carthage, at which were present forty-seven bishops, and amongst the rest, St. Augustine; who declared that they received it from their fathers.

Some of the fathers distinguish the inspired writings into three classes, *Proto-Canonical*, *Deutero-Canonical*, and *Apocryphal*. See **DEUTERO-CANONICAL**.

Paschal CANON, a table of the moveable feasts, shewing the day of Easter, and the other feasts depending on it, for a cycle of nineteen years.

The *Paschal Canon* is supposed to be the calculation of Eusebius of Cæsarea, and to have been done by order of the council of Nice. See **EASTER**.

CANON, in monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them as their local Statutes.

This is also called *Regula*, as containing the rule and institution of their order.

The *Canon* differs from the *Missale*, *Martyrologium*, and *Necrologium*. See **MISSAL**.

CANON, again, is used for the catalogue of saints acknowledged and canonized in the Romish church.

CANON is also used, by way of excellence, in the Romish church, for the secret words of the mass, from the preface to the *Pater*; in the middle of which the priest consecrates the host. The common opinion is, that the *Canon* of mass commences with *Te igitur*, &c. The people are to be on their knees, hearing the *Canon*; and are to rehearse it to themselves, so as not to be heard.

The *Canon* is by some pretended to have been put into its present form by St. Jerom, by order of pope Siricius. Others ascribe it to pope Siricius himself, who lived towards the close of the fourth century. The council of Trent declare the *Canon* of the mass to have been framed by the church; and to be composed of the words of Jesus Christ, his Apostles, and the first popes.

CANON, in the ancient music, is a rule or method of determining the intervals of notes.

Ptolemy, rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone, (which was supposed to be formed by the difference between a diapente and a diatesseron) thought that musical intervals should be distinguished, according to the ratio's or proportions which the sounds terminating those intervals bear to one another, when considered according to their degree of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made

the diapason consist in a double ratio; the diapente in a sesquialterate; the diatesseron, in a sesquitercian; and the tone itself in a sesquioctave; and all the other intervals, according to the proportion of the sounds that terminate them: wherefore, taking the *Canon*, (as it is called) for a determinate line of any length, he shews how this *Canon* is to be cut accordingly, so that it may represent the respective intervals: and this method answers exactly to experiment, in the different lengths of musical chords.—From this *Canon*, Ptolemy and his followers have been called *Canonici*; as those of Aristoxenus were called *Musici*.

CANON, in geometry and algebra, a general rule for the solution of all cases of a like nature with the present inquiry.

Thus every last step of an equation is a *Canon*; and, if turned into words, becomes a rule to solve all questions of the same nature with that proposed.

Natural Canon of Triangles, is a table of sines, tangents, and secants together: so called, because serving principally for the solution of triangles.

Artificial Canon of Triangles, is a table wherein the logarithms of sines and tangents are laid down. See **SINE**.

CANON LAW, a collection of ecclesiastical constitutions, decisions, and maxims, taken partly from scripture, partly from the ancient councils, and partly from the decrees of popes, and the reports and sayings of the primitive fathers, whereby all matters of polity in the Romish church are regulated.

The *Canon Law* that obtained throughout the west, till the twelfth Century, was the collection of *Canons* made by Dionysius Exiguus in 520; the capitularies of Charlemain, and the decrees of the popes, from Siricius to Anastasius. — No regard was had to any thing not comprised in these; and the French still maintain the rights of the Gallican church to consist in their not being obliged to admit any thing else, but to be at liberty to reject all innovations made in the canonical jurisprudence since that compilation, as well as all papal decrees before Siricius.

Indeed, between the eighth and eleventh centuries, the *Canon Law* was mixed and confounded with the papal decrees, from St. Clement to Siricius; which till then had been unknown: this gave occasion to a new reform, or body of the *Canon Law*; which is the collection still extant, under the title of *The concordance of the discordant Canons*, made in 1151, by Gratian, a Benedictine monk, from texts of scripture, councils, and sentiments of the fathers, in the several points of ecclesiastical polity.

This work he divided according to the order of matters, not of times and councils, as had been done before: so that upon the appearance of this, all the ancient collections immediately sunk. It is divided into three parts: the first into an hundred and eight distinctions; the second into thirty-six causes, and the third into five distinct parts: the second part of the *Canon Law* consists of the decrees of the popes, from 1150, to pope Gregory IX. in 1229.

In 1297, pope Boniface continued the papal decrees as far as his time: this part the French make particular exception to, by reason of that pope's differences with their king Philip the fair. To these, pope John XXII. added the *Clementines*, or the five books of the constitutions of his predecessor Clement V. And to all these were after added, twenty constitutions of the said pope John, called the *Extravagantes*; and some other constitutions of his successors.

All these compose the body, or *Corpus* of the *Canon Law*; which, including the *Comments*, makes three volumes in folio; the rule and measure of church government: indeed, with us, since the reformation, the *Canon Law* has been much abridged and restrained; only so much of it obtaining, as is consistent with the common and statute laws of the realm, and the doctrine of the established church.

CANONESS, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids; without their being obliged to renounce the world, or make any vows.

There are few of these, except in Flanders and Germany: they are rather looked upon as a seminary and retreat of girls for marriage, than an engagement for the service of God.

CANONesses of St. Augustine, or *Regular Canonesses*, are a kind of religious, who follow the rules of St. Augustine; of which there are various congregations.

CANONIZATION,* a declaration of the pope, whereby, after a great deal of solemnity, he enters into the list of saints, some person who has lived an exemplary life, and wrought miracles.

* The word *Canonization* seems to be of later origin than the thing; there being no instance of the use of the word before the twelfth century, whereas St. Uldaricus was canonized in the tenth. The term is formed from *Canon*; in regard the primitive *Canonizations* were only orders of the popes, or bishops, whereby persons eminent for piety, &c. were inserted in the *Canon* of the mass, that they might be commemorated in the service: for that in those days, the use of martyrologies was unknown in the church.

Mabillon distinguishes two kinds of *Canonization*; a general, and

particular, the first made by a general council, or a pope; the second, by a bishop, a particular church, or a provincial council.

There are instances likewise of *Canonizations*, or at least of something very like them, by abbots.

At first, only martyrs were *canonized*; but by degrees they came to confessors, &c. It is disputed whether martyrdom do not supply the want of miracles?

Canonization antiently consisted in inserting the saint's name in the sacred diptychs, or *Canon* of saints; in appointing a proper office for invoking him, and erecting churches under his invocation, with altars for mass to be celebrated on; taking up the body from the place of its first burial, and the like ceremonies: by degrees, other formalities were added; and processions were made with the saint's image in triumph; the day of his death is declared a feast; and to render the thing still more solemn, Honorius III. in 1225, added several days indulgence to a *Canonization*.

It is a great dispute among the learned, when the right of *Canonization*, which it is owned was antiently common to ordinaries, especially metropolitans and princes, with the pope, became first peculiar to the pope? Some say, Alexander III. made this reserve to the holy see. The Jesuits of Antwerp in their Propylaeum assert, it was not established till two or three ages ago; and then by a mere custom, which passed tacitly into a law; which appears not to have been generally received in the tenth and eleventh centuries. This, however, is pretty certain, that it was generally allowed before pope Alexander III.; the archbishop of Vienne in France, and his suffragans, acknowledge it in an authentic manner in the year 1231, by a letter written to Gregory IX. desiring him to *canonize* Stephen, bishop of Die, who died in 1208. *Quia nemo, say they, quantalibet meritorum prerogativa polleat, ab ecclesia dei pro sancto habendus, aut venerandus est, nisi prius per sedem apostolicam ejus sanctitas fuerit approbata.*

CANONRY, or **CANONICATE**, the benefice filled by a *Canon*. *Canonicate* is distinguished from *prebend*, in that the *prebend* may subsist without the *Canonicate*, whereas the *Canonicate* is inseparable from the *prebend*. It is to the *Canonicate*, not to the *prebend*, that the right of suffrages and other privileges are annexed. See **PREBEND**.

CANTALIVERS, in building, pieces of wood framed into the front, or sides of a house, to sustain the mouldings and eaves over it.

Cantalivers are the same with modillions, except that the former are plain, and the latter carved. They are both a kind of cartouches set at equal distances under the corona of the cornice of a building.

CANTALIVER-CORNICE, is a cornice with *Cantalivers* or modillions under it.

CANTATA, in music, a sort of song, or composition, intermixed with recitatives, airs, and variety of motions: ordinarily intended for a single voice, with a thorough bass; sometimes for two, three, or more voices, with one or more violins, or other instruments.

The *Cantata* passed from Italy into France, and thence to us: it is something in it extremely fantastical and capricious, and seems only to please by its variety. The word is Italian, where it signifies the same thing.

CANTHARIDES,* *Kaybades*, in medicine, a kind of poisonous insects, with wings and feet like beetles; much used as an epispastic for the raising of blisters.

* The word is formed from *cantharus*, the name of a sort of beetle, and called also *scarabaeus venenosus*; the *Cantharides* are properly a species of the beetle or scarab kind.

Cantharides, called also *Spanish flies*, though they ought rather to be denominated *Spanish beetles*, are produced from a kind of little worms, hatched on wheat, the leaves of the poplar, &c. There are various kinds of *Cantharides*, but all of a greenish and golden hue; the best are those which appear with different colours, having yellow lines running across their wings; thick, and fresh. They are killed by exposing them over a very strong vinegar, which is made to boil for that purpose; after which they are dried, and may be preserved a year or two.

Cantharides are very sharp and corrosive, abounding with a subtle, caustic, volatile salt; whereby they become exceedingly injurious to the bladder, so as to ulcerate it, even when applied externally, if suffered to lie on too long. They are much commended in fevers, as they raise and strengthen a low trembling pulse, give relief in delirious ravings, soporiferous stupors, loss of reason, &c. (the common symptoms of high and dangerous fevers) they often also reduce continual fevers to regular and distinct remissions; and so make way for the bark: cleanse and open the obstructed glands, and lymphatics; bring on critical sweats, &c.

Dr. Morgan accounts for these effects of *Cantharides* thus: "The subtle and volatile pungent parts of which the *Cantharides* consist, being carried into the blood, and passing "with the lymph or serum into the glandular pipes, act there

"by dissolving, attenuating, and rarifying the viscid cohesions of the lymph; and by stimulating the nervous coats "of the vessels, they throw off their stagnant viscidities, and "thus restore the circulation and free drain of lymph from "the arteries to the veins; cleanse the expurgatory glands, "and bring on critical sweats, and urines. Thus, the extremely subtle, active, and pungent volatile salts, derived "from the *Cantharides*, purge the glands and lymphatics universally; much after the same manner as common cathartics do the guts." *Philosoph. princip. of medicine*, p. 304.

Cantharides are seldom used internally: in the *Philosoph. Transact.* indeed, we have instances of their internal use, and that with success, by Mr. Yonge, in dropsical and other cases; sometimes mixed with camphor, and sometimes without; only well washed down with large draughts of posset, pisan, emulsions, or the like. The form wherein he tells us he uses to administer this fiery insect, is that of a soft pill, or bolus, composed of three *Cantharides* prepar. Troch. & Myrrha 3ss. Sem. Amigr. vi. Rob. Cynob. q. s. This, in stubborn suppressions of the menses and lochia, in difficult childbirth, and retention of the secundines, he finds does wonders: he adds, that the heat or pain it occasions in the neck of the bladder, is much short of what he has an hundred times seen, and sometimes felt, from the application of an epispastic to the back.

Their principal use however is in vesicatories, to raise blisters on the skin; and by that means to turn off and discharge some flux of ill humours.

Cantharides are sometimes applied to the temples for the tooth-ach: the farriers use them in several diseases of horses. They must be chosen new, dry, and whole: they will not keep above two years, without spoiling or moulding into a dust, which is of no use.

CANTHUS, in anatomy, the corner, or angle of the eye; formed by the commissure or joining of the upper and lower eyelids. See **EYE**.

That corner next the nose, is called the *great, inner, and domestic Canthus*; and by some physicians the *fountain*. — The other, towards the temples, is called the *little, or external Canthus*.

CANTHUS, in chemistry, the lip of a vessel; or that part of the mouth of a vessel, which is a little hollowed, or depressed, for the easy pouring off a liquor.

Hence, to pour by decantation, is to pour through that place.

CANTON,* a quarter of a city, considered as separated and detached from the rest.

* The word *canton* is formed from the Italian *Cantone*, a square stone, or corner stone.

CANTON is also more frequently used for a small country, or district, under its separate government.

Such are the thirteen Swiss *Cantons*; each of which forms a republic apart; but all are leagued together; and constitute what is called the Helvetic body, or commonwealth of the Swisses.

CANTON, in heraldry, is one of the nine honourable ordinaries: being a square portion of the escutcheon parted from the rest.

It has not any fixed proportion; though regularly it should be less than a quarter: it is often only a ninth part, and used as an addition, or difference, frequently to express bastardy.

The *Canton* is sometimes placed at the right corner, and sometimes at the left; in which latter case, it is called a *Canton sinister*. Its form is expressed in *Tab. Herald. fig. 12*. — He bears ermin, a *Canton* argent, charged with a cheveron gules.

CANTON, is also used for the spaces left between the branches of a cross or saltier.

CANTONED, a word used in architecture, when the corner of a building is adorned with a pilaster, an angular column, rustick quoins, or any thing that projects beyond the naked of the wall.

CANTONED, **CANTONNEL**, or **CANTONIZED**, in heraldry, is when the four *Cantons*, or spaces round a cross, or saltier, are filled up with any pieces. — He bears gules, a cross argent, *cantonned* with four scollop shells.

The word is also used when there are little pieces in the *Cantons*, or spaces of any principal figure of an escutcheon. Thus the saltier of Lenox is *Cantonned* with four roses.

CANVAS, or **CANVASS**, a coarse sort of linen cloth, usually woven open, and regularly, in little squares; serving for divers domestic purposes; and especially for the ground of tapestry work, and painting.

CANVAS, is also used, among the French, for the model, or first words, whereon an air, or piece of music is composed, and given to a poet to regulate and finish. The *Canvas* of a song, is certain notes of the composer, which shew the poet the measure of the verses he is to make. Thus, Du Lot says, he has *Canvas* for ten fennels against the mules.

CAP, a garment serving to cover the head, and made nearly of the figure thereof.

The era of *Caps* and hats, is referred to the year 1449; the first seen in these parts of the world being at the entry of Charles VII. into Rouen: From that time they began, by little and little, to take place of the hoods, or chaperons, that had been used till then. M. le Gendre, indeed, goes further back; they began,

C A P

began, says he, under Charles V. to let fall the angles of the hood upon the shoulders, and to cover the head with a cap, or bonnet: when this cap was of velvet, they called it *mortier*; when of wool, simply *bonnet*: the first was laced, the latter had no ornament, besides two horns, raised a moderate height, one of which served in covering and uncovering. None but kings, princes, and knights, were allowed the use of the mortier.

The *Cap* was the head-dress of the clergy and graduates. Pasquier says, that it was antiently a part of the hood wore by the people of the robe; the skirts whereof being cut off, as an incumbrance, left the round *Cap* an easy commodious cover for the head; which round *Cap* being afterwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman, called Patrouillet: He adds, that the giving of the *Cap* to the students in the universities, was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the antient Romans, who gave a *Pileus*, or *Cap*, to their slaves, in the ceremony of making them free: whence the proverb, *Vocare servos ad Pileum*. Hence, also, on medals, the *Cap* is the symbol of liberty, whom they represent holding a *Cap* in her right hand, by the point.

The Chinese have not the use of the hat, like us; but wear a *Cap* of a peculiar structure, which the laws of civility will not allow them to put off; it is different for the different seasons of the year: that used in summer, is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with satin; to this is added, at top, a large lock of red silk, which falls all around as low as the bottom: so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance; sometimes, instead of silk, they use a kind of bright red hair, the lustre whereof no weather effaces. In winter they wear a plush *Cap*, bordered with martlet's or fox's skin; as to the rest like those for the summer. Nothing can be neater than these *Caps*; they are frequently fold for eight or ten crowns: but they are so short that the ears are exposed.

Square-CAP.—The *Cap*, or *Bonnet*, is a mark, or ornament of certain characters: Thus churchmen, and the members of universities, students in law, physic, &c. as well as graduates, wear *square Caps*. In most universities, doctors are distinguished by peculiar *Caps*, given them in assuming the doctorate. Wickliff calls the canons of his time *Bisurcati*, from their *Caps*. Pasquier observes, that in his time, the *Caps* wore by the churchmen, &c. were called *square Caps*; though in effect, they were round, yellow *Caps*.

The *Cap* is sometimes also used as a mark of infamy: in Italy, the Jews are distinguished by a *yellow Cap*; at Lucca by an *orange* one. In France, those who had been bankrupts, were obliged ever after to wear a *green Cap*, to prevent people from being imposed on in any future commerce. By several arrests in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their *green Cap*, their protection should be null, and their creditors empowered to cast them into prison: but the thing is not now executed.

CAP, in a ship, is a square piece of timber, put over the head, or upper end of a mast, having a round hole to receive the mast. By these *Caps*, the top-masts, and top-gallant-masts, are kept steady and firm in the trussel-trees; where their feet stand; as those of the lower masts do in the steps. See *Tab. Ship*, fig. 1. n. 31. 58. 76. 101. 113. 143. and fig. 1. n. 15.

Prig's CAP, in fortification. See *BONNET à Pretre*.

CAPACITY, in a general sense, an aptitude, or disposition to retain, or hold any thing.

Our law allows the king two *Capacities*, a natural, and a political; in the first he may purchase lands to him, and his heirs; in the latter to him and his successors.—The clergy have the like.

CAPARASON *, or *CAPARISON*, the covering, or clothing laid over an horse; especially a sumpter, or horse of state.

* The word is Spanish, being an augmentative of *Capas*, head.

Antiently, the *Caparasons* were a kind of iron armour, where-with horses were covered in battle.

CAPE, in geography, a *Head-land*; or a piece of land running out beyond the rest, into the sea.

Sicily was called by the antients *Trinacria*, by reason of its three *Capes*, or promontories, represented on medals, by three mens legs joined together at the top of the thigh, and bent in the knee; which pretty nearly resembles the triangular figure of that island.

CAPE, in law, a writ touching plea of lands and tenements; so termed, from the word which carries the chief intention or end of it.

CAPE, is of two kinds, the *magnum* and *parvum*; which in their effect are alike, as to the taking hold of things immovable: though in certain circumstances they differ; 1^o. In that the *CAPE magnum*, or *grand Cape* lies before; and the *CAPE parvum*, or *petit Cape*, after appearance. 2^o. *CAPE magnum* summons the defendant to answer to the default; and besides to

C A P

the demandant: *CAPE parvum* only to the default. It is called *petit Cape*, not because of its small force; but because contained in few words.

CAPE magnum is thus defined in the old *Nat. brev.* "Where a man hath brought a *Preceptum quod reddat* of a thing that touches plea of land, and the tenant makes default of the day to him given in the original writ; then this writ shall be for the king to take the land into his hands; and if the tenant come not at the day given him by the writ, he loses his land."

CAPE parvum, or *petit Cape*, is thus defined, *ibid.* "Where the tenant is summoned in plea of land, and comes at the summons, and his appearance is recorded; and at the day given him, prays the view; and having it granted, makes default: then shall this writ issue for the king, &c."

CAPE ad valentiam, a species of *CAPE magnum*, so called from the end to which it tends: It is thus described, "Where I am impleaded of lands, and I vouch to warrant another, against whom the summons *ad warrantandum* hath been awarded, and the sheriff comes not at the day given; then, if the defendant recover against me, I shall have a writ against the vouchee; and shall recover so much in value of the lands of the vouchee if he has so much: otherwise, I shall have execution of such lands and tenements as defend to him in fee; or, if he purchase afterwards, I shall have a re-summons against him; and if he can say nothing, I shall recover the value."

CAPELLA, in astronomy, a bright star of the first magnitude, in the left or preceding shoulder of the constellation Auriga.

In Ptolemy's and Tycho's catalogues, it is the third in order of that constellation. In the Britanic catalogue, the fourteenth: Its Longitude is 17°, 31', 41"; its Latitude 22°, 51', 47".

CAPER, *CAPPARIS*, the bud or blossom of a shrub of the same name, gathered green, ere it expand into a flower; dried in a shady place, till withered, then infused in vinegar; to which, at last, salt is added: after which, it is put up in barrels to be used as a pickle, chiefly in sauces; and sometimes also in medicine, as being very aperitive, and entering certain compositions for diseases of the spleen.

All the *Capers* sold throughout Europe, are brought from about Toulon, in France; except some small salt *Capers* from Majorca, and a few flat ones from about Lyons.

The bark of the *Caper-tree*, when dried, is much prescribed by the French physicians in opipulations of the spleen.

CAPHAR, a toll, or duty, imposed by the Turks on the Christian merchants, who carry or send merchandises from Aleppo to Jerusalem.

The *Caphar* was first settled by the Christians themselves when masters of the Holy Land, for the support of troops and forces, posted in the more difficult passes, to watch the Arabs, and prevent their pillages. But the Turks, who have continued, and even raised the toll, abuse it; exacting arbitrary sums of the Christian merchants and travellers, on pretence of guarding them from the Arabs; with whom they yet frequently keep an understanding, and even favour their robberies.

CAPHURA, *Капура*, the same with *Campbor*. See the article *CAMPBOR*.

CAPÍ-AGA, or *CAPÍ-AGASSI*, a Turkish officer, who is governor of the gates of the Seraglio; or grand master of the Seraglio.

The *Capi-aga* is the first dignity among the white eunuchs: He is always near the person of the grand signior: he introduces ambassadors to their audience: no body enters, or goes out of the grand signior's apartment but by his means. His office gives him the privilege of wearing the turban in the Seraglio, and of going every where on horseback. He accompanies the grand signior to the apartment of the sultana's, but stops at the door without entering. His appointment is very moderate; the grand signior bears the expence of his table, and allows him at the rate of about sixty French livres per day: but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge, without passing through his hand. The *Capi-aga* cannot be *Balhaw* when he quits his post.

CAPÍAS, a writ or process, which is of two sorts; one before judgment, called *Capias ad Respondendum*; granted in an action personal, when the sheriff, upon the first writ of distress, returns, *Nihil habet in boliva nostra*.

The other is a writ of execution after judgment, which is also of various kinds; as, *Capias ad satisfaciendum*, *Capias pro Fine*, *Capias Utlogatum*, &c.

CAPÍAS ad satisfaciendum, is a writ of execution after judgment; lying where a man recovers in an action personal, as for debt, damage, &c. in which cases, this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered; who is to be kept in prison till he make satisfaction.

CAPÍAS conductus ad proficiendum, an original writ, which lies, by the common law, against any soldier who has covenanted to serve the king in war, and appears not at the time and place appointed.

appointed. It is directed to two of the king's ferjeants at arms, to arrest and take him wherever he may be found; and to bring him *coram concilio nostro*, with a clause of assistance.

CAPIAS pro Fine, is where one being by judgment fined to the king, upon some offence against a statute, does not discharge it according to the judgment: By this writ, therefore, his body is to be taken, and committed to prison till he pay the fine.

CAPIAS Uilugatum, a writ which lies against one outlawed upon any action, personal or criminal; by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of return; when he is to present him to the court, to be there further ordered for his contempt.

CAPIGI, a porter, or doorkeeper of the Turkish Seraglio.

There are about five hundred *Capigis*, or porters in the Seraglio, divided into two companies; one consisting of three hundred, under a chief called *Capigi-Bassa*: who has a stipend of three ducats *per day*: The other consists of two hundred, distinguished by the name of *Cuccicapi*; and their chief *Cuccicapi-Bassa*, who has two ducats. The *Capigis* have from seven to fifteen *aspers per day*; some more, others less. Their business is to assist the Janizaries in the guard of the first and second gates of the Seraglio: sometimes all together; as when the Turk holds a general council, receives an ambassador, or goes to the mosque; and sometimes only in part; being ranged on either side, to prevent people entering with arms, any tumults being made, &c. The word, in its original, signifies gate.

CAPILLAMENT, literally signifies *Hair*; being formed of the Latin *Capillus*, of *Capa*; q. d. *Hair of the Head*. Hence the word is figuratively applied to several things, which, on account of their length, or their fineness, resemble hairs: As,

CAPILLAMENTS of the Nerves, the fine fibres, or filaments, whereof the nerves are composed.

"Is not vision performed chiefly by the vibrations of this medium, excited in the bottom of the eye by the rays of light; and propagated through the solid, pellucid, and uniform *Capillaments* of the optic nerves, to the sensorium? Newt. Opt. p. 328.

CAPILLAMENTS, in botany, more usually called *stamina*, are those small threads, or hairs, which grow up in the middle of flowers; and are headed with little knobs, called *Apices*. See **STAMINA**, and **APICES**.

CAPILLARY, of the Latin *Capillus*, a hair; is applied to several things, to imitate their exceeding smallness, or fineness, resembling that of a hair.

CAPILLARY Vessels, in anatomy, are the least, minutest, insensible ramifications of the veins and arteries; which, when cut, or broke, yield but very little blood.

The *Capillary vessels* should be conceived as vastly finer than hairs: they are best compared to the threads of cobwebs, and are sometimes called *evanescent vessels*.

CAPILLARY, or **CAPILACEOUS Plants**, a species of plants, thus denominated from their form, and manner of growth, as having no principal stalk, or stem, with branches, &c. shooting out of the same; but growing from the ground, like hairs from the head: and bearing their seed in little tufts, or prominencies, on the backside of their leaves.

The principal of these, is the *Capillus Veneris*, or *Adiantum*; from which the rest take their name.

The *Capillaries* are distinguished into those with an undivided leaf, as the hemionitis, and the phyllitis: those with a singly divided leaf, and which have the leaf either cut, or jagged in, but not divided into pinnae, clear home to the main rib; as, polypodium, lonchitis, scolopendria, adiantum, and acrostichon. Or else the leaf divided quite home to the rib, and hanging like pinnae; as the *chamaefelix marina*, and the *trichomanes*: Those which have the leaf doubly divided, or at least once subdivided, the first division being into branches, and the second into pinnae; as the hemionitis multifida, the *filix mas*, *filix palustris*, and *filix saxatilis*. Lastly, those which have the leaf trebly divided, or thrice subdivided; first into branches, then into little twigs, and after this into pinnae: such are, the *filix scandens* of Brazil, the *filix florida*, or *osmunda regalis*; the *filix mas ramosa*, the *filix femina vulgaris*, the *adiantum album floridum*, and the *dryopteris nigra*.

All the *Capillaries* are reputed of use in medicine, especially in the making of Pectoral syrups; to which, wonderful virtues are attributed. But, in effect, only the *Capillary* of Montpellier, *adiantum album* Montpellierense, and that of Canada, *adiantum album* Canadense, are regularly used for that purpose: the rest only serve to counterfeit them.

The ancients thought that the *Capillaries* were all without seed; and some of the moderns, particularly Dodonæus, have given into the opinion. But Bauhine, and other of the more accurate observers, maintain they have all their seed. Cæsius says, he has seen them with a microscope: since him, Mr. W. Cole, and others, have observed them with still more curiosity; the capsule, or seed vessels, are in some less by half than a small grain of common sand, in others much less; yet some of them contain about one hundred seeds.

CAPILLARY Tubes, in physics, are little pipes, whose canals are the narrowest possible; not such, whose diameters do not exceed that of a common hair; for none such can be made: the usual diameter of *Capillary tubes*, is a half, third, or fourth of a line: though Dr. Hook assures us he drew tubes in the flame of a lamp much smaller, as fine almost as a thread of a cobweb. See **TUBE**.

The *Ascent of Water*, &c. in *CAPILLARY Tubes*, is a famous phenomenon which has long embarrassed the philosophers: let one end of a small tube, open at both ends, be immersed in water, and the liquor within the tube will rise to some sensible height above the external surface: or, immerse two or more tubes in the same fluid, one of them a *Capillary* one, and the other considerably larger; the water will ascend considerably higher in the *Capillary* tube than the other; and this in the reciprocal ratio of the diameters of the tubes.

This effect, authors have commonly imputed to the unequal pressure of the air in unequal tubes: the air, say they, consists of ramose, spongy parts, intermingled and embarrassed among each other: now, a column of such air being suppoed perpendicularly incumbent on the canal of a small *Capillary* tube; part of the pressure of the column will be spent on the sides, or surface of the tube; so that the column will not act with its whole weight on the subjacent fluid, but will lose a greater or less proportion of its weight, as the diameter of the tube is the smaller. But this solution is destroyed, by the experiment's succeeding in *vacuo*, as well as in open air.

Others, as Mr. Hauksbee, &c. have recourse to the attraction of the annuli of the concave surface of the tube; to which opinion Dr. Morgan subscribes: "Part of the gravity of the water in the tube, says that author, being taken off, by the attractive power of the internal concave surface of the glass; the fluid within the tube, by the external greater weight or pressure, must ascend so far, as to compensate for this diminution of gravity by the attraction of the glass. He adds, that as the power of attraction in tubes, is in a reciprocal ratio of the diameters; by lessening the said diameter, or by supposing the tubes still smaller and smaller, water, or any other fluid, may be thus raised to any assignable height." *Phil. princ. of medicine*, p. 88, &c.

But this author is somewhat overzeal: for since in every *Capillary Tube*, the height to which the water will spontaneously ascend, is reciprocally as the diameter of the tube; it follows, that the surface containing the suspended water is always a given quantity. But the column of water suspended in every tube, is as the diameter of the tube: therefore, if the attraction of the containing surface be the cause of the water's suspension; it will follow, that equal causes produce unequal effects; which is absurd. And, again, not only his solution, but his phenomenon also is stretched too far: for it is not in all fluids that the phenomenon obtains; but in mercury the very contrary is found: that fluid in a tube, not rising so high as the level of that in the vessel; and the defect being found the greater as the tube is smaller.

We must, therefore, recur to Dr. Jurin's solution of this phenomenon, which is well supported by experiments: "The suspension of the water, (on that gentleman's system) is owing to the attraction of the periphery of the concave surface of the tube, to which the upper surface of the water is contiguous and adheres." This being the only part of the tube, from which the water must recede upon its subsiding; and consequently the only one which, by the force of its cohesion and attraction, opposes the descent of the water. This he shews to be a cause proportional to the effect; in regard, the periphery, and the suspended column, are both in the same proportion as the diameter of the tube. The suspension thus accounted for, the seemingly spontaneous ascent will easily be solved: for since the water that enters a *Capillary* tube as soon as its orifice is dipped therein, has its gravity taken off by the attraction of the periphery, with which its upper surface is in contact, it must necessarily rise higher; partly by the pressure of the stagnant water, and partly by the attraction of the periphery, immediately above that which is already contiguous to it.

CAPILLARY Fracture. See the article **CAPILLATION**.

CAPILLATION, or, **CAPILLARY Fracture**, according to some writers, is a fracture in the skull, so small that it can scarce be perceived; but yet it often proves mortal. See **FRACTURE**.

CAPISTRUM, in surgery, a *Head-Stall*, or bandage used in case of injuries of the head, especially fractures of the jaw.

CAPITAL, of the Latin *Caput*, is used on various occasions, to express the relation of a head, chief, or principal: Thus,

CAPITAL City, intimates the principal city of a kingdom, province, or state: as, London is the *Capital*, or *Capital City* of England; Moscow of Russia; Constantinople of the Ottoman empire; Rouen of Normandy, &c. See **METROPOLIS**, and **CITY**.

CAPITAL,

CAPITAL, or **CAPITAL Stock**, in commerce, is the fund, or stock of a trading company or corporation; or the sum of money which they jointly furnish, or contribute to be employed in trade.

The *Capital* of the East-India company, at its first erection, was 369891 l. sterling, which was afterwards doubled; and is now computed at upwards of 1703422 l. 500 pounds in the *Capital Stock* of this company, entitles the person to a vote in the general courts thereof.

The power given by parliament to the South-Sea company, to increase their *Capital*, was the source of all the mischief which ensued in the year 1720.

CAPITAL Crime, is that which subjects the criminal to a *Capital* punishment; i. e. to the loss of life, either natural or civil.

CAPITAL Lees, are the strong lees made by the soap-boilers, from pot-alshes.

They are also used in surgery, as a caustic; and to make the lapiis infernalis.

CAPITAL Letters. See the article **CAPITALS**.

CAPITAL Medicines, in pharmacy, are the great, or principal preparations of the shops; these are remarkable for the number of their ingredients, and their extraordinary virtues, such as Venice Treacle, Mithridate, &c.

CAPITAL, in architecture, the uppermost part of a column or pilaster, serving as the head, or crowning thereof; placed immediately over the shaft, and under the entablature.

CAPITAL of a column, properly, is that whose plan is round.

Whereas the **CAPITAL of a Pilaster**, is that whose plan is square; or at least rectilinear.

The *Capital* is a principal, and essential part of an order of column or pilaster; it is made different in the different orders; and is that which chiefly distinguishes and characterizes the orders themselves.

Tuscan CAPITAL, is the most simple and unadorned: its members, or parts, are but three, viz. an Abacus; under this an Ovolo, or quarter round; and under that, a Gorge, or Colarino. The gorge, or neck terminates in an astragal, or fillet belonging to the fust, or shaft.—See *Tab. Archit. Fig. 24*.

The character of this *Capital*, whereby it is distinguished from the Doric, &c. is that the abacus is square, and quite plain, and has no ogee or other moulding; and that there are no annulets under the ovolo.

Indeed, authors vary a little as to the character of the Tuscan *Capital*. Vignola gives the abacus a fillet, in lieu of an ovolo. Vitruvius and Scamozzi, add an astragal and fillet, between the ovolo and neck: Serlio only a fillet; Philander rounds the corners of the abacus. In the Trajan column there is no neck; but the astragal of the shaft is confounded with that of the *Capital*.

The height of this *Capital* is the same with that of the Base, viz. one module, or semidiameter. Its projecture is equal to that of the cincture at the bottom of the column; viz. $\frac{1}{2}$ of the module.

Doric CAPITAL, beside an abacus, an ovolo, and a gorge, in common with the Tuscan, this has three annulets, or little square members, underneath the ovolo, in lieu of the astragal in the Tuscan; and a talon, cima, or ogee, with a fillet over the abacus.

Authors vary, too, as to the characters of this *Capital*: Palladio, Vignola, &c. put roses under the corners of the abacus, and in the neck of the *Capital*.

The height of this *Capital*, Vitruvius, &c. makes one module; and its projecture $\frac{3}{4}$ minutes and an half.—See *Tab. Archit. Fig. 28*.

Ionic CAPITAL is composed of three parts; an abacus, consisting of an ogee and a fillet; under this a rind, which produces the volutes, or scrolls, the most essential part of this *Capital*; and at the bottom, an ovolo, or quarter round: the astragal, under the ovolo, belongs to the shaft. The middle part is called a *rind*, or bark, from its supposed resemblance to the bark of a tree laid on a vase, whose brim is represented by the ovolo, and seeming to have been thrunk up in drying, and to have twisted into the volutes.

The Ovolo is adorned with eggs, as they are sometimes called, from their oval form: The Greeks call it the *Echino*.

The height of this *Capital*, M. Perrault makes eighteen minutes; its projecture one module, seven tenths.—See *Tab. Archit. Fig. 32*.

The differences in the character of this *Capital*, flow mostly from the different management of the volutes; and consist in this: that in the antique, and some of the modern, the eye of the volute answers not the astragal of the top of the shaft, as Vitruvius and most of the moderns make it: that the face of the volutes, which usually make a flat, is sometimes curved and convex, so as the circumvolutions go advancing outwards; as is frequent in the antique: that the border, or rim of the scroll in the volute, is sometimes not only a plain sweep, as ordinarily; but the sweep is accompanied with a fillet: That

the leaves which invest the balluster, are sometimes long and narrow; sometimes larger and broader; that the two faces of the volutes are sometimes joined at the outer corner; the ballusters meeting in the inner, to make a regularity between the faces on front and back of the building, with those of the fides: that among the moderns since Scamozzi, the *Ionic Capital* has been altered, and the four faces made alike, by taking away the balluster, and hollowing all the faces of the volutes inwards, as in the composite; that Scamozzi, and some others, make the volutes to spring out from the ovolo, as from a vase, after the manner of the modern composite; whereas in the antique, the bark passes between the ovolo and abacus quite straight, only twisting at its extremities to form the volute. And lastly, that of late years, the sculptors have added a kind of little festoons, springing from the flower whose stalk lies on the first circumvolution of the volute; and supposed to represent the locks of hair hanging down on both sides of the face. See **IONIC**.

Corinthian CAPITAL, is much the richest: it has no ovolo; and its abacus is very different from those of the Tuscan, Doric, or Ionic; as having its faces circular, and hollowed inward, with a rose in the middle of each sweep. Instead of an ovolo, and annulets, here is only a brim of a vase; and the neck is much lengthened and enriched with a double row of eight leaves in each, bending their heads downwards; and between them, small stalks arising: whence spring the volutes; which do not resemble those of the *Ionic Capital*; and which, instead of the four in the Ionic, are here sixteen: four on each side, under the four horns of the abacus, where the volutes meet in a small leaf, which turns back towards the corner of the abacus. The leaves are divided, each making three ranges of lesser leaves, whereof they are composed; each lesser leaf is, again, generally parted into five, called *Olive Leaves*; sometimes into three, and called *Laurel Leaves*. The middle leaf, which bends down, is parted into eleven. In the middle, over the leaves, is a flower, shooting out between the stems and volutes, like the rose in the abacus. The height of this *Capital* is two modules $\frac{1}{2}$, and its projecture one $\frac{1}{2}$.

The differences in the character of this *Capital*, are, that in Vitruvius, &c. the leaves are in form of the acanthus; whereas in the antique, they are more ordinarily olive leaves: that their leaves are usually unequal, the undermost being made commonly tallest, sometimes the shortest; though sometimes they are all equal. Sometimes the leaves are ruffled; sometimes quite plain; the first row generally belly out towards the bottom, but are sometimes strait: sometimes the horns of the abacus are sharp at the corners, which seems agreeable to the rules of Vitruvius; but they are more commonly cut off. There is some difference too in the form and size of the rose. Again, the volutes are sometimes joined to each other; sometimes wholly separate: sometimes the spires of the volutes continue twisting even to the end of the same course; and sometimes they turn back again near the centre, in the form of an S.—See *Tab. Archit. Fig. 21*, and 26.

Composite CAPITAL, is so called, because composed of members borrowed from the *Capitals* of the other columns. It takes a quarter round, or ovolo, from the Doric; an astragal under this; together with volutes, or scrolls, from the Ionic; and a double row of leaves from the Corinthian, which it resembles in most other things; consisting, generally, of the same members, and the same proportions. In the middle of the abacus is a flower; and under the thorns, leaves which return upward, as in the Corinthian. Indeed, instead of stalks in the Corinthian, the *Composite* has small flowers, lying close to the vase or bell; twisting round towards the middle of the face of the *Capital*, and terminating in the rose.

The height of the *Composite Capital*, is two modules $\frac{1}{2}$, and its projecture one module $\frac{1}{2}$, as in the Corinthian.—See *Tab. Archit. Fig. 30*.

The differences of the character of this *Capital*, consist in this; that the volutes, which ordinarily descend, and touch the leaves, are in some works of the antique separate from them: that the leaves, which are generally unequal in height, the lower rank being tallest, are sometimes equal: that the volutes of the moderns generally spring out of the vase; whereas, in the antique, they ordinarily run straight the length of the abacus, over the ovolo, without striking into the vase: that the volutes, whose thickness is contracted in the middle and enlarged above and below in the antique, have their sides parallel in the works of the moderns: And lastly, that the volutes, which have been hitherto both by the antients and moderns, made as if solid, are now much lighter and more airy; the folds standing hollow, and at a distance from each other.

For the proportions of the several members of the **CAPITALS** of Columns, see **COLUMN**. See also each member under its proper head; as **ABACUS**, **ACANTHUS**, **VOLUTE**, &c. Some architects distinguish the *Tuscan* and *Doric Capitals*, which have no ornaments, by the title of *Capitals of mouldings*; and the three others, which have leaves and ornaments, they call *Capitals of Sculpture*.

Angular CAPITAL, is that which bears the return of an entablature, at the corner of the projection of a frontispiece.

CAPITAL of a Balluster, is that part which crowns the Balluster; which sometimes bears a resemblance to the *Capitals* of some columns; particularly the Ionic.

CAPITAL of a Niche, is a kind of little canopy over a shallow niche, covering or crowning a statue.

CAPITAL of a Triglyph, is the plat-band over the Triglyph; called by Vitruvius *Tenia*. It is sometimes also a Triglyph which does the office of a *Capital* to a Doric pilaster.

CAPITAL of a Bastion, in fortification, is a line drawn from the angle of the polygon, to the point of the Bastion.

The *Capitals of Bastions* are from thirty-five to forty fathom long, from the point of the Bastion to the point where the two demigorges meet. See *BASTION*.

CAPITALS, in printing, large, or initial letters, wherein titles, &c. are composed, and with which all periods, verses, &c. commence.

All proper names of men, countries, kingdoms, terms of arts, sciences, and dignities, usually begin with *Capitals*.

The English printers have carried *Capitals* to a pitch of extravagance; making it a rule, to begin almost every substantive with a *Capital*; which is a manifest perversion of the design of *Capitals*, as well as an offence against beauty and distinctness. Some of them begin now to retrench their superfluous *Capitals*, and to fall into the measures of the printers of other nations. See *LETTER*.

CAPITATÆ Plantæ, in botany, are those plants whose flowers are fistular, composed of many edged and hollow little flowers; they were thus called by Mr. Ray, because their scaly calyx (or cup of the flower) most usually swells out into a large and round head, containing within it the pappous seed: as in the carduus, centaur, knap-weed, cinara, cirium, lappa maj. cyanus, &c.

CAPITATION, a tax, or imposition raised on each person, in consideration of his labour, industry, office, rank, &c. This kind of tribute is very antient, and answers to what the Greeks called *επισημασιον*; the Latins *Capita*, *Capitatio*, and *Tributum*, or *Tributum Capitis*, or *Capitulari*; by this term taxes on the person, are distinguished from taxes on merchandise; which were called *Veſtigialia*, *quia veſtebantur*.

CAPITATION also denotes a certain sum of money imposed per head, in exigencies of state.

CAPITE, in law, an antient tenure, whereby a person held of the king immediately, as of his crown; either by knight's-service, or soccage.

By a statute, 12 Car. II. all such tenures by knight's-service of the king, or of any other person, knight's services in *Capite*, or soccage, with all rights, &c. are annulled. See *Soccage*.

*CAPITOL**, *CAPITOLIUM*, in antiquity, a famous fort, or castle, on the *Mons Capitolinus* at Rome, wherein was a temple dedicated to Jupiter, thence also denominated *Capitolinus*, in which the senate antiently assembled; and which still serves as the city-hall, or town-house, for the meeting of the conservators of the Roman people.

* It had its name *Capitol*, from *Caput*, a man's head, said to have been found fresh, and yet bleeding, upon digging the foundation of the temple, built in honour of Jupiter. Arnobius adds, that the man's name was *Telus*, whence *Caput-telium*.

The first foundations of the *Capitol* were laid by Tarquin the elder, in the year of Rome 139. His successor, Servius, raised the walls; and Tarquin the proud finished it, in the year 221. But it was not consecrated, till the third year after the expulsion of the kings, and establishment of the consulate. The ceremony of the dedication of the temple, was performed by the consul Horatius, in 246.

The *Capitol* consisted of three parts; a nave, sacred to Jupiter; and two wings, or isles, to Juno and Minerva: It was ascended to by stairs; Liplius reckons one hundred in number, by reason there were so many in the ascent of the Tarpeian rock. The frontispiece and sides were encompassed with galleries, wherein those who had the honour of a triumph, entertained the senate at a magnificent banquet, after the performance of sacrifice to the gods. Both inside and outside were enriched with infinite ornaments; the statue of Jupiter, with his golden thunderbolt, his scepter and crown, were the most distinguished.

In the same *Capitol* there were likewise a temple to Jupiter the guardian, and another to Juno; with the mint: and on the descent of the hill, was the temple of Concord. The *Capitol* was burnt under Vitellius, and rebuilt under Vespasian. It was burnt a second time by lightning, under Titus, and was again restored by Domitian.

Antiently, the name *Capitol* was likewise applied to all the principal temples, in most of the colonies throughout the Roman empire; as, at Constantinople, Jerusalem, Carthage, Ravenna, Capua, &c.—That of Tholouse, has given the name of *Capitols* to its chevins, or sheriffs.

CAPITOLINE Games, *Ludi*, *CAPITOLINI*, were annual games, or combats instituted by Camillus, in honour of Jupiter *Capitolinus*, and in commemoration of the *Capitol's* not being surprized by the Gauls.

Plutarch tells us, that a part of the ceremony consisted in the publick cryers putting up the *Hetrurians* to sale by auction. They also took an old man, tying a golden bulla to his neck, such as were wore by their children, and exposed him to the publick derision. Pestus says, they dressed him in a pretexta, hung a bulla at his neck; not as accounting him a child, but because this was an ornament of the kings of *Hetruria*.

There was also another kind of *Capitoline* games, called *Agones Capitolini*, instituted by Domitian, and celebrated each five years; wherein there were rewards and crowns bestowed on the victorious poets, and put on their heads by the emperor himself. These games became so celebrated, that the manner of accounting time by lustris, which had obtained till then, was changed; and they began to count by *Capitoline* games, as the Greeks by olympiads. The feast was not for poets alone, but also for athletes, orators, historians, comedians, musicians, &c.

CAPITULAR, or *CAPITULARY*, denotes an act passed in a chapter, either of knights, canons, or religious.

The *Capitularia*, or *Capitulars* of Charlemagne, Charles the bald, &c. are the laws, both ecclesiastical and civil, made by those emperors in the general councils, or assemblies of the people: which was the way the constitutions of most of the antient princes were made; each person present though a *Plebeian*, setting his hand to them.

Some distinguish these from laws; and say, they were only supplements to laws.—They had their name, *Capitulari*, because divided into *Capitula*, chapters or sections.

In these *Capitulars* did the whole French jurisprudence antiently consist.—In process of time, the name was changed for that of *Ordonnances*.

Some distinguish three kinds of *Capitulars*, according to the difference of their subject matter: Those on ecclesiastical affairs, are real canons, extracted from councils; those on secular affairs, real laws; those relating to particular persons, or occasions, private regulations.

CAPITULATION, a treaty made with the garrison, or inhabitants of a place besieged; whereby they surrender themselves up, on certain articles and conditions stipulated with the besiegers.

CAPITULATION, denotes also a kind of treaty, *pacta conventa*, or original contract drawn up by the electors, before the election of an emperor; which the emperor is to ratify before his coronation, and to observe inviolably in the course of his reign.

These imperial *Capitulations* have only been obtained since the time of Charles V. They were occasioned, by the jealousy the German princes had entertained of the too great power of the emperor. Frederic, duke of Saxony, firnamed the *Wise*, passes for the author of the imperial *Capitulations*; he declining the empire, which was offered him after the death of Maximilian, and advising the electors to chuse Charles V. under such conditions as might secure the liberty of the empire.

CAPITULUM, in botany, the head, or compound flower of any plant; being composed of many leaves and threads, or stamina, closely connected in a globous, circular, or discous figure: as the flowers of bluebottles, scabious, carduus, &c.

CAPIVI, see *COPIVI*.

*CAPNOMANCY**, *Καπνομαντια*, a kind of divination by means of smoke, used by the antients in their sacrifices.

* The word comes from the Greek *καπνος*, smoke; and *μαντια*, divination.

The general rule was, when the smoke was thin, and light, and rose straight up, it was a good omen; if the contrary, it was an ill one.

There was also another species of *Capnomancy*, consisting in the observation of the smoke rising from poppy and jessamin seed, cast upon lighted coals.

CAPONIERE, or *CAPONNIERE*, in fortification, a covered lodgment, sunk four or five foot into the ground, encompassed with a little parapet about two foot high, serving to support several plants covered with earth.

The *Caponiere* is large enough to contain fifteen or twenty soldiers; and is usually placed in the glacis on the extremity of the counterſcarp, and in dry moats; having little embrasures for the soldiers to fire through.

*CAPRA**, in astronomy, a denomination given to the star *Capella*: and sometimes also to the constellation *Capricorn*. See *CAPELLA*, and *CAPRICORN*.

* Some represent *Capra*, or the goat, as a constellation in the northern hemisphere, consisting of three stars, comprized between the 4th and 55th degree of latitude. The poets say, it is Amalthea's goat, which suckled Jupiter in his infancy. Horace making mention of it, calls it, *Inſana ſydæra Capræ*.

CAPRA Saltans, or *CAPRÆ Saltantes*, in meteorology, a fiery meteor, or exhalation, which sometimes appears in the atmosphere, and is not fired in a straight line, but with inflexions, and windings in and out, resembling the caperings of a goat.

CAPREOLUS, in botany, the clasper, or tendril, by which vines, pease, and such-like creeping plants, fasten themselves to

to those things which stand near, or are designed to support them.

CAPREOLATÆ Plantæ, are such plants as turn, wind, and climb along the surface of the earth, and sticks or trees, by means of their *Capresili*, or tendrils: as, gourds, melons, cucumbers, &c. **CAPRICORN**, in astronomy the tenth sign of the Zodiac; from which also the tenth part of the ecliptic takes the same denomination.

The character whereby *Capricorn* is represented in astronomical writings is, *vp*.

The antients accounted *Capricorn* the tenth sign, and when the sun arrived thereat, it made the winter solstice, with regard to our hemisphere: but the stars having advanced a whole sign towards the east, *Capricorn* is now rather the eleventh sign; and it is at the sun's entry into sagittary, that the solstice happens: though the ancient manner of speaking is still retained.

This sign is represented on ancient monuments, medals, &c. as having the fore-part of a goat, and the hind-part of a fish; which is the form of an *Ægipan*: and sometimes, simply under the form of a goat.

The stars in the constellation *Capricorn*, in Ptolemy's and Tycho's catalogue, are twenty-eight; in that of Hevelius twenty-nine: though it is to be observed, one of those in the tail, of the sixth magnitude, marked in Tycho's book the twenty-seventh, was lost in Hevelius's time. Mr. Flamsteed, in the Britannic catalogue, gives fifty one stars in *Capricorn*.—The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

Names and Situations of the Stars.	Right Ascension.	Longitude.			Latitude.	Magnitude.

Tropic of CAPRICORN, a lesser circle of the sphere, parallel to the equator; passing through the beginning of *Capricorn*. See **TROPIC**.

CAPRIOLES*, in horsemanship, are leaps which a horse makes in one and the same place, without advancing forwards; and that in such manner, that when he is in the air, at the height of his leap, he jerks or strikes out with his hind legs as near and even together, and as far out as he can stretch them; in which action, he clacks, or makes a noise with them.

* The word comes from *Capriolus*, a diminutive of *Caper*, Goat.

The *Capriole* is the most difficult of all the high raised airs: there are several kinds of *Caprioles*; as, a *right Capriole*, *back Capriole*, *side Capriole*, *brake Capriole*, the *open Capriole*, &c. **CAPSQUARES**, in gunnery, strong plates of iron, which come over the trunnions of a gun, and keep it in the carriage.

These are fastened by hinges to the prize-plate, that they may lift up and down. They form a part of an arch in the middle, to receive a third part of the thickness of the trunnions; for two thirds of them are let into the carriage, and the other end is fastened by two iron wedges, which are called the *fore-locks* and *keys*.

CAPSTAN, a large cylinder, or barrel placed perpendicularly on the deck of a ship, and turned by four levers, or bars which cross it; serving by means of a cable which winds round the cylinder, to draw up vast burdens fastened to the end of the cable.

By the *Capstan* it is, that vessels are drawn ashore, and hoisted up to be refitted; the heaviest goods are unloaded, anchors weighed, and sails hoisted, &c.

There are two *Capstans* in a vessel: the *main Capstan* placed behind the mainmast, standing on the first deck, and reaching four or five feet above the second: this is also called *double Capstan*, because serving two decks for drawing of anchors: and because its force may be doubled by applying hands on each deck. It has bars, whelps, a pannel, &c. for turning and stopping it.—See *Tab. Ship. Fig. 2. n. 112*.

And the *jeer Capstan*, or *little Capstan*, this stands on the second deck, between the mainmast and the mizzen: its use is, chiefly, to heave upon the jeer rope, or to heave upon the viol, to hold off by when the anchor is weighing; and on other occasions where a less force is required, than to weigh the anchors, &c. See *n. 71*.

The French call that an *English Capstan*, where there are only half bars used; and which, for that reason, is only half perforated: this is thicker than the others.

There is also a *flying Capstan*, which may be moved from place to place.

The terms belonging to the use of the *Capstans*, are, *Come up Capstan*, that is, slacken the cable which you heave by; in a like sense they also say, *Launch out the Capstan*.

Paul out the Capstan, signifies, stop it from going back.

CAPSULA*, or **CAPSELLA**, denotes a bag, pouch, or receptacle of divers kinds of things.

* The word is a diminutive of the latin *Capsa*, literally signifying, a little box, or case; particularly a bag, or sachel, wherein boys carry their books, &c. to school.

CAPSULA, among botanists, denotes the seed-vessel of a plant.

Those plants whose seeds are inclosed in *Capsulae* are denominated *Angiospermus*; and those whose seeds have no *Capsulae*, *Gymnospermus*.

CAPSULA Communis, or of the *Porta*, is a membrane arising from the Peritonæum, and inclosing the trunk of the vena porta after its entrance into the liver, as a case, or cover; dividing it self into the same number of branches, and accompanying all, even its smallest ramifications.

The same *Capsula*, or membrane, likewise incloses the *Porus Biliaris*, and other vessels of the liver; whence it takes the name of *Capsula Communis*.

CAPSULA Cordis, a membrane investing the heart: more usually called the *Pericardium*.

CAPSULÆ Atrabiliaræ, in anatomy, called also *Renes succenturiati* and *Glandulæ Renales*; are two glands situate near the kidneys: called *Atrabiliaræ*, from a black liquor found in their cavity, and *Succenturiati* and *Renales*, from their position.

They are about the bigness of a nux vomica; their figures are somewhat various; in some bodies round, in others triangular, square, &c. The membrane wherewith they are covered is very fine: their cavity is pretty large for their bulk. Their use is very obscure; probably it is to secrete the black humour found in their cavity, which being afterwards discharged by their duct into the emulgent, mixes with the blood; and serves, according to some, as a ferment; according to others, only to dilute its thickness: in a fetus, they are almost as big as the kidneys.

CAPSULÆ Seminales, are the same with *Vesiculæ Seminales*. See **VE-SICULÆ Seminales**.

CAPSULA, in chymistry, is an earthen vessel, in form of a pan; wherein things are frequently placed, that are to undergo very violent operations of the fire.

CAPSULATE Plantæ, **CAPSULATÆ Plantæ**, are such as have a tetrapetalous regular flower, consisting of four distinct petals in each flower, and which bear their seeds in short *Capsulae*: by which they are distinguished from the *Siliquosæ*, which have their seed in long cases, or pods. These are more usually called *Plantæ Siliquosæ*.

CAPTAIN, a military officer, whereof there are various kinds, and degrees, distinguished by their commands: as,

CAPTAIN of a Company, or *Troop*, is an inferior officer, who commands a company of foot, or troop of horse, under the colonel.

In the like sense, we say, *A Captain of dragoons*, of grenadiers, of marines, of invalids, &c.

In the horse and foot guards, the *Captains* are stiled *Colonels*; being usually persons of rank, and general officers of the army.

In the colonel's company of a regiment, i. e. the first company, or that whereof he himself is *Captain*, the commanding officer is called *Captain Lieutenant*.

Lieutenant CAPTAIN, is the *Captain's* second; or the officer who commands the company under the *Captain*, and in his absence. See **LIEUTENANT**. In some companies, &c. he is also called *Captain Lieutenant*.

CAPTAIN Lieutenant, is he who commands a troop, or company, in the name and place of some other person, who has the commission, with the title, honour, and pay thereof; but is distinguished withal, on account of his quality, from performing the functions of his post.

Thus, the colonel, being usually likewise *Captain* of the first company of his regiment; that company is commanded by his deputy, under the title of *Captain Lieutenant*.

So in England, France, &c. the king, prince, dauphin, &c. have usually the titles, dignities, &c. of *Captains of the Guards*, *Gens de Armes*, &c. the real duty of which offices, is performed by *Captains Lieutenant*.

Reformed CAPTAIN, is one, who, upon a reduction of the forces, has his commission and company suppressed; yet is continued *Captain*, either as second to another, or without any post or command at all.

CAPTAIN General, of an army, is the general, or commander in chief.

CAPTAIN of Militia, is he who commands a company of trained bands, or a troop of light-horse.

CAPTAIN Bahadur, signifies the Turkish high-admiral. See **BA-SHAW**.

CAPTAIN of a Ship, is a sea officer whereof we make two kinds; the one of a ship of war, the other of a trading vessel: though, in propriety, the title *Captain* belongs only to the commander of ships of war.

CAPTAIN of a Ship of war, is the commanding-officer of a ship, galley, fire-ship, or the like.

CAPTAIN of a Merchant-Ship, is the master thereof; or he who has the command or direction of the ship, her crew, lading, &c. This officer is more usually called the *Master*; especially in ordinary voyages.

On the mediterranean, he is called the *Patron* or *Patroon*; and in long voyages, as to the East Indies, South Sea, &c. the *Captain*.

The proprietor of the vessel appoints the *Captain*, or Master; and the *Captain* is to form the crew, and chafe and hire the pilots, mates, seamen, &c. though when the proprietor and master reside on the same spot, this is usually done in concert with the proprietor.

CAPTION, in law, is when a commission is executed, and the commissioners names subscribed to a certificate, declaring when and where such commission was executed.

The *Captain* usually commences with these words, *Virtute istius commissionis nos*, &c. or, *Executio istius commissionis patet in quadam schedula annexata*, &c. or, *Capt. & cogn. diu*, &c. or, *Capt. fuit hæc respons.*

CAPTIVE, a slave, or person taken by the enemy in war, or by a pirate or corsair. See **SLAVE**, **PIRATE**, &c.

CAPTURE, a prize, or prey; particularly that of a ship taken at sea.

Thus we say, the French *Captures*, to the number of twenty five, were brought into port.

CAPTURE also denotes an arrest, or seizure of a criminal, debtor, &c. at land.

CAPUCHINS *, religious of the order of St. Francis, in its strictest observance.

* The *Capuchins* are thus called, from *Capace*, or *Capucbon*, a stuff cap, or cowl, wherewith they cover their head.

They are clothed with brown, or grey; are always bare-footed; and never to go in a coach, nor ever shave the beard.

The *Capuchins* are a reform made from the order of minors, commonly called *Cordeliers*, set on foot in the sixteenth century, by Matthew Bascbi, a religious observant of the monastery of Montefalcone; who, being at Rome, sad he was advertised several times from heaven, to practise the rule of St. Francis to the letter. Upon this, he made application to pope Clement, in 1525, who gave him permission to retire into a solitude; and not only him, but as many others as would embrace the strict observance: which some did accordingly. In 1528 they obtained the pope's bull. In 1529, the order was brought into compleat form; Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the *Capuchins* by the pope: but in 1545, it was restored to them again with honour. In 1578, there were seventeen general chapters in the order of *Capuchins*.

CAPUT Baronia, the head of the barony, in antient customs, denotes the antient or chief seat, or castle of a nobleman, where he made his usual residence, and held his court; sometimes also called *Caput honoris*, or the head of the honour.

The *Caput baronia* could not be settled in dowry; nor could it be divided among the daughters, in case there were no son to inherit; but was to defend entire to the eldest daughter, *Cæteris filiabus alunde satisfactis*. See **BARONY**.

CAPUT Draconis, or the *Dragon's Head*, in astronomy, the name of the moon's ascending node. See **NODE**.

CAPUT Gallinæ, or *Galli Gallinæ*, cock's head, is a kind of septum, or spongy border, at the extremities or apertures of each of the vesiculae feminales; serving to prevent the seed coming from one side, from rushing upon, and so stopping the discharge of the other.

Some will have its use to be, to prevent the impulse of the seed from dilating the orifices of the vesiculae, and so oozing out, except when assisted by the compression of the surrounding parts; as in copulation: but this, according to Dr. Drake, is rather the office of a distinct caruncle placed at each orifice, and acting as a valve.—See *Tab. Anat. (Splanch) fig. 8. lit. 9.*

CAPUT Mortuum, in chymistry, the fæces remaining of any body, after all the volatile and humid parts, as the phlegm, spirit, salt, &c. have been extracted therefrom, by force of fire.

What remains after distillation, is properly called *Fæces*. This, ere it be *Caput Mortuum*, must likewise have passed the retort or open fire.

The *Caput mortuum*, called also *Terra dammata*, is found in form of a friable, porous matter, without taste or smell: it is ranked among the chymical elements; and supposed to constitute the dry, fixed, earthy, and solid part of all mixed bodies. As an element, it is more commonly expressed by the name *Earth*.

It is what the chymists call a *passive Element*, or *Principle*; serving as the basis or support of the active ones.

The term is sometimes more immediately restrained to the remains of vitriol, after distillation; otherwise called *Cælothar Vitrioli*.

The *Caput mortuum* is never pure, but there is still some active principle remaining in it, and particularly a fixed salt. See **SALT**. Thus the *cælothar vitrioli*, exposed to the air, is reconverted into vitriol.

CAR, or **CARR**. See the article **CARR**.

CARABE, or **KARABE**, denotes yellow amber. See **AMBER**.

CARABINE, a small sort of fire-arm, shorter than a fusil, and carrying a ball of twenty four in the pound; born by the light horse, hanging at a belt over the left shoulder.

The *Carabine* is a kind of medium between the pistol, and the musquet; and bears a near affinity to the harquebus, only that its bore is smaller.

It was formerly made with a match lock, but of late only with a flint lock.

The barrel is two foot and a half long, and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, a sort of light horse, carrying longer *Carabines* than the rest; and used sometimes on foot. See **CARABINE**.

The French, of late days, have formed entire cors of these *Carabineers*, which cannot but have good effect; this being a sort of soldiery chosen out of the whole cavalry, and better paid than the rest.—There are but few of them in the English army.

CARACOD *, in the manège, a motion which a cavalier makes half round; or a half turn from left to right; changing hands; that his enemy may be uncertain on which side he intends to attack: whether in front, or flank.

* The word comes from the Arabic *Garagel*, and that from the Hebrew, *Carac*, *involvere*: but we have it immediately from the Spanish; where *Caracol* signifies properly a snail, and figuratively the evolution described above.

CARACOL, is also the half turn each horseman in an army makes after his discharge, to pass from the front of the squadron to the rear.

CARACOL, is sometimes also used in architecture, for a staircase in a helical, or spiral form.

CARACT, * or **CARAT**, a denomination given to the weight, which expresses the degree of goodness, fineness, and perfection, or imperfection of gold. See **GOLD**.

* The word is also written, *Caratæ*, *Carrat*, *Karraß* and *Karrot*. Its original is contended: Menage, after Alciat, derives *Carat* from the Greek *καρατιον*, which was a kind of small weight: Savot, with more probability, from *καρπεν*, a tribute-penny, or small coin struck for that purpose; urging, that as the fineness of silver is denominated from a coin called a *peny*; so it is most likely the fineness of gold should be estimated from a gold coin, in former days called *Carat* from *Cbaratzion*. Others derive the word simply from *Cbarader*; but we chuse rather to follow Kennet, who derives it from *Caratæ*, a term which this author observes antiently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold, and the gravity of diamonds.

The Mint-men fix the highest purity and perfection of gold at twenty-

ty-four *Caratils*; and the several degrees are estimated from the divisions hereof, which are called *Grains*: but it is to be observed, that what care soever is taken in purifying gold, to clear it from dross, it can never be brought to twenty-four *Caratils*; but still comes short, at least $\frac{1}{2}$ of a *Caratil*, or a grain: this grain they call a *sixteenth*; and this sixteenth they subdivide into two eighths; and each of those eighths into two sixteenths: On which calculation, they say, gold may be purified as far as the first sixteenth of the second eighth, but no further.

Gold of twenty two *Caratils*, is that which has twenty-two parts of fine gold, and two of silver, or other metal; or that which in refining loses two parts in twenty-four of its weight.

The goldsmiths generally work in gold of twenty-two *Caratils*: by the laws of France they are prohibited from working in gold below twenty-three *Caratils*.

Caratil fine, as above, is the twenty-fourth part of the goodness of a piece of pure gold.

Caratil price, is the twenty-fourth part of the value of an ounce or mark of gold.—They also sometimes say, the *Caratil weight*, which is the twenty-fourth part of the weight of the ounce or mark. Two troy grains make a *Caratil* grain.

CARACT,* is also the weight used in weighing diamonds, pearls, and precious stones; where it consists of four grains.

* In this sense, the word is by some supposed to be derived from the Greek *καρσιον*, a fruit which the Latins call *Siligua*, and we *Carab bean*; each of which may weigh about four grains of wheat: whence the Latin *siligua* has also been used for a weight of four grains.

CARAITES, a sect among the ancient Jews; whereof there are still some subsisting in Poland, Russia, Constantinople, Cairo, and other places of the Levant; whose distinguishing tenet and practice it is, to adhere closely to the words and letter of the scripture, exclusive of allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, observes, that of all the heresies among that people, before the destruction of the temple, there is none now left but that of the *Carrains*, a name derived from *micra*, which signifies the pure text of the bible; because of their keeping to the Pentateuch, observing it to the letter, and rejecting all interpretations, paraphrases, and constitutions of the rabbins.

Aben Ezra, and some other rabbins, treat the *Caraites* as Sadducees; but Leo de Juda calls them, more accurately, *Sadduces reformed*; in regard they believe the immortality of the soul, paradise, hell, resurrection, &c. which the ancient Sadduces denied. He adds, however, that they were doubtless originally real Sadduces, and sprung from among them.

M. Simon, with more probability, supposes them to have risen hence, That the more knowing among the Jews, opposing the dreams and reveries of the rabbins, and using the pure text of scripture to refute their groundless traditions, they had the name *Carrains* given them; which signifies as much as the barbarous latin, *scripturarii*; i. e. people attached to the text of scripture. The other Jews give them the odious name *Sadduces*, from their agreement with those sectaries on the head of traditions.

Scaliger, Vossius, and Spanheim, rank the *Caraites* among the Sabaeans, Magi, Manichees, and Mussulmen, but by mistake: Wolfgang Fabricius, &c. say, the Sadduces and Esseni were called *Caraites*, in opposition to the Pharisees: others take them for the doctors of the law so often mentioned in the gospel: but these are all conjectures. Josephus and Philo make no mention of them; which shews them to be more modern than either of those authors. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemara; perhaps not till after the compiling of the Mishna in the third century.—The *Caraites* themselves pretend to be the remains of the ten tribes led captive by Salmanassar.

Wolffius, from the *Memoirs of Mardochæus*, a *Carait*, refers their origin to a massacre among the Jewish doctors, under Alexander Jannæus, their king, about one hundred years before Christ: for that Simeon, son of Schetach, and the queen's brother, making his escape into Egypt, there forged his pretended traditions; and at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notices which God, he said, had communicated by the mouth of Moses, whose depositary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the *Caraites*, and *Traditionaries*: among the first, Juda, son of Tabbai, distinguished himself; among the latter, Hillel. Wolffius reckons not only the Sadduces, but also the Scribes, in the number of *Caraites*. But the address of the Pharisees prevailed against them all; and the number of *Caraites* decreased: Anan indeed, in the eighth century, retrieved their credit a little; and rabbi Schalomon in the ninth. Matters went pretty well with them till the fourteenth, but since that time they have been on the declining hand.

The *Caraites* are but little known; their works coming only into very few hands, even among the greatest Hebraists. Buxtorf never saw more than one; Selden two; but M. Trig-

land says, he has recover'd enough to speak of them with assurance. He asserts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation: some maintaining their necessity from tradition; whilst others, keeping close to the written law, set them aside; and it was from these last that *Caraitism* commenced. He adds, that after the return from the Babylonish captivity, the observation of the law being to be re-established, there were several practices found proper for that end; and these, once introduced, were looked upon as essential, and appointed by Moses; which was the origin of Pharisaism; as a contrary party, continuing to keep close to the letter, founded *Caraitism*.

The modern *Caraites*, Leo of Modena observes, have their synagogues, and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term *Rabbanim*, or followers of the Rabbins: these hate the *Caraites* mortally; refusing to ally, or even to converse with them, and treating them as *manzerim*, or bastards; because of their rejecting the constitutions of the rabbins relating to marriages, repudiations, purifications of women, &c. This aversion is so great, that if a *Carait* would become a rabbinist, he should never be received by the other Jews.

The *Caraites*, however, do not absolutely reject all kind of traditions; but only such as do not appear well grounded. Selden, who is very express on this point, in his *Uxor Hebraica*, observes, that besides the mere text, they have certain interpretations which they call *hereditary*, and which are proper traditions. Their theology only seems to differ from that of the other Jews, in that it is purer, and clearer of superstition: they give no credit to the explications of the Cabalists, chimerical allegories, nor to any constitutions of the Talmud, but what are conformable to the scripture, and may be drawn from it by just and necessary consequences: of these we shall give three notable instances.

The first relating to the *Meazuzet*, or parchments which the Jews tie at all the gates through which they use to pass. The second regarding the *Thephillin* or phylacteries, mentioned in the new testament: and the third, the prohibition of eating milk, with flesh. The two first, the Jews pretend, are formally ordained in Deuteronomy, where it is said, "Thou shalt bind them as a sign on thy hands, and they shall serve thee as frontlets (headfalls) between thy eyes; thou shalt write them on the posts of thy house." The *Carait* Aaron, in his comment on these words, maintains, they are not to be taken literally, as the rabbins do, but figuratively; as intimating, that the Jews, whether entering or going out, should be always mindful of them. For the *Thephillin*, the *Caraites* rally the rabbinists on their praying with their phylacteries, or thongs of leather fastened to their forehead; comparing them to bridled asses. This passage the *Caraites* interpret figuratively; and in their interpretation agree with St. Jerom, who takes notice of the delusion of the Pharisees, "in writing the decalogue on parchment, rolling it up, and tying it to their forehead with thongs, to have it always before their eyes." For the third point, the rabbins say, it is commanded in that text, "Thou shalt not see a kid in his mother's milk;" but the *Caraites* get clear of it by explaining the passage by another, "Thou shalt not kill the mother when with young," which is natural.—Nor have the Jews any thing to object in behalf of their interpretation, but its being that of their doctors. Thus the *Caraites* exempt themselves from an infinite number of ceremonies and superstitions, which the rabbins have established among the other Jews.

Yet, in many things, they retain all the superstition of the rabbins. Schupart, in his treatise *de secta Karaorum*, treating of their dogmata, observes, that they are in all respects as precise and ceremonious as the most rigid traditionary, in what relates to the observation of the sabbath, passover, feast of atonement, of tabernacle, &c. That they observe prayers and fastings; and wear the *tzitzit*, or pieces of fringe, on the corners of their garments. They hold, that all sin is effaced by repentance; in which they differ from the rabbins, who hold, that some are only effaced by death. As for circumcision, they do not believe it necessary, with the traditionaries, that there be blood shed; Add, that when a child dies before it be eight days old, the rabbinists circumcise it after it is dead, that it may not appear uncircumcised at the resurrection; whereas the *Caraites*, when they perceive the child in danger, chuse rather to circumcise it before the eighth day. In matters of divorce, the *Caraites* agree with the other Jews; and observe the same rules and restrictions in the killing and dressing of beasts; but they differ from them in the kinds of legal impurities and pollutions.

Peringer observes of the *Caraites* in Lithuania, that they are very different, both, in aspect, language, and manners, from the rabbinists, wherewith that country abounds. Their mother tongue is the Turkish; and this they use in their schools and synagogues. In visage they resemble the Mahometan Tartars. Their synagogues are posited north and south; and the reason they give for it, is, that Salmanassar brought them northward: so that, in praying, to look to Jerusalem, they must turn to the south. He adds, that they admit all the books of the old testa-

ment; contrary to the opinion of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a *Caraites*, reduces the difference between them and the rabbinites to three points: 1st, In that they deny the oral law to come from Moses, and reject the cabbala. 2d, In that they abhor the talmud. 3d, In that they observe the feasts, as the sabbaths, &c. much more rigorously than the rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited almost to infinity.

CARANNA, a hard, brittle, refinous gum, brought from some parts of the West Indies, as Carthage and New Spain; of an aromatic flavour, and sometimes used in medicine, as a cephalic.

CARAT, CARRAT, or CARACT. See the article CARACT.

CARAVAN,* or CARAVANNE, in the east, a troop, or company of travellers, merchants, and pilgrims, who for their greater security march in a body, through the deserts, and other dangerous places, infested with Arabs and robbers.

* The word comes from the Arabic *Cairawan*, or *Cairoan*; and that from the Persian *Kirvan*, or *Cârân*, negotiator, a trader or dealer. V. Periti. Itin. Mund. ed. Hyde, p. 61.

There is a chief, or Aga, who commands each *Caravan*, and has under him a number of janizaries, or other forces, sufficient for their defence. The *Caravans* incamp every night near wells, or rivulets known to the guides; and observe a discipline as regular as in war. They chiefly use camels for their vehicles, by reason of their enduring a world of fatigue, eating little, and passing three or four days without drinking.

The grand signior gives one fourth part of the revenues of Egypt, to defray the expence of the *Caravan* that goes yearly to Mecca, to visit Mahomet's tomb: the devotees, in this *Caravan*, are from forty thousand to seventy thousand; accompanied with soldiers to protect them from the pillage of the Arabs, and followed with eight or nine thousand camels, laden with all necessary provisions for so long a passage across deserts.

Days journeys are distinguished in the east, into journeys of horse-*Caravans*, and *Caravans* of camels: those of horses are equal to two of camels. There are several *Caravans* which go yearly from Aleppo, Cairo, and other places, to Persia, Mecca, Thebes, &c. There are also *sea Caravans* established on the same footing, and for the same purposes: such is the *Caravan* of vessels, from Constantinople to Alexandria.

CARAVAN, is also an appellation given to the voyages, or campaigns, which the knights of Malta are obliged to make at sea, against the Turks and Corsairs; in order to arrive at the commandries and dignities of the order.—They are thus called, because the knights have frequently seized the *Caravan* going from Alexandria to Constantinople.

CARAVANSERA,* a large public building, or inn, destined to receive and lodge the *Caravans*.

* The word comes from the Arabic *Cairawan*, or Persian *Karwan* or *Cârân*, a *Caravan*, and *Serai*, a large house.

Of these *Caravanserais*, or, as Chardin calls them, *Carouanferrai*, there are a great number throughout the east; erected out of the charity and magnificence of the princes, &c. of the several countries.

Those of Schiras and Casbin, in Persia, are said to have cost sixty thousand crowns each. They are open to people of all religions and countries, without any questions asked, or any money required.

The *Caravanserais* are usually huge square buildings, with a spacious court in the middle thereof. They are encompassed with galleries and arches, under which runs a kind of banquettes, or elevation, some feet high, where travellers rest themselves, and make their lodgings as well as they can; their baggage, and the beasts that carry them, being fastened at the foot of the banquettes. Over the gate, there are frequently a sort of little chambers; which the *Caravanseraskier* lets out, at a very dear rate, to such as have a mind to be to themselves.

Though the *Caravanserai* serve in lieu of inns; yet there is this essential difference between them and our inns, that the traveller finds nothing at all in the *Caravanserai*, neither for himself nor his cattle; but must carry all his provisions and necessaries with him. They are chiefly built in dry, barren, desert places; and are generally furnished with water from a great distance, and at a vast expence: there being no *Caravanserai* without its well of water. There are several of them in cities: where they serve not only as inns, but as shops, warehouses, and even exchanges.

There are few cities in the east without their *Caravanserais*; especially within the dominions of Turkey, Persia, and the great Mogul. Those of Constantinople, Ispahan, and Agra, the capitals of three empires, are distinguished for their magnificence and commodiousness.

In Turkey, none but the grand signior's mother and sister, with the visiers and bakhwas, who have been in three battles against christians, are allowed to build a *Caravanserai*.

CARAVANSERASKIER, the director, steward, or intendant of a *Caravanserai*.

At Ispahan, there are *Caravanserais* in manner of halls, or exchanges, where goods are laid up, and exposed to view; for which the *Caravanseraskier* is accountable, in consideration of a certain fee.

CARAWAY, or CARUI, a medicinal feed, produced from a plant of the same name, by botanists called *Carui officinarum*, or *Cuminum Præteritæ*.

The seed of the carvi or *Caraway*, is narrow, length, furrowed on the back, and of a brisk aromatic taste.

It is one of the greater hot feeds, and is esteemed stomachic, and diuretic; it dispels wind, and strengthens digestion, &c. The English and Germans make great use of it; particularly in biscuits, comfits, feed cakes, and other foods, and confections.

CARBUNCLE,* among ancient naturalists, is a sort of stone, whereof Pliny and Theophrastus relate many fabulous wonders.

* The name is formed of the latin *Carbunculus*, q. d. a burning-coal: the Greeks also call it *αἰσθητός*, coal. Pliny, treating of the *Carbuncle*, distinguishes twelve sorts of it.

Many of the antients, and some of the moderns after them, have supposed the *Carbuncle* to be taken from the dragon's head; and we read of many a cavalier, who went to combat with dragons, on purpose to gain this invaluable jewel.—Vartoman assures us, that the King of Pegu used no other light in the night-time, but that of his *Carbuncle*, which cast a blaze like that of the sun.

CARBUNCLE, among modern lapidaries, is a stone of the ruby kind, very rare, and of a rich glowing blood red colour.

Some say it is not entitled to the appellation unless it exceed twenty carats weight. Otherwise it is only a ruby: See *Supplement*, article CARBUNCULUS.

CARBUNCLE, in medicine, is a malignant tumor, arising sometimes on one part, and sometimes on another; accompanied with a painful heat, mortification, lividness, and at last a blackness of the part. See ANTHRAX.

The Greeks call it *Anthrax*, the Latins *Carbunculus*, sometimes also, *Carbo*; and the French *Charbon*, all importing coal, from the resemblance of its scab to a coal of fire. It is sometimes pestilential, and sometimes not.—When it arises without pustles, it is properly called *Pruna*; when with, *Ignis Persicus*.

It usually begins with one or more pustles, under which is formed a putrid ulcer; sometimes with a scab, without any pustle; the ulcer being formed under the scab. Within the tumor is a kernel, very painful; sometimes red, and sometimes livid, or blackish.

The *Carbuncle* is owing to a sharp, caustic, malignant, saline humour, which gnaws and corrupts the part whereon it is discharged.

CARBUNCLE, in heraldry, a charge, or bearing, consisting of eight radii, or spokes; four whereof make a common cross, and the other four a saltire; see Tab. Herald. Fig. 13.

Some call these radii *Buttons*, or *Staves*; because round, and enriched with buttons, or pearled, like pilgrims staves; and frequently tipped, or terminated with flower-de-luces. Others blazon them, royal scepters, placed in saltire, pale and fesse.

CARBUNCULATION, the blasting, or scorching of the new-sprouted buds of trees, or plants, either by excessive heat, or excessive cold.

CARCASSE, the corpse, or body of a dead animal. Thus, we say, *The Carcasses* of the soldiers, horses, &c. were seen long afterwards on the field of battle.

The *Carcasse* of a fowl, capon, partridge, leveret, rabbit, &c. is what remains thereof, after the four members, or limbs, have been cut off, viz. the legs and wings.

CARCASSE, in architecture, is the shell, or ribs of a house; containing the partitions, floors, rafters, &c. made by the carpenter, &c. The *Carcasse* is otherwise called the *Framing*; see FRAMING.

CARCASSE,* or CARCASS, in war, a kind of bomb, usually oblong, or oval, rarely circular; consisting of a shell, or case, sometimes of iron, with holes; but more commonly of a coarse strong canvas, pitched over, and girt with iron hoops; filled with combustible matters, as hand grenades, ends of muskets, loaded pistols, and preparations of gunpowder, &c. Its use is to be thrown out of a mortar, to set houses on fire, and do other execution.

* It has the name *Carcasse*, because the circles which pass from one ring, or plate, to the other, seem to represent the ribs of a human *Carcasse*.

CARCINOMA,* *Καρκίνωμα*, in medicine, a tumor more usually called a *Cancer*. See CANCER.

* The word comes from *καρκίνος*, *Cancer*, and *μαζα*, *deposited*, to feed upon.

CARCUS, in war, the same as *Carcasse*; see CARCASSE.

CARDAMOMUM, or CARDAMOM, a medicinal feed, of the aromatic kind, contained in capsule, or pods, brought from the East Indies; and used in the composition of Venice treacle, and many other medicines.

This feed is distinguished into three kinds, according to the several sizes of the pods; viz. *major*, *minor*, and *maximum*, or great, lesser, and greatest: but the taste, smell, colour, and form of the grain, is the same in all; being of a purple colour, angular, of a sharp biting taste, and a strong penetrating smell.—The last kind is also called *grains of paradise*; but the first excels the rest, both

both in smell, taste, and virtue. It is this that enters the composition of the Theriaca.

The *Cardamoms* warm, and deterge: they strengthen the nobler parts, dissipate wind, and help digestion; and are used in diseases of the brain, stomach, and womb.

CARDIACS. * **CARDIACA**, in a general sense comprehend all medicines beneficial to the heart; whether internally, or externally applied.

* The word comes from the Greek *καρδια*, *Cor*; the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits, and give present strength, and cheerfulness. These amount to the same with what are popularly called *Cardials*.

Cardials are remedies antiently supposed to exert themselves immediately in comforting and strengthening the heart: but the modern physicians rather suppose them to produce their effect, by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated; and the tone and elasticity of the fibres of the vessels restored: the consequence of which, is a more easy and brisk circulation.

CARDIACUS Plexus, in anatomy, a Plexus, or piece of network, formed of a ramification of the Par vagum, or eighth pair of nerves.

CARDIALGIA. * **CARDIALGY**, in medicine, a violent sensation of heat, or acrimony, felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitations of the heart, fainting, and a propensity to vomit: better known by the name of *cardiac passion*, or *heart-burn*.

* The word is compounded of the Greek *καρδια*, which denotes either the heart, or the left orifice of the stomach, and *αλγος*, pain.

It is supposed to be occasioned by some sharp humour, or acrimonious aura, which pricks and velleicates that orifice, and the adjoining parts.

Blancard makes the disease consist in a gnawing and contraction of the par vagum, and the intercostal nerves implanted in the stomach; proceeding from a pungent velleicating matter in the stomach itself: which, by means of the consent of parts, affects the heart; straining and contracting it so, as sometimes to occasion swooning.

CARDINAL. * a term serving to express the relation, or quality, of prime, principal, or most considerable.

* The word is formed of the Latin *Cardo*, a hinge; it being on these fundamental points, that all the rest of the same kind are supposed to turn.

Thus justice, prudence, temperance and fortitude, are called the four *Cardinal Virtues*, as being the basis of all the rest.

CARDINAL Points, in cosmography, are the four interfections of the horizon, with the meridian, and the prime vertical circle. See **POINT**.

Of these, two, *viz.* the interfections of the horizon and meridian, are called *North* and *South*, with regard to the poles they are directed to.

To determine the places of these points, see **MERIDIAN Line**. The other two, *viz.* the interfections of the horizon and first vertical, are called *East* and *West*.

The *Cardinal Points*, therefore, coincide with the four *Cardinal* regions of the heavens; and are 90° distant from each other. The intermediate points are called *Collateral Points*.

CARDINAL Points of the Heaven, or, of a *Nativity*, are the risings, and setting of the Sun, the Zenith, and Nadir.

CARDINAL Winds, are those that blow from the *Cardinal* points.

CARDINAL Numbers, in grammar, are the numbers one, two, three, &c. which are indeclinable; in opposition to the ordinal numbers, first, second, third, fourth, &c. See **NUMBER**.

CARDINAL. * is more particularly used for an ecclesiastical prince, one who has a voice, both active and passive, in the Roman conclave, at the election of a pope.

* Some say, the *Cardinals* were so called from the Latin *Incardinatio*, which signifies the adoption any church made of a priest of a foreign church, driven thence by misfortune; and add, that the use of the word commenced at Rome and Ravenna; the revenues of the churches of which cities being very great, they became the common refuge of the unhappy priests of all other churches.

The *Cardinals* compose the pope's council, or senate: in the Vatican is a constitution of pope John, which regulates the rights and titles of the *Cardinals*; and which declares, that as the pope represents Moses, so the *Cardinals* represent the seventy disciples, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their first institution, were only the principal priests, or incumbents of the parishes of Rome. In the primitive church, the chief priest of a parish, who immediately followed the bishop, was called *Presbyter Cardinalis*; to distinguish

him from the other petty priests, who had no church, nor preferment: the term was first applied to them in the year 150; others say, under pope Silverius, in the year 300. These *Cardinal* priests were alone allowed to baptize, and administer the eucharist. When the *Cardinal* priests became bishops, their *Cardinalate* became vacant; they being then supposed to be raised to a higher dignity.—Under pope Gregory, *Cardinal* priests, and *Cardinal* deacons, were only such priests or deacons, as had a church or chapel under their particular care: And this was the original use of the word. Leo IV. in the council of Rome held in 853, calls them *Presbyteros sui Cardinalis*; and their churches, *Parochias Cardinales*.

The *Cardinals* continued on this footing till the eleventh century: but as the grandeur and state of his holiness became then exceedingly augmented, he would have his council of *Cardinals* make a better figure than the antient priests had done. It is true, they still preserved their antient title; but the thing expressed by it was no more. It was a good while, however, ere they had the precedence over bishops, or got the election of the pope into their hands: but when they were once possessed of those privileges, they soon had the red hat and purple; and growing still in authority, they became at length superior to the bishops, by the sole quality of being *Cardinals*.

Du Cange observes, that originally there were three kinds of churches: the first or genuine churches were properly called *Parishes*; the second *Deaconries*, which were chapels joined to hospitals, and served by deacons; the third were simple *Oratories*, where private masses were said, and were discharged by local and resident chaplains. He adds, that to distinguish the principal, or parish churches from the chapels, and oratories, the name *Cardinalis* was given them. Accordingly, parish-churches gave titles to *Cardinal* priests; and some chapels also, at length, gave the title of *Cardinal Deacons*.

Others observe, that the term *Cardinal* was given not only to priests, but also to bishops and deacons who were attached to certain churches; to distinguish them from those who only served them *en passant*, and by commission. Titular churches, or benefices, were a kind of parishes, *i. e.* churches assigned each to a *Cardinal* priest; with some stated district depending on it, and a font for administering of baptism, in cases where the bishop himself could not administer it.—These *Cardinals* were subordinate to the bishops; and accordingly, in councils, particularly that held at Rome in 868, subscribed after them. It was not, however, only at Rome, that priests bore this name; for we find there were *Cardinal* priests in France: thus, the curate of the parish of St. John de Vignes, is called in old charters the *Cardinal* priest of that parish.

The title of *Cardinal* is also given to some bishops, *quatenus* bishops; *e. gr.* to those of Mentz and Milan: the archbishop of Bourges is also, in antient writings, called *Cardinal*; and the church of Bourges a *cardinal church*. The abbot of Vendome calls himself *Cardinalis Natus*.

The *Cardinals* are divided into three classes, or orders; containing six bishops, fifty priests, and fourteen deacons; making in all, 70: which constitute what they call the *Sacred College*. The *Cardinal* bishops, who are, as it were, the pope's vicars, bear the titles of the bishopricks assigned to them; the rest take such titles as are given them: the number of *Cardinal* bishops has been fixed; but that of *Cardinal* priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two, or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV. without any regard to that restriction, raised them again to fifty-three, and Leo to sixty-five. Thus, as the number of *Cardinal* priests was antiently fixed to twenty-eight, new titles were to be established, in proportion as new *Cardinals* were created.—For the *Cardinal* deacons, they were originally no more than seven, for the fourteen quarters of Rome; but they were afterwards increased to nineteen, and after that were again diminished.

According to Onuphrius, it was pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the senate of *Cardinals*; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the *Cardinals*, exclusive of the clergy, in the time of Alexander III. in 1160. Others go higher still, and say, that Nicholas II. having been elected at Sienna, in 1058, by the *Cardinals* alone, occasioned the right of election to be taken from the clergy, and people of Rome; only leaving them that of confirming him by their consent; which was at length, however, taken from them. P. Papebroch conjectures, that it was Honorius IV. who first introduced bishops into the sacred college; by admitting the bishops suffragans of the pope, to whom, of right, it belonged to name him; and of these constituting the first class of *Cardinals*.

The *Cardinals* began to wear the red hat at the council of Lyons, in 1243. The decree of pope Urban VII. whereby it is appointed, that the *Cardinals* be addressed under the title of *Eminence*, is of the year 1630: till then they were called *Illustrissimi*.

CARDINAL has also been applied to secular officers.

Thus

CAR

Thus, the prime ministers in the court of the emperor Theodorus, are called *Cardinales*: Calliodorus, L. VII. *Formul.* makes mention of the *Cardinal* Prince of the city of Rome; and in the list of officers of the duke of Bretagne, in 1447, we meet with one Raoul de Thorel, *Cardinal* of Quillart, chancellor, and servant of the viscount de Rohan: which shews it to have been an inferior quality.

CARDING, in the manufactures, a preparation of wool, cotton, hair or flax, by passing it between the iron points, or teeth, of two instruments, called *Cards*, to comb, disentangle, and range the hairs or fibres thereof; and to dispose it for spinning, &c.

Before the wool be *carded*, it is oiled, or greased with oil; whereof, one fourth of the weight of the wool is required, for wool destined for the woof of stuffs; and one eighth for that of the warp. See **CLOTH**.

CARDO, in anatomy, the second vertebra of the neck; so called, because the head turns upon it.

CARDS,—*Playing CARDS*, are little pieces of fine thin pastboard, whereon are printed divers points and figures; a certain number, or assemblage of which, serve for the performance of divers games: as basset, ombre, piquet, whisk, &c.

The method of making *playing Cards*, seems to have given the first hint to the invention of printing; as appears from the first specimens of printing at Haerlem, and those in the Bodleian library.

Making of CARDS.—The cutting of the moulds, or blocks, for these *Cards*, is precisely the same as that used for the first books; and a sheet of wet or moist paper is laid on the form or block, which is first lightly brushed over with an ink, made of lamp-black mixed with starch and water; and then rubbed off with a round list, in the hand. The *Court-Cards* they colour by help of several patterns, called *Stencils*; consisting of papers cut through with a penknife; within the apertures, or incisions of which, the several colours, as red, &c. are severally applied; (for at the first printing, the *Card* has only a mere out-line.) These patterns are painted with oil colours, to keep them from wearing out by the brushes: being laid on the pastboard, they slide a brush full of colour loose over the pattern; which leaving the colour within the apertures, forms the face or figure of the *Card*.

This, very probably, was the way of their first printing at Haerlem; as might have been discovered long ago, if it had been considered, that the great letters in our old manuscripts of nine hundred years ago, are apparently done by the illuminers, after this method of *Card-making*.

CARDS, in commerce, and the manufactures; see **CARDING**.

CARDUUS, in natural history and botany, a name common to divers species of plants, in English called *Thistles*.

The plants of this class most in use, are the *Carduus Benedictus*, and *Carduus Fullonum*. See *Supplement*, article **CARDUUS**.

CARDUUS Benedictus, is a medicinal plant, of the thistle kind, chiefly used in infusion, as a gentle emetic, in fevers and certain nauasas.

Antiently it was much in vogue, as a cardiac, sudorific, and alexipharmic; and in those qualities, it was prescribed in many cases: but it is now succeeded by other medicines less nauseous, and more effectual; though still retained in some of the official compositions, with those intentions.

Some distil a water from it, which they use in cordial and sudorific potions.

CARDUUS Fullonum, is also called the *Fuller's Weed*, or *Teazle*. See **TEAZLE**.

CAREENING, * a term, in the sea language, used for the laying a vessel on one side, to caulk, stop up leaks, and refit or trim the other side.

* The word comes from the French *Carener*, which signifies the same, formed of the Latin *Carina*, the keel of a ship.

A ship is said to be brought to a *Careen*, when the greatest part of her lading, &c. being taken out, and a pontoon, or another vessel lower than herself, laid by her side, she is haled down to it as low as occasion requires, v. g. a fourth or fifth strake; and there kept, by the weight of ballast, ordnance, &c. as well as by ropes, lest it should strain her masts too much.

This is done with design to trim her sides, or bottom, to caulk her seams, or to mend any fault she has under the water. Hence, when a ship lies on one side in sailing, she is said to *fall on the Careen*.

Ships of war are generally *careened* every three years.

The *Half Careen*, is when they can only *careen* half the ship; not being able to reach so low as the bottom of the keel.

CAREER, or **CARRIER**, in the manage, a place inclosed with a barrier, wherein they run the ring.

The word is also used for the race, or course of the horse itself, provided it do not exceed two hundred paces.

In the antient circus, the *Career* was the space the bigæ, or quadrigæ, were to run at full speed, to gain the prize. See **CIRCUS**.

CAREER, in falconry, is a flight or tour of the bird, about one hundred and twenty yards.

CAR

If the mount more, it is called a *double Career*; if less, a *semi-Career*.

CARET, in grammar, a character of this form, (') denoting that there is something inserted, or interlined, which should regularly have come in where the character is placed.

CARGO, the lading or freight of a ship. See **FREIGHT**.

The *Cargo* of this vessel is of such or such a commodity. This is the proper season for a *Cargo* of codfish, of wines, &c.

CARGO is sometimes also used for an invoice of the goods where-with a ship is laden. See **INVOICE**.

CARIATIDES, or **CARIATES**, in architecture; see **CARYATIDES**.

CARICOUS, * or **CARYCOUS Tumor**, a swelling resembling the figure of a fig; such as are frequently found in the piles.

* The word comes from *Carica*, a kind of fig; which is from *Carya*, a country where they are frequent, and from whence they are sometimes brought.

CARIES, in medicine, a solution of continuity in a bone, attended with a waste of its substance, occasioned by some acrimonious matter corroding the same.

The *Caries*, is a kind of rotteness, or putrefaction peculiar to the hard, or bony parts of the body; answering to a gangrene or mortification in the soft, or fleshy part: or, according to others, to an abscess, or ulcer therein.

Caries arises either from a constant afflux of vicious humours, or from their extreme acrimony; or from a bruise, compound fracture, luxation, ulcer, venereal disorder, corrosive medicines, or from their being stripped or laid bare of their flesh, and long exposed to the air, &c.

The usual medicines in a *Caries*, are tinctures of euphorbium, myrrh, and aloes; or powders of the same, with the addition of iris, birthwort of either kind, gentian, &c. and particularly the powder of diapente. After using the tinctures, the powders are applied on lint, in form of a pledget. An actual cautery, applied to the carious part through a canula, &c. is frequently found successful.

Anatomists, in dissecting of bodies, frequently find *carious* bones; particularly those of the jaws, legs, &c. where nothing of that kind was suspected during the person's life-time; nor any disorder felt therefrom: Mr. Checiden conjectures, that the cure of a *carious* bone might be directly attempted, without waiting, as our surgeons usually do, for an exfoliation.

CARINA, a Latin term, properly signifying the keel of a ship; or that long piece of timber running along the bottom of the ship, from head to stern; upon which the whole structure is built, or framed. See **KEEL**.

CARINA, is also frequently used for the whole capacity or bulk of a ship; containing the hull, or all the space below the deck.

Hence, the word is also sometimes used, by a figure, for the whole ship.

CARINA, is also used in the antient architecture.—The Romans gave the name *Carina* to all buildings in form of a ship, as we still give the name *Nave*, to the middle or principal vault of our Gothic churches; because it has that figure.

CARINA, among anatomists, is used for the fibrous rudiments, or embryo of a chick, appearing in an incubated egg.

The *Carina* consists of the entire vertebrae, as they appear after ten or twelve days incubation.

It is thus called, because crooked, in form of the keel of a ship. Botanists, also for the like reason, use the word *Carina*, to express the lower petalum of a papilionaceous flower.

CARINÆ, were also weepers; or women hired, among the antient Romans, to weep at funerals: they were thus called from *Caria*, the country whence most of them came. See **FUNERAL**.

CARIPI, * a kind of cavalry in the Turkish army. The *Caripi*, to the number of about one thousand, are not slaves, nor bred up in seraglios or seminaries, like the rest; but are generally Moors, or renegade Christians, who having followed adventures, and being poor, and having their fortune to seek, by their dexterity and courage have arrived at the rank of horse guards to the grand signior. They march with the Ulufagi on the left hand, behind him; their pay is twelve aspers per day.

* The word *Caripi* signifies poor, and stranger; an appellation said by Chalcondylas, to have been given them because chiefly brought out of Egypt, Africa, &c.

CARISTIA, or **CHARISTIA**. See the article **CHARISTIA**.

CARLINA, or **CAROLINA**, a plant, of the thistle kind, said to have been discovered by an angel to Charlemaign, to cure his army of the plague: whence its denomination.

Its root is of service as a diuretick and sudorific, in all pellenential disorders. Botanists more usually call it *Chamaeleon allus*. See *Supplement*, article **CARLINA**.

CARLINGS, or **CARLINES**, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; serving as a foundation for the whole body of the ship.

On

On these the ledges rest, whereon the planks of the deck; and other matters of carpentry are made fast. The *Carlings* have their ends let into the beams called *Culver-tail-ways*.—See *Tab. Ship*, Fig. 2. n. 29. 37. 60. and 92.

CARLING Knees, are timbers going athwart the ship, from the sides to the hatch-way, serving to sustain the deck on both sides.

CARMELITES, an order of religious, making one of the four tribes of mendicants, or begging friars; and taking both the name, and origin from *Carmel*, a mountain of Syria, formerly inhabited by the prophets Elias and Elisha, and by the children of the prophets; from whom this order pretends to descend in an uninterrupted succession.

The manner in which they make out their antiquity, has something in it too ridiculous to be rehearsed. Some among them pretend they are descendants of J. C. Others go further, and make Pythagoras a *Carmelite*, and the ancient Druids regular branches of their order.

Phocas, a Greek monk, speaks the most reasonably; he says, that in his time, viz. in 1185, Elias's cave was still extant on the mountain; near which were the remains of a building, which intimated there had been antiently a monastery; that some years before, an old monk, a priest of Calabria, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers. In 1209, Albert, patriarch of Jerusalem, gave the solitaries a rigid rule; which Papebroch has since printed. In 1217, or, according to others, 1226, pope Honorius III. approved and confirmed it; though it was afterwards mitigated by Innocent IV. S. Louis brought some of these *Carmelites* with him from the Holy Land into France. Many of the popes give them the title of *Brothers of the blessed Virgin*.

This order is eminent for the devotion of the scapulary, for its missions, and for the great number of saints it has stocked the Romish church withal. In the last century, there were four canonizations in this order, viz. of St. Theresá, S. Andrew Corin, S. Mag. de Pazzi, and S. J. de la Croix.

The order of the *Carmelites* is divided into two branches, viz. *Carmelites of the antient observance*, called the *mitigated*, or *moderate*; and those of the *strict observance*, called *Bare-footed Carmelites*.

The *antient observance* has only one general, under whom are forty provinces; and the congregation of Mantua, which has a vicar-general.

The *strict observance* has two generals; one in Spain, having six provinces under his command; and another in Italy, with twelve in several parts of Europe.

Bare-footed CARMELITES, are a reform of the antient *Carmelites*, set on foot in 1540, by S. Theresá; so called from their going bare-footed.

She began with the convents of nuns, whom she restored to the primitive austerity of the order, which had been mitigated by Innocent IV. in 1245; and at length carried the same reform among the friars. Pius the V. approved the design, and Gregory III. confirmed the reform in 1580.

There are two congregations of bare-footed *Carmelites*, which have each their general, and their several constitutions: the one the *Congregation of Spain*, divided into six provinces; the other called the *Congregation of Italy*, comprehending all the rest, not depending on Spain.

Knights of Mount CARMEL, are a military order of knights hospitaliers, instituted in 1607, by Henry IV. of France, under the title, habit, and rule of our lady of mount *Carmel*; and in consequence of a bull of pope Paul V. in 1608, united to the order of St. Lazarus of Jerusalem, with all its commendaries, priories, and other goods for its endowment.

The founder proposed it to consist of one hundred French gentlemen, who should be obliged, in times of war, to march close to the kings of France, as their guard.

Authors are much divided, whether to call this a new institution, or a reformation of that of S. Lazarus; though it is generally carried for the former. See *LAZARUS*.

CARMEN*, an antient term among the Latins, used, in a general sense, to signify a verse; but in a more peculiar sense to signify a spell, charm, form of expiation, execration, &c. couched in a few words, placed in a mystic order, on which its efficacy depended.

* Pexron derives *Carmen*, from the Celtic *Carm*, the shout of joy, or the verses which the antient bards sung, to encourage the soldiers before the combat; adding that the Greek *χαῖμα*, signifies combat and joy: which is true; but then it is not does come from the Celtic *Carm*, but from *χαίρω*, I rejoice.

Some fetch the origin of the poetical *Carmina*, or verses, hence; and say, they took that name from their resemblance to these spells: others, on the contrary, say, that the spells had their origin from the poetical verses, and took their name from their resemblance thereto: it is at least certain, that many of the antient charms wherewith diseases were supposed to be cured, were metrical verses, to which, in those ages, greater efficacy was ascribed than to mere words or prose.

VOL. I.

Vigeneré, again, derives *Carmen* from *Carmēta*, because that prophets couched her predictions in verses, or short periods; but others say, the prophets took the name *Carmēta* from *Carmen*, on the same account.

CARMENTALIA, a feast among the old Romans, celebrated annually on the 11th of January, in honour of *Carmēta*, or *Carmētia*, a prophetess of Arcadia, mother of Evander, with whom she came into Italy sixty years before the Trojan war.

The solemnity was also repeated on the 15th of January, which is marked in the old calendar by *Carmentalia Relata*.

This feast was established on occasion of a great fecundity among the Roman dames, after a general reconciliation with their husbands, with whom they had been at variance, in regard of the use of coaches being prohibited them by an edict of the senate.

It was the women who celebrated this feast: he who offered the sacrifices, was called *Sacerdos Carmentalis*.

Authors are divided about the origin of the word *Carmēta*: *Vigeneré* says, the prophetess was so called *quasi carnis mentes*, out of her senses, or out of her self; by reason of the enthusiasm she frequently fell into. Others say, she took her name from *carmen*, verse; because her prophecies were couched in verses: but *Vigeneré*, as before noted, maintains *Carmen* to be derived from *Carmēta*.

CARMINATIVES*, in medicine, are remedies, whether simple or compound, used in colics, and other flatulent distempers, to dispel the wind. See *WIND*.

* The word comes from the Latin *Carminare*, to card, or tease wool, and figuratively to attenuate and disperse wind, or vapours, and promote their discharge by perspiration. Though Dr. Quincy makes its origin more mysterious: he says, it comes from the word *Carmen*, taking it in the sense of an invocation, or charm; and makes it to have been a general name for all medicines which operated like charms, i. e. in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately ceased upon dissection; the term *Carminative* became in a peculiar sense applied to medicines which gave relief in windy cases, as if they cured by enchantment. But this derivation appears a little too much strained.

The four *Carminative* flowers, are those of camomile, melilot, motherwort, and dill.

CARMINE, a bright red or crimson colour, bordering somewhat on purple, used by painters in miniature; and sometimes by painters in oil, though rarely, by reason of its excessive price. *Carmine* is the most valuable product of the cochineal mectique; it is a fecula or sediment, subsiding to the bottom of the water, wherein are steeped cochineal couan, and atour: some add rocou, but this gives the *Carmine* too much of the orange cast. To be good, it must be almost an impalpable powder.

Some make *Carmine* with brashie wood, fernambouc, and gold leaf, beat in a mortar, and steeped in white wine vinegar; the scum arising from this mixture, upon boiling, when dried, makes a sort of *Carmine*: but this kind is much inferior to the former.

CARNATION, *Flesh-colour*, in painting, is understood of all the parts of a picture in general which represent flesh; or those parts of human figures which are naked and without drapery. Titian and Corregio, in Italy, and Rubens and Van Dyke in Flanders, excelled in *Carnations*.

It may be here observed, that the word *Carnation* is not properly used for any particular part of the perf in painted, but for the whole nudity of the piece. See *COLOURING*.

CARNEL.—The building of ships first with their timber and beams, and after bringing on their planks, is called *Carnel-work*, to distinguish it from clench-work.

Vessels also which go with mizzen-sails instead of main-sail, are by some called *Carnels*.

CARNIVAL, or *CARNAVAL*, a season of mirth and rejoicing, observed with great solemnity by the Italians, and particularly at Venice.

* The word is formed of the Italian *Carnavale*; which Mr. Du Cange derives from *Carn a-val*, by reason the flesh then goes to pot, to make amends for the season of abstinence ensuing. Accordingly, in the corrupt Latin, he observes, it was called *Carnelovenen*, and *Carnisfraternum*; as the Spaniards still denominate it, *Carnes tellendas*.

The *Carnival* time commences from twelfth day, and holds till lent.—Feasts, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in *Carnival* time.

CARNIVOROUS, *CARNIVORUS*, an epithet applied to those animals which naturally feed, and feed on flesh.

It is a dispute among naturalists, whether or no man be naturally *Carnivorous*? some contend that the fruits of the earth were intended as his sole food, and that it was necessity in some places, and luxury in others, that first prompted them to feed upon their fellow-animals. Pythagoras and his followers looked on it as a great impiety; and strictly abstained

from all flesh, from the notion of a metempsychosis: and their successors, the Bramins continue the same to this day.

The consideration Gassendus chiefly insists on, why man should not be *Carnivorous*, is the structure and conformation of our teeth; the most of them being either incisores or molitors; not such as *Carnivorous* animals are furnished with, proper to tear flesh; except the four *Canini*: as if nature had rather prepared us for cutting herbs, roots, &c. than for eating meat.

To which may be added, that when we do feed on flesh, it is not without a preparatory coction, by boiling, roasting, &c. And even then, as Dr. Drake observes, it is the hardest of digestion of all other foods, and is prohibited in fevers, and many other distempers: and lastly, that children are rather averse to all animal foods, till their palates become vitiated by custom; and the breeding of worms in them, is generally ascribed to the too hasty eating of flesh.

To these arguments, Dr. Wallis subjoins another; which is, all quadrupeds which feed on herbs or plants, have a long colon, with a cæcum at the upper end of it, or somewhat equivalent, which conveys the food, by a long and large progress, from the stomach downwards, in order to its slower passage and longer stay in the intestines; but that in *Carnivorous* animals such cæcum is wanting, and instead thereof there is a more short and slender gut, and quicker passage through the intestines.—Now, in man, the cæcum is very visible: a strong presumption that nature, who is still consistent with herself, did not intend him for a *Carnivorous* animal.—It is true, the cæcum, is but small in adults, and seems of little or no use; but in a fœtus, it is much larger in proportion: and it is probable, our customary change of diet, as we grow up, may occasion this shrinking.

CARNOSA Membrana, } in anatomy; see **PANNICULUS**
CARNOSUS Panniculus, }
Carnosus, and **MEMBRANE**.

CARNOSITY, is used by some authors for a little fleshy excrescence, tubercle, or wen, formed in the urethra, the neck of the bladder, or yard, which stops the passage of the urine.

Carnosities are very difficult of cure: they are not easily known, but by introducing a probe into the passage, which there meets with resistance. They usually arise from some venereal malady ill managed.

CARO, in anatomy, &c. See the article **FLESH**.

CARO Musculosa quadrata, in anatomy, a muscle so called by Fallopius and Spigelius, but more popularly *palmaris brevis*. See **PALMARIS**.

CAROLINE, an epithet given to the four books composed by order of Charlemaign, to refute the second council of Nice, with regard to the worship of images.

The *Caroline* books contain one hundred and twenty heads of accusation against that council, and are couched in very harsh, reproachful terms. Some authors doubt of the antiquity and genuineness of these books: they are attributed by some to Angelman, bishop of Metz; by others to Alcuin; but others, with more reason, ascribe them to the bishops of France; alledging, that pope Adrian having sent Charlemaign the acts of the council in 790, he gave them to be examined by the French bishops; and that the *Caroline* books were the answer they returned.

They were sent to the pope about the time of the council of Frankfort; and were first printed in 1549, by M. Du Tillet, bishop of Meaux, under the name of *Elia Phylira*.

CAROLUS, an ancient English broad piece of gold, struck under K. Charles I. whose image and name it bears. Its value of late has been estimated at twenty-three shillings sterling; tho' at the time when it was coined, it is said to have only been rated at twenty shillings.

CAROTIDS, *Karotides*, in anatomy, two arteries of the neck, on each side, serving to convey the blood from the aorta, to the brain.—See *Tab. Anat. (angiol.)* fig. 1. n. 5. 5. 13. 13. (osteol.) fig. 5. 1. 1. 2. 3. 3. lit. xx. yy. (splanch) fig. 12. lit. p.

The right *Carotid* arises from the subclavian, just where that springs out of the porta; but the left immediately out of the aorta. They both lie pretty deep, and being defended by the *aspera arteria*, pass free from any compresure, and without sending out almost any branches, straight to the cranium. Just before their arrival there, they send forth the external *Carotid*; and passing the os petrosum, proceed on with some circumvolutions, till laying aside their muscular membrane, and giving branches to the dura mater, they pass along the cranium, defended by the sides of the sella turcica, and dura mater: and sending branches to the outer parts of the pia mater, and the nerves, they at last reach the cerebrum; where dividing into infinite ramifications, they are lost in the cortical part; or perhaps proceed even into the medullary part thereof.

Hippocrates and the ancients placed the seat of drowiness in these arteries, whence they had the name *Carotids*, *q. d. soporariæ*, from *καρως*, drowiness.—for the same reason they were also called *Lethargicæ* and *Apoplectica*.

CARP-Fishing. See the article **Carp-FISHING**.

CARPEA, from *Καρπια*, a kind of dance, or military exercise in use among the Athenians and Magnesians, performed by two persons; the one acting a labourer, the other a robber.

The labourer, laying by his arms, goes to sowing and ploughing; still looking warily about him, as if afraid of being surprized: the robber at length appears, and the labourer quitting his plough, betakes himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes, and in cadence.

Sometimes the robber was overcome, and sometimes the labourer; the victor's reward being the oxen and plough.

The design of the exercise, was to teach and accustom the peasants, to defend themselves against the attacks of ruffians.

CARPENTERS-Work, in a building, includes the framing, flooring, roofing; the foundation, carcase, doors, windows, &c.

CARPENTER'S Joint-rule. See the article **RULE**.

CARPENTRY, * the art of cutting, framing, and joining large pieces of wood, for the uses of building. See **BUILDING**.

* The word is derived from the Latin *Carpentum*, a Car, or Cart.

Carpentry is one of the arts subservient to architecture, and is divided into two branches, *House Carpentry*, and *Ship Carpentry*; the first employed in railing, framing, roofing, flooring, &c. of houses, &c.

The second is the construction of vessels for sea; as ships, barks, barges, boats, &c.

The rules and practices in *Carpentry*, as to planing, sawing, mortising, tenancing, scribing, paring, moulding, &c. are much the same as those in joinery: so likewise are the tools, or instruments, and the stuff is the same in both; all the difference between the two arts consisting in this, that joinery is used in the smaller and more curious works. And *Carpentry* in the larger, stronger, and coarser.

Fr. Pyrrard assures us, that the art of *Carpentry* is in its greatest perfection in the Maldives islands: their works, there, he observes, are so artfully managed, that they will hold tight and firm without either nails or pins. He adds, they are so curiously put together, that no body can take them asunder, but those acquainted with the mystery.

CARPET, a sort of covering, worked either with the needle, or on a loom; to be spread on a table, trunk, an estrade, or even a passage, or floor.

Persian and Turkey *Carpets* are those most prized; especially the former: *Carpets* that had a hair or flag on one side only, were called by the ancients *Tapetes*; such as had a flag on both sides, were called *Amphitapetes*.

Among jockeys, to *have the Carpet*, is to gallop very close, or near the ground; a fault foreigners charge on English Horses. See **GALLOP**.

Figuratively, an affair, proposal, &c. are said to be brought on the *Carpet*, when they are under consideration, &c.

CARPOBALSAM, or **CARPOBALSAMUM**, * the fruit of the tree which yields the true oriental balm, or balsam; very much resembling, both in figure, size, and colour, that of turpentine.

* The word comes from the Greek *Καρπος*, fruit, and *Βαλσαμ*, balsam.

The *Carpobalsamum* is an oblong fruit with a short footstalk, a brown wrinkled rind, marked with four ribs; of a grateful taste and smell.

It is seldom found in shops; some substituting Jamaica pepper, and others cubens in its place.

CARPOCRATIANS, a branch of the ancient gnosticks, so called from *Carpocrates*, who in the second century revived, and improved upon the errors of Simon Magus, Menander, Saturninus, and other gnosticks.

He owned, with them, one sole principle and father of all things, whose name, as well as nature, was unknown. The world, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts, which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations; making that a necessary condition of perfection. See **Gnostics**.

CARPUS, *καρπος*, in anatomy, the wrist; or that part between the palm of the hand, and the arm.—See *Tab. Anat. (osteol.)* fig. n. 9. and 7. v. 12.

The *Carpus*, called also *Brachiale*, consists, according to some, of seven, according to others, of eight bones of different figures and bulks, placed in two ranks, four in each: the first rank is articulated with the two foci; the second with the bones of the metacarpus. They are strongly tied together by the ligaments which come from the radius, and by the annular ligament thro' which the tendons which move the fingers pass: although this ligament be thought but one, yet it gives a particular case to every tendon which passes through it.

The Arabians call it *Rafeta*; the Latins sometimes *Carpinus*.

CARRAT, **CARAT**, or **CARACT**. See the article **CARRAT**.

CARR,

CARR

CARR*, **CARRUS**, a kind of rolling throne, used in triumphs, and at the splendid entries of princes.

* The word is from the ancient Gaulish, or Celtic, *Carr* mentioned by Cæsar, in his commentaries, under the name *Carrus*.

Plutarch relates, that Camillus having entered Rome in triumph, mounted on a *Carr* drawn by four white horses, it was looked on as too haughty an innovation. See **TRIUMPH**.

CARR, is also used for a kind of light, open chariot. Pontanus observes, that Erichonius was the first that harnessed horses, and joined them in a *Carr*, or chariot.

The *Carr*, on medals, drawn either by horses, lions, or elephants, usually signifies, either a triumph, or an apotheosis: sometimes a procession of the images of the gods, at a solemn supplication; and sometimes of those of some illustrious family at a funeral.—The *Carr* covered, and drawn by mules, only signifies a *Conferation*, and the honour done any one of having his image carried at the games of the Circus.

The *Carr* used by the ladies, was called *Pileatam*, *Carpentum*, and *Baserna*.

CARRIAGE, a vehicle for the conveyance of persons, goods, &c. from place to place.

CARRIAGE of a *Cannon*, is the frame, or timber-work whereon it is mounted; serving to point and direct it for shooting, and to convey it from place to place.

The **CARRIAGE** of a *field-piece*, consists of two wheels, which carry long and strong wooden beams, or cheeks, between which the cannon is as it were framed, moving on its trunnions as on a center: When it is required to move them, they add a vantage-train, composed of two smaller wheels.

The ordinary proportion, is for the *Carrriage* to have $1\frac{1}{2}$ of the length of the gun; the wheels to be half the length of the piece in height: four times the diameter, or caliber, gives the depth of the planks at the fore end; in the middle $3\frac{1}{2}$.

The **CARRIAGE** of a *Ship gun*, consists of two wheels, without spokes.

CARRIAGE, in agriculture, denotes a sort of furrow, cut for the conveyance of water, to overflow, or improve the ground.

CARRIERE, see the article **CAREER**.

CARROUSAL*, or **CARROWSAL**, properly a course, or contest of chariots and horses: or a magnificent entertainment, on occasion of some public rejoicing: consisting in a cavalcade of several persons, richly dressed, and equipped after the manner of the ancient cavaliers, divided into squadrons, meeting in some public place, and practicing jousts, tournaments, and other noble exercises. The word is since become of more general use, and given to any merry meetings.

* The word comes from the Italian *Carosello*, a diminutive of *Carro*, chariot. Tertullian ascribes the invention of *Carroufals*; to Ciceret and will have them militated in honour of the sun, his father: whence some derive the word from *Carrus*, or *Carrus Solis*.

The Moors introduced cyphers, liveries, and other ornaments of their arms, with trappings, &c. for their horses. The Goths added crests, plumes, &c.

CARR-TAKERS, are officers of the king's household, who, when the court travels, have charge to provide waggons, carts, &c. to transport the king's furniture and baggage.

CARTE BLANCHE, a French term, seldom used but in this phrase, To give, or send any one the *Carte blanche*; i. e. to send him a blank paper, signed, for him to fill up with what conditions he pleases.

CARTEL, a letter of defiance, or a challenge to single combat; much in use when those combats were practised, for the deciding of difficult, and not otherwise to be determined, controversies at law. See **DUEL**.

CARTESIAN Philosophy, or **CATESIANISM**, the system of philosophy advanced by Des Cartes, and maintained by his followers, the *Cartesians*.

The *Cartesian Philosophy* is founded on two great principles, the one metaphysical, the other physical. The metaphysical principle is this, *I think, therefore I am*. This principle has been attacked and defended, with a world of spirit, and a world of zeal and partiality on both sides: for, though it be true, that we are as sure by an inward perception or consciousness that we exist, as that we think; yet it is true, too, that the conclusion of this reasoning *I am*, is drawn from the antecedent *I think*: since to think, supposes to be, or exist; and the mind sees clearly the necessary connection between thinking and being.

But this principle Des Cartes should not have proposed as a new discovery: the world knew ere he taught it, that in order to think, it is required to be; and that he who actually thinks, actually exists.

The physical principle of *Cartesianism* is this, that *nothing exists but substances*: which appears a dangerous principle to the divines; and is accordingly controverted every day in the schools of the catholics; who undertake to prove, that there are absolute accidents.

CARR

Substance he makes of two kinds; the one a substance that thinks; the other, a substance extended. Actual thought, therefore, and actual extension, are the essence of substance: so that the thinking substance cannot be without some actual thought; nor can any thing be retrenched from the extension of a thing, without taking away so much of its substance.

The first article of this is refuted by Mr. Locke, who shews, that thinking is not essential to the soul, or that its essence does not consist in thought; but that there are various occasions wherein it does not think at all. The latter is stiffly opposed by the Jesuits, &c. as inconsistent with the doctrine of transubstantiation; but is much better confuted by the modern writers, from the principle of the Newtonian philosophy.

The essence of matter being thus fixed in extension, Des Cartes naturally concludes there is no vacuum, nor any possibility thereof in nature; but that the world is absolutely full: for mere space is precluded, by his principle: in regard, extension being implied in the idea of space, matter is so too. If there were any such thing as a vacuum, says he, it might be measured: the vacuum, therefore, is extended, and of consequence is matter; every thing extended being matter.

These principles of physics once supposed, Des Cartes explains mechanically, and according to the laws of motion, how the world was formed; and whence the present appearances of nature do arise. He supposes, that God created matter of an indefinite extension; that he divided this matter into little square portions, or masses full of angles; that he impressed two motions on this matter; one, whereby each part revolved round its centre; another, whereby an assemblage, or system of them, turned round a common centre: whence arose as many different vortices, or eddies, as there were different masses of matter, thus moving round common centers.

These things thus set a-going, the consequences, according to Des Cartes, in each vortex, will be as follows: the parts of matter could not move and revolve among each other, without having their angles gradually broke; and this continual friction of parts and angles, must produce three elements: the first, an infinitely fine dust, formed of the angles broke off; the second, the spheres remaining, after all the angular irregularities are thus removed: these two make the matter of his first and second element. And those particles not yet rendered smooth and spherical, and which still retain some of their angles and hamous parts, make the third element.

Now the first, or subtlest element, according to the laws of motion, must take up the center of each system, or vortex, by reason of the smallness of its parts: and this is the matter which constitutes the sun, and the fixed stars above, and the fire below. The second element, composed of spheres, makes the atmosphere, and all the matter between the earth and the fixed stars; in such manner, as that the largest spheres are always next the circumference of the vortex, and the smallest next its center. The third element, or the hooked particles, is the matter that composes the earth, all terrestrial bodies, comets, spots in the sun, &c.

This system, though very artfully concerted, yet carries with it more of the air of a romance, than of a just philosophy. Accordingly, both divines and philosophers cry out on it: the first, that it leads to atheism, by furnishing the maintainers of an eternal matter, with means how, from the laws of motion, to account for the production of the world: though, it is certain, Des Cartes supposed a deity; and so must all who admit his philosophy; else whence will they derive that motion of matter, which of itself is destitute of any such principle?

But the philosophers have much better pleas against it; and the elements, subtle matter, hooked atoms, vortices, and other machines, are now nearly on the same footing with the occult qualities of the ancient peripatetics.

Indeed, Des Cartes, by introducing geometry into physics, and accounting for natural phenomena from the laws of mechanics, did infinite service to philosophy; and contributed, both by his practice and example, to purge it from that venerable rust, which in a long succession of ages it had contracted: accordingly, to him, in some measure, is owing the present system of mechanical, and even the Newtonian philosophy.

Cartesianism was once ready to be prohibited by an arret of the parliament of Paris; and had been so, in effect, but for a burlesque address presented to the first president.

CARTESIANS, a sect of philosophers, who hold or assert the *Cartesian* principles.

Rene des Cartes, the noble founder of this sect, was of Bretagne, born in the year 1596. His monument informs us, "That having mastered all the learning of the schools, which proved short of his expectation, he betook himself to the army, in Germany and Hungary; and there spent his vacant winter hours, in comparing the mysteries and phenomena of nature, with the laws of mathematics; daring to hope, that these might unlock the other. Quitting, therefore, all other pursuits, he retired to a little village near Egmond, in Holland; where spending twenty-five years in continual reading and meditation, he effected his design."

CAR

He was a person of great genius and penetration, both as to the invention, and orderly ranging and disposing of things. He begun a new method of philosophy, and finished it, on his own foundation. His reputation in foreign nations, appears on his monument; which consists of four faces, inscribed with so many encomiums. It was erected at Stockholm, where he died, in the year 1650, by Monsieur Chanut, the king of France's resident in that court. But his bones were afterwards removed to Paris, at the charge of M. d'Alibret, who also erected a handsome monument over them, in the church of St. Genevieve.

CARTHUSIANS, an order of religious, instituted by S. Bruno, about the year 1086; remarkable for the austerity of their rule, which obliges them to a perpetual solitude, a total abstinence from flesh, even at the peril of their lives; and absolute silence, except at certain stated times.

Their houses were usually built in deserts, their fare scarce, and their discipline severe. It is observed, that the monastical piety is still better preserved in this, than in any of the other orders. M. l'Abbe de la Trappe, however, endeavours to shew, that the *Carthusians* do not live up to the austerity enjoined by the ancient statutes of Guignes, their fifth general. M. Maffon, at present general of the order, answers the abbat; and shews that what he calls the statutes, or constitutions of Guignes, are, in reality, only customs compiled by father Guignes; and that they did not become laws till long after.

CARTILAGE, in anatomy, a smooth, solid, uniform, flexible, elastic part of an animal; softer than a bone, but harder than any other part.

Cartilages seem to be nearly of the same nature with bones, and only to differ as more or less hard. There are some very hard, and which even become bony with time; as those, e.g. which form the sternum. Others are softer, and serve to compose entire parts; as those of the nose, ears, &c. where an easy gentle motion is required; their natural elasticity serving them in the place of antagonist muscles.

There are others softer still, partaking of the nature of ligaments, and thence called *Ligamentous Cartilages*.

There are *Cartilages* of various figures, acquiring various names from the things they resemble: one is called *Annularis*, because it resembles a ring; another *Xipoides*, from its resembling the point of a dagger; a third *Scutiformis*, because made like a buckler; and so of the rest. See each under its proper head.

Cartilages have no cavities for marrow; nor any membranes, or nerves, for sensation. Their uses are to prevent the bones from being damaged or wounded by a continual friction; to join them together by a Synchronosis; and to contribute, in great measure, to the well forming of several parts; as the nose, ears, trachea, eyelids, &c.

CARTON*, or, as we pronounce it, **CARTOON**, in painting, a design, made on strong paper, to be afterwards calqued through, and transferred on the fresh plaster of a wall, to be painted in fresco. See **DESIGN**.

* The word, in the original French, signifies *thick paper*, or *past-board*.

CARTON is also used for a design coloured, for working in mosaic, tapestry, &c. The *Cartoons* preserved at Hampton-Court, are designs of Raphael Urbin; intended for tapestry. See Richardson in his Essay on Painting, where he spends a great part of a chapter on the Colouring of the *Cartoons*.

CARTOUCH*, a wooden case about three inches thick, girt round with marlin, and loaden with two, three, or four hundred musket balls, besides six or eight balls of iron of a pound weight; to be fired out of a hobit, or small sort of mortar, chiefly for the defence of a pals, or the like.

* The *Cartouch* is also called by the French *Gargouze*, *Gargouche*, or *Gargouffe*.

In cannon of calenates or other posts, which defend the passage of the ditch, or the like, *Cartouches* have a terrible effect: since bursting asunder they spread the shot they are loaden with far and wide. There are divers other forms and compositions of *Cartouches*, and some made for guns.

CARTOUCH is also used for what is more frequently called a *Cartridge*. See the article **CARTRIDGE**.

CARTOUCH*, also denotes an ornament in architecture, sculpture, &c. representing a scroll of paper; being usually in form of a table, or flat member, with wavings; whereon is some inscription, or device, ornament of armory, cypher, or the like.

* The word is French, formed from the Italian *Cartaccia*, which signifies the same.

Cartouches are sometimes drawn on paper, as in the titles of maps, &c. and are sometimes made of stone, brick, plaster, wood, &c. for buildings.

CARTRIDGE*, in the military art, the charge or load of a fire-arm, wrapped up in a thick paper, pastboard, or parchment; to be the more readily charged, or conveyed into the piece.

* *Cartridges* are the same with what the French call *Cartouches*; from which word Skinner scruples not to derive *Cartridge*.

Those of cannon and mortars, are usually in cases of pastboard, or tin, sometimes of wood, half a foot long; taking up the place

CAR

of the bullet in the piece, to whose caliber the diameter is proportioned. Those of muskets, pistols, and small arms, only contain the charge of powder, with a ball wrapped up in thick paper.

CARVING. See the article **SCULPTURE**.

CARUNCULA, **CARUNCLE**, a term in anatomy, properly signifying a little piece of flesh, being a diminutive of the Latin *Caro*, flesh.

The name *Caruncula*, is applied to several parts of the body: as,

CARUNCULÆ Cuticulares Alæ, a name which some anatomists give the nymphæ. See **NYMPHÆ**.

CARUNCULÆ Lachrymales, are two little eminences, one in each great canthus, or corner of the eye; separating the two puncta lachrymalia.

Some restrain the appellation *Lachrymalis* to the *Caruncula* in the greater, or inner canthus; calling that in the lesser canthus *Innominata*.

Bartholin, and some other anatomists, mistake the *Caruncula* for lachrymal glands; which they suppose placed on the punctum lachrymale, to prevent the continual shedding of tears. But Dionis shews the mistake, and maintains them to be no glands, but only duplicatures of the inner membrane of the eyelids. Some anatomists say, they help to keep the two puncta open, when the eyes are shut. See **EYE**.

CARUNCULÆ Myrtiformes, in anatomy, are four little *Caruncles*, or fleshy knobs, about the size of myrtle-berries, whence their name; found adjoining to, or rather in the place of the hymen, in the parts of generation in women.

Some suppose them to be largest in maids, and to grow less and less by the use of venery; but others, with more probability, make them the consequences of venery in the first copulation; deriving them from the broken membrane of the hymen, whose fragments shrunk up, they appear to be. See **HYMEN**.

CARUNCULÆ Papillares, or *Millaræ*, are little protuberances on the inside of the pelvis of the kidneys, made by the extremities of the tubes which bring the serum from the glands in the exterior parts, to the pelvis.

They were first discovered by Carpus; and thus called, from their resembling a little tear or pap. They are in form of acorns heads, and are less red than the flesh, as well as harder than the same. They are about the bigness of a pea, but larger at top than at bottom; ending, as it were, in a point, in the place where they are perforated to let the urine fall into the Pelvis. See **KIDNEYS**.

CARUS, *Kagos*, in medicine, a species of lethargic disease, consisting in a profound sleep, with a sudden deprivation of sensation, and motion, and an acute fever.

The *Carus* differs from a Coma in this, that the patient, in the latter, answers when interrogated; but not in the former; from a lethargy it is distinguished by the fever which attends it, which the lethargy is free from; and by the return of sensation, which the lethargic person finds when agitated or pricked: from a proper apoplexy, by the freedom of respiration, which is always hurt in an apoplexy; from an epilepsy, in that there is no motion or froth at the mouth in the *Carus*: from a syncope, by the pulse, which is high, and the face ruddy; whereas the pulse is low, and the face cadaverous in the syncope: from an hysterical suffocation, in that the patient hears and remembers things in the latter, not in the former. See Supplement, article **CARUS**.

CARYATIDES, or **CARIATES**, in architecture, a kind of order of columns, or pilasters, under the figures of women, dressed in long robes, serving to support entablatures.—See *Tab. Archit. fig. 38*.

The origin of the *Caryatides* is related by Vitruvius: the Greeks, he observes, having taken the city *Carya*, led away their women captives; and to perpetuate their servitude, represented them in their buildings, as charged with burdens, such as those supported by columns.

The *Caryatides*, M. le Clerc observes, are not now represented as among the antients, viz. as symbols of slavery, with hands tied before and behind; those characters being supposed injurious to the fair sex. Among us, they are represented as images of justice, prudence, temperance, &c. Their legs are always to be close to each other, and even across; their arms are laid flat to the body, or to the head, or at least as little spread as possible; that as they do the office of columns, they must have, as near as possible, the figure thereof. Sometimes their arms are cut off, for the greater delicacy; as in the hall of the Swift guards in the Louvre: but M. le Clerc does not approve such mutilations.

When insulated, they should never have any great weight to support; and their entablature and pedestal are ordinarily to be Ionic.—When they join to a wall, &c. it is advisable to put a console over them, which may appear to sustain the weight of their entablature; otherwise, as they represent women, they do not seem so proper to sustain great loads.—When they are made in form of angels, the same author would have them support the entablature, which in that case is to be Corinthian, with their hands.

The antients made the *Caryatides* frequently to support baskets, or corbels of flowers; and these they called *Caryatides*, or *Cistiferae*. See CANEPHORA.

CASCADE* a steep fall of water, from a higher into a lower place.

* The word is French, formed of the Italian *Cascata*, which signifies the fame; of *cascare* to fall; and that from the Latin *caderes*.

Cascades are either natural, as that of Tivoli, &c. or artificial, as those of Versailles, &c. and either falling with a gentle descent, as those of the Scaux; in form of a buffet, as at Trianon; or down steps, in form of a perron, as at St. Clou; or from balcon to balcon, &c.

CASCANS, or CASCANES, in fortification, are holes and cavities in form of wells, made in the Tetreplein, near a rampart; from whence a gallery, dug in like manner under ground, is conveyed, to give air to the enemies mine.

CASE (in grammar) is understood of the different inflections, or terminations of nouns; serving to express the different states, or relations they bear to each other, and to the things they represent.

There is a great diversity among grammarians, with regard to the nature and number of *Cases*: they generally find six *Cases*, even in most of the modern languages, which they call the *Nominative, Genitive, Dative, Accusative, Vocative, and Ablative*: But this seems only in compliance with their own ideas, which are formed on the Greek or Latin, and which they transfer to other languages.

The truth is, if, by *Case*, be only meant an occasional change in the termination of a noun, or name, which seems to be the just idea of *Case*, (regard being had either to the reason of the thing, or the sound of the word *Casus*, from *caderes*, to fall;) there will in this sense be just as many *Cases* as there are different terminations of nouns in the same number, i. e. in some languages more, in others less, and in others none at all.

Indeed, the generality of authors either have not any precise notion of *Cases* at all, or they wander strangely from that notion: for they always reckon five *Cases* of nouns in the Greek, and fix in the Latin: Though several of these *Cases* be frequently alike, as the *Genitive* and *Dative* singular, of the first declension of the Latin; the *Dative* and *Ablative* plural of the second, &c. the *Genitive* and *Dative* dual of the Greek, &c.

—So that the termination is not the sole criterion of the *Case*. It seems, however, much more agreeable to the principles of grammar, which only considers words materially, to make as many different *Cases*, as there are changes in the terminations of a name; which would free the English, and other modern tongues, from the embarass of *Cases*; most of them expressing the various relations, not by changes in termination, as the antients, but by the apposition of articles and prepositions. On this footing it is certainly wrong to say, v. g. that of a father, is the *genitive Case* of father; and to a father, the *dative*; for *of* and *to* are no part of the name *father*; they are no clothes or terminations, but articles, or modificatives, which shew the different relation of the word *father*. And the same may be said of the *Cases* of nouns, in the French, Italian, Spanish, Portuguese tongues, &c.

But the case is otherwise in the Greek name *πατρις*, or the Latin *patris*; which are real *Cases* of the words *πατήρ*, and *pater*, and different from those words; and somewhat like this may be said of the Hebrew, Arabic, Armenian, Polish, and German languages; which in the same number admit of changes in the terminations of words: and yet in these languages, *Cases* are pretty different from what they are in the Greek and Latin. The Hebrew names, for instance, are not properly declined by *Cases*: the relation expressed by the *genitive Case*, it is true, occasions an alteration in them; but then this alteration, instead of being in the noun governed, as in the Latin, in the Hebrews is in that which governs; as *אביר* *verbum falsitatis*; where the change is not in *אביר* *falsitas*, but in *אביר* *verbum*.

F. Galanus makes ten *Cases* in the Armenian; observing, that besides the six ordinary *Cases*, there is one which serves to express the instrument wherewith any thing is done; another for narration, to express the subject; a third to shew that one thing is in another; and a fourth to shew a relation between one thing and another.—Authors make but three *Cases* in the Arabic, as having only three terminations, *em*, *in*, and *an*. It must be observed, however, that though many of the languages have not properly any *Cases* of nouns; yet most, if not all of them, have a kind of *Cases* in their pronouns, without which it would be hard to conceive the connection, or syntax of a discourse; and which, therefore, make a necessary part of grammar. See the relations expressed by each *Case* under its proper head, *NOMINATIVE, GENITIVE, DATIVE, &c.*

CASE, in printing, a large flat oblong frame, placed alope, divided into several compartments, or little square cells; in each of which are lodged a number of types, or letters of the same kind; whence the compositor takes them out, each as he needs it, to compose, and make a page, or form.

They say, a *Case*, or rather pair of *Cases*, of Greek, of Hebrew, of Plac, &c.

CASE-HARDENING, a method of preparing iron, so as to render its outer surface hard, and capable of resisting the file, or any edged tool. It is used by file-cutters for coarse files; by gunsmiths, to harden the barrels of guns; and by others, on other occasions.

The process of *Case-hardening* is thus: they take hooft, or horns of oxen or cows, dry them in an oven, and powder them; then put an equal quantity of bay salt to this, and mingle both together with stale urine, or whitewine vinegar: some of this mixture they lay upon loam, and wrap it about the iron, putting also more loam over all. Then they lay it on the hearth of a forge to dry and harden; and when it is dry and hard, they put it into the fire, and blow till they give the lump a blood-red heat, but no greater: then it is taken out and quenched, and the *Case-hardened* iron is taken out of the *Case*.

CASEMATE, or CASEMENT, in architecture, denotes a hollow moulding, which some architects make $\frac{1}{2}$ of a circle, and others $\frac{1}{4}$. See MOULDING.

CASEMATE, or CAZEMATE, in fortification. See the article CAZEMATE.

CASERNS, or CAZERNS, in fortification, little rooms, or huts, erected between the ramparts, and the houses of fortified towns, or even on the ramparts themselves; to serve as lodgings for the soldiers of the garrison, to ease the garrison.

There are usually two beds in each *Casern*, for six soldiers to lye, who mount the guard alternately; the third part being always on duty.

CASES *Reserved*, in the Romish polity, are considerable sins, the abolition of which is reserved by the superiors to themselves, or their vicars.

There are some *Cases reserved* by the pope, and others by the bishops: in convents some are reserved by the chapter, &c. None but these, or their vicars, can absolve in such *Cases*; except at the article of death, when all reserved *Cases* are absolvable by the ordinary.

CASE-SHOT, are musket-bullets, stones, old pieces of iron, or the like, put up into *Cases*, and so forth out of great guns.

Case-shot is chiefly used at sea, to clear the enemies decks when they are full of men.

CASH, in commerce, the stock or ready money, which a merchant, or other person has in his present disposal, to negotiate; so called from the French term *Caisse*, i. e. chest, or coffer, for the keeping of money.

M. Savary shews, that the management of the *Cash* of a company, is the most considerable article; and that whereon its good or ill success chiefly depends.

CASHIER, the *Cash-keeper*; he who is charged with the receiving, and paying the debts of a society.

In the generality of foundations, the *Cashier* is called *Treasurer*.

CASING of Timber-work, is the plaistering a wooden house all over on the outside with mortar; and striking it, yet wet, by a ruler, with the corner of a trowel, or the like instrument, to make it resemble the joints of free-stone; by which means, the whole house appears, as if built thereof.

CASK,* a piece of defensive armour, wherewith to cover the head, and neck; otherwise called *Helmet*, and *Head-piece*.

* The word is French, *Casque*, formed from *Cassum*, or *Cassus*, a diminutive of *Cassus*, a helmet.

Le Gendre observes, that antiently, in France, the Gens d'Armes all wore *Casks*. The king wore a *Cask* gilt; the dukes and counts, silvered; gentlemen of extraction, wore them of polished steel; and the rest of plain iron.

The *Cask* is frequently seen on antient medals; where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most antient of all coverings of the head, as well as the most universal: Kings, emperors, and even gods themselves are figured therewith. That which covers the head of Rome, has usually two wings, like those of mercury: and that of some kings, is furnished with horns, like those of Jupiter Ammon, and sometimes barely bulls, or rams horns, to express uncommon force.

CASK, in heraldry, the same with helmet.

CASK, is also used as a common name for vessels of divers kinds; in contra-distinction from the liquor, or other matter contained therein. See VESSEL.

Thus a hoghead of spirits, &c. is said to weigh 4 C. $\frac{1}{2}$ and 22 L. *Cask* and liquor; a punchion, 6 C. $\frac{1}{2}$ and 2 L. *Cask* and liquor. See TUN, &c.

A *Cask of Sugar*, is a barrel of that commodity, containing from eight to eleven hundred weight.—A *Cask* of almonds, is about three hundred weight.

CASSATION,* in the civil law, the act of abrogating, or annulling any act or procedure. See ANNULING, &c.

* The word comes from the Latin *quassare*, to quash, or shake down.

The occasions of *Cassation* are 1st, when a decree is directly contrary to another decree; and both against the same party. 2^{dly}, When decrees are directly contrary to the express decision of statutes, or customs. 3^{dly}, When the formalities prescribed by the laws have not been observed.

CASSIA, *Kassia*, in medicine and pharmacy, a purgative fruit, brought from the east, being the produce of a tree of the same name, called in English the *pudding pipe tree*.

This is sometimes more particularly denominated *Cassia fistula*, *κασσία αμύγδα*, by way of distinction from another drug called *Cassia lignea*. See *CASSIA LIGNEA*.

There are four kinds of *Cassia*, alike in properties, and nearly in figure; being all in long black pods: but very different, if considered with regard to the trees that produce them. These are, the *Cassia of the Levant*, that of *Egypt*, that of *Brazil*, and that of the *Antilles islands*.

CASSIA of the Levant, is the fruit of a very high tree, whose bark is ash-coloured, its wood very firm, and its grain close; towards the center; its wood is of an ebony black, towards the circumference yellowish: its flowers are yellowish, and produce a fruit in form of a long pod, rounded and massive; of a reddish colour, bordering on black. When ripe, it is full of a black, sweetish pulp, divided by little woody cells: in this pulp are found little hard grains, in manner of stones, shaped like hearts, which are the seed of the tree. This *Cassia* must be chosen new, in large pods, heavy, and of a tan colour; the bark, when broke, fine and white within, full of a black soft pulp of a sweetish taste.

CASSIA of Egypt, is like that of the Levant, except that the tree is higher, and the leaves narrower; the fruit smaller, and the bark fatter.

CASSIA of Brazil, is the largest of all: some of the pods are found four or five inches in circumference. This kind is not very common in the shops.

CASSIA of the islands, is that now chiefly used; though heretofore the popular *Cassia* was the Levantine. It is sent from the Antilles; where it is produced in such abundance, that the vessels, in their home voyages, use it as ballast: whence it is, that we find it so often foul and dirty: the tree that yields it resembles a peach-tree. Its flowers, which are yellow, grow in clusters; and, as they decay, leave behind them a fruit or pod an inch thick, and a foot (sometimes two) long. The fruit, while in its growth, is green; when ripe, it becomes of a dark violet colour. 'Tis chosen in the same manner as that of the Levant.

When the pod is entire, and the pulp not yet take out, it is most properly called *Cassia fistula*, or *Cassia in the cane*. For use, the pulp is taken out, and driven through a hair sieve. The apothecaries have little of the better kind, but what is old, and boiled up with sugar to make it keep.

Cassia, when green, as also the flowers of the *Cassia* tree, are candy'd in the Levant and the islands; and have almost the same effects with the common *Cassia*, which is the basis of most of the purgative electuaries.

The *Tincture of CASSIA*, is a slight infusion of the pulp with the seed.

The *Extract of CASSIA*, is nothing but the pulp separated from the shell and the seeds; with the addition of a certain quantity of sugar to preserve it from turning sour.

CASSIA LIGNEA, or **XYLO-CASSIA**, is the bark of a tree much like that which bears the cinnamon; growing promiscuously with it in the island of Ceylon.

The two barks are gathered and dried in the same manner; in smell and taste are nearly alike; they are equally sweet, poignant and agreeable; and their colour, form, and thickness scarce differ at all. But the *Cassia* is the fatter, and more mucilaginous; and in chewing dissolves in the mouth, without leaving any thing woody behind; whereas the woody part of cinnamon still remains though ever so well chewed.—Some authors will have the tree which bears cinnamon bear the *Cassia* too; and make the only difference between them to consist in this, that the first comes from Ceylon, and the latter from the coast of Comorandel. See *CINNAMON*.

CASSIOPEIA, in astronomy, one of the constellations of the northern hemisphere, situate next to Cepheus.

In 1572, there appeared a new star in this constellation, which at first surpassed in magnitude and brightness Jupiter himself; but it diminished by degrees, and at last disappeared, at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest, Tycho Brahe, Kepler, Maurolycus, Licetus, Gramineus, &c. Beza, the landgrave of Hesse, Rosa, &c. wrote to prove it a comet, and the same which appeared to the Magi at the birth of Jesus Christ, and that it came to declare his second coming: they were answered on this subject by Tycho.

The stars in the constellation *Cassiopeia*, in Ptolemy's catalogue, are thirteen; in Tycho's twenty eight; but in the Britannic catalogue, Mr. Flamsteed makes them fifty six. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and Situations of the Stars.	Right Ascension.	Longitude.		Latitude.		Magnit.
		°	'	°	'	
North, in the top of the chair-back	5	21	6 44	56	46 0	6
South, in the top of the chair-back	7	21	28 40	56	26 16	6

	8	4 50	53	28 17	5 6	

CASSOCK,* a kind of surtout, or long upper garment, wore over the rest of the habit; particularly by the clergy, and anciently likewise by the laity.

* The word comes from the French *Casaque*, a horseman's coat; some derive that again, by corruption, from a garment of the *Cassacks*: Covarruvias, from the Hebrew *Casab*, to cover; whence the Latin *Casa*, cottage; and *Cassula*, a diminutive of *Casa*, another name of the *Cassack*. Lastly, others derive the name *Cassack*, as well as the thing, from the ancient *Caracalla*, a sort of upper garment which hung to the heels.

CASTALDUS, } See the article **GASTALDUS**.

CASTALDY, }
CASTANETS, **CASTAGNETTES**, or **CASTANETTES**, a kind of musical instrument, wherewith the Moors, Spaniards, and Bohemians, accompany their dances, farabands, and guitars. It consists of two little round pieces of wood dried, and hollowed in manner of a spoon, the concavities whereof are placed on one another, fastened to the thumb, and beat from time with the middle finger, to direct their motions and cadences. The *Castagnets* may be beat eight or nine times in the space of one measure, or second of a minute.

CASTELLAN, the name of a dignity or office in Poland. The *Castellans* are senators of the kingdom, but senators of the lower class, and, in diets, sit on low seats, behind the palatines or great senators. They are a kind of lieutenants of provinces, and command a part of a palatinate under the palatine. See **PALATINE**.

CASTING,

CASTING, in foundry, is the running of a melted metal into a mould prepared for that purpose.

CASTING of Candles, is the filling the moulds with tallow.

CASTING of Gold, Silver, or Copper in plates. See **COINING**.

CASTING of Lead on cloth, is the using a frame or mould covered with woollen-cloth and linen over it, to cast the lead into very fine sheets.

CASTING of Metals, of Letters, Bells, Figures, &c. See **FOUNDREY**.

CASTING in Sand or Earth, is the running of a metal between two frames or moulds filled with sand or earth, wherein the figure the metal is to take, has been impressed, in creux, by means of the pattern.

The goldsmiths also use the bone of the cuttle-fish, to mould and cast their lesser works of gold and silver; that bone, when dried, being reducible to a kind of a fine pumice, very susceptible of all impressions. See **CUTTLE-BONE**.

CASTING in Stucco or Plaster, is the filling with fine liquid plaster, a mould that had been taken in pieces from off a statue or other piece of sculpture, and run together again. There are two things to be observed with regard to the mould: the first, that it be well soaked with oil before the plaster be run, to prevent its sticking; the second, that each piece whereof it consists, have a pack-thread, to draw it off the more easily when the work is dry.

CASTING, in falconry, is any thing given an hawk to purge and cleanse his gorge.

Of these there are two kinds, viz. plumage, i. e. feathers; and cotton: the latter whereof is generally in pellets about the bigness of hazel-nuts, made of soft fine cotton, and conveyed into her gorge after supper. In the morning she will have cast them out; at which time they are to be observed, and from the colour and condition they are found in, the state of her body is conjectured. If they be cast out round, white, and not flaking, nor very moist, it is an indication all is well; if otherwise, particularly if black, green, slimy, or like the like, she is distempered. The casting of plumage is observed after the same manner as that of cotton.

CASTING, in joinery, &c.—Wood is said to cast or warp, when, either by its drought or moisture, or the drought or moisture of the air, or other accident, it shoots or shrinks; in prejudice to its flatness or straightness.

CASTLE, in a modern sense, is a place fortified by nature, or art, either in a city or country, to keep the people in their duty, or to resist an enemy.

A *Castle* is a fort of little *Cittadel*. See **CITTADEL**.

CASTLE, in the sea language, denotes an elevation on the deck of a vessel; or a part of the deck, fore and aft, raised above the rest.

Fore-CASTLE, *Castello di prora*, &c. See **FORE-CASTLE**.

Hind-CASTLE, *Castello di poppa*. See **POOP**.

CASTLE-WARD, or **CASTLE-GUARD**, *CASTELGARDUM*, or *Wardum Castri*, an imposition laid on such as dwell within a certain compass about any *Castle*, towards the maintenance of those who watch and ward the *Castle*.

The word is also sometimes used for the circuit itself, inhabited by such as are subject to this service.

CASTOR, in astronomy, a moiety of the constellation Gemini; called also *Apollo*. See **GEMINI**.

CASTOR, and *Pollux*, in meteorology, a fiery meteor, which at sea appears sometimes sucking to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen alone, it is more properly called *Helena*; two are denominated *Castor and Pollux*, and sometimes *Tyndarides*.

Castor and Pollux, are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is high spent. *Helena* alone portends ill, and witnesses the severest part of the storm yet behind.

CASTOREUM, or **CASTORIUM**, in pharmacy, a medicinal matter inclosed in bags or purses near the anus of the castor, or beaver; falsely taken for the testicles of that animal.

The bags in which the *Castoreum* is contained, are about the bigness of a goose-egg, and found indifferently in males and females; the liquor inclosed, serves to give the castor an appetite, being pressed out of its receptacles, on occasion, by the foot: when taken off, the matter dries and condenses, so that it may be reduced to a powder; by hanging in the chimney it soon becomes of the consistence of wax. It is oily, of a sharp, bitter taste, and a strong disagreeable smell. It is used to fortify the head and nervous parts, it raises the languishing spirits, resists poisons, and provokes the menses in women. It is used in lethargies, apoplexies, vertigo's, tremblings, suffocations of women, and on other occasions. Bartholine, and other authors, ascribe to it a wonderful property of precipitating things to the bottom of the water.

For the choice of *Castoreum*, the best is that of Russia; that of Canada is much inferior; the largest bags, and those that smell strongest, are the most esteemed, especially when heavy, and well scented. Care is to be taken that it have not been adulterated with honey or other drugs, to increase its weight, which is known by squeezing it; the sophisticated be-

ing softish, and yielding a liquid, stinking honey; and the natural, hard and heavy, of a brick smell, and full of filaments.

Castoreum is used in the composition of Venice treacle and Mithridate, besides various other hysseric and cephalick medicines. They draw an oil from it called *Oil of Castor*; and it is also used abroad while in its liquid state, to make several kinds of unguents.

The Russian way of curing *Castoreum*, is described in the *Philosophical Transactions* thus: "To prepare the matter of the beaver's stones, (the bags it should be) boil a proper quantity of water, with half a shovell full of wood-ashes, tie the bags in couples, and put them in the boiling water for half a quarter of an hour. Lay birch-bark on the fire, and smoke the bags well over it for an hour, till they be well dried; hang them up for a week or more, till perfectly dry and hard, they may then be packed up for use or exportation."

CASTOR Skin, the fur or skin of an amphibious animal called the *Castor*, or beaver, sometimes found in France, Germany, and Poland, but most abundantly in the province of Canada in North America: formerly it appears also to have been found in England. But there is no such animal known among us now. V. Ray's Synops. An. Quad. p. 213.

Its chief use is in the composition of hats, furs, &c. Besides this, in 1669, an attempt was made to employ it in other merchandizes; accordingly a manufactory was settled in the Faubourg S. Antoine near Paris, where they made cloths, flannels, stockings, &c. of *Castor*, with a mixture of wool. The manufactory flourished for a while, but soon decayed, it being found by experience that the stuffs lost their dye when wet, and that when dry again they were harsh, and stiff as felt.

The merchants distinguish three kinds of *Castor*, though all equally the skins of the same animal; these are *New Castor*, *Dry Castor*, and *Fat Castor*: *New Castor*, called also *Winter Castor*, and *Muscovite Castor*, because ordinarily referred to send into Muscovy, this is that taken in the winter-huntings. This is the best, and most esteemed for rich furs, as having lost none of its hair by moulting. *Dry Castor*, or lean *Castor*, is the result of the summer-huntings; when the beast is moulted, and has lost part of its hair; this being much inferior to the former, is little used in furs; but mostly in hats. *Fat Castor*, usually called *Old coat*, is that which has contracted a certain fat, unctuous humour, by sweat exhaled from the bodies of the savages, who have wore it for some time: this, though better than the dry, is yet only used for hats.

After the hair is cut off the skin to be used in hats, the pelt or skin itself, is used in various works, viz. for the covering of mails and trunks, in slippers, &c.

CASTRAMETATION,* the art, or act of incamping, i. e. of placing and disposing an army in camp. See **CAMP**.

* The word is more used in speaking of the incampments of the ancients, than those of the moderns. It comes from the Latin *Castrum*, camp; and *Meteri*, to measure, or lay out.

CASTRATION, in chirurgery, the operation of gelding, i. e. of cutting off the testicles, and putting a male animal out of a capacity of generation.

Castration is much in use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks *castrate* to the purpose, making a general amputation both of testicles and yard. *Castration* also obtains in Italy, where it is used with a view to preserve the voice for singing. See **EUNUCH**.

Castration is sometimes found necessary on medicinal considerations, as in mortifications and some other diseases of the testicles, especially the farocele and varicocele. Some have also used it in maniac cases.

CASTRATION is also in some sort practised on women: Athenæus mentions, that king Andramytes was the first who *castrated* women. Helychius and Suidas say Gyges did the same thing. Galen observes, that women cannot be *castrated* without danger of life, and Dalechampius, on the forementioned passage of Athenæus, holds, that it is only to be understood of simple pad-locking.

CASU consimili, a writ of entry, where a tenant by courtfeet, or for life, aliens in fee or in tail, or for another's life: it takes its name hence, that authority being given by stat. West. 2. to the clerks in chancery, to make new forms, as often as any new case should arise, not under any of the old forms; they framed this writ to the likeness of the other called *Casu provisio*.

Casu Provisio, a writ of entry, given by the statute of Gloucester, in case where a tenant in dower aliens in fee, or for term of life, or in tail: and lies for him in reversion against the alienee.

CATABAPTIST,* a person averse from baptism; particularly from that of infants.

* The word is compounded of the preposition *κατα*, which, in composition, signifies against, contrary; and *βαπτισμα*, I wash.

CATABIAZON, in astronomy, the moon's descending node called also *Dragon Tail*.

CATACAUSTIC Curves, in the higher geometry, the species of caustic curves formed by reflection. See **CAUSTIC CURVE**.

CATACHRESIS,* *καταχρησις*, a figure in rhetoric, whereby an improper word is used instead of a proper one.

* The word is formed from the Greek *καταχρησις*, *abuse*, I abuse;.

CAT

I abuse; of *κατα*, against, or contrary to; and *χραται*, I use.

The *Catachrestis* is, when for want of a word proper to express a thought, we use, or rather abuse a word that comes somewhat near it: as when we call a person who has killed his mother, master, or prince, *Parricide*; which word, in propriety, is only applicable to him who has murdered his father.

Thus, *Vir gregis ipse caper*; to build a horse, or ride on a swifch, are *Catachrestes*.

CATACLYSMUS, *Κατακλυσμῶς*, a Greek name for a deluge, or inundation of waters.

CATACOMBS,* or **CATACUMBS**, *CATACUMBÆ*, denote grotto's, or subterraneous cavities, for the burial of the dead.

* Some derive the word *Catcomb* from the places where ships are laid up, which the modern Latins and Greeks call *Cumbæ*. Others say, that *Cata* was used for *ad*, and *Catombæ* for *adumbæ*: Accordingly, Dadin says, they antiently wrote *Catambæ*. Others derive the word from the Greek *κατα*, and *κυμῶς*, a hollow, cavity, or the like.

Catombs are also denominated *Cryptæ*, and *Cameteria*.

Antiently, the word *Catcomb* was only understood of the tombs of St. Peter and St. Paul; and M. Chastelain observes, that among the more knowing of the people of Rome, the word *Catcomb* is never applied to the subterraneous burying-places hereafter to be mentioned, but only to a chapel in St. Sebastian, one of the seven fraternal churches; where the antient Roman calendars say, the body of St. Peter was deposited, under the consulate of Tullius and Bassus, in 258.

CATACOMB, is more particularly used in Italy, for a vast assemblage of subterraneous sepulchres about Rome, chiefly at about three miles from that city in the Via Appia; supposed to be the sepulchres of the martyrs; and which are visited accordingly, out of devotion; and reliques thence taken, and dispersed throughout the catholic countries; after having been first baptized by the pope, under the name of some saint.

These *Catombs*, are said by many to be caves, or cells, wherein the primitive Christians hid, and assembled themselves together; and where they interred such among them as were martyred. Each *Catcomb* is three foot broad, and eight or ten high; running in form of an alley, or gallery, and communicating with others: in many places, they extend within a league of Rome. There is no masonry or vaulting therein, but each supports it self: the two sides, which we may look on as the parietes, or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the same *Catcomb*, parallel to the alley. They were commonly clofed with large thick tiles, and sometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, though very rarely, the name of some of the deceased is found on the tile: frequently, a palm is seen, painted, or engraven; or the cypher Xp, which is commonly read *pro Christo*.

The opinion held by many protestant authors is, that the *Catombs* are heathen sepulchres, and the same with the puticuli mentioned by Festus Pompeius; maintaining, that whereas it was the practice of the antient Romans to burn their dead, the custom was, to avoid expence, to throw the bodies of their slaves to rot in holes of the ground: and that the Roman Christians, observing, at length, the great veneration paid to reliques, resolved to have a stock of their own: entering, therefore, the *Catombs*, they added what cyphers and inscriptions they pleased, and then shut them up again, to be opened on a favourable occasion. Those in the secret, add they, dying, or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former.

Mr. Monro, in the *Philosophical Transactions*, takes a medium between the two extremes. He supposes the *Catombs* to have been originally the common sepulchres of the first Romans, and dug in consequence of these two opinions, that shades hate the light; and they love to hover about the places where the bodies are laid.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phenicians, throughout the countries to which they sent colonies: the interring as we now do, in the open air, or in temples, was first introduced by the Christians. When an antient hero died, or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported intire, they fell on the expedient of burning, in order to bring home the ashes, to oblige the manes to follow; that so his country might not be destitute of the benefit of his tutelage. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the antient burying: thus *Catombs* became disused among the Romans, after they had borrowed the manner of burning from the Greeks; and now, none but slaves were laid in the ground.

CAT

Places thus prepared, might afford convenient reformatments for the primitive Christians; but could never be built by them. When the empire became christian, they were again disused; till the reading of I know not what author, who mentions them, occasioned them to be again looked into.—As to the famed cypher Xp, it is observed to have been in use among the antients, long before christianity arose. The abbot Bencini says, it was composed of the Greek letters XP, under which something mystical was comprehended; but no author gives any account what that mystery was.

CATACOSTICS, called also **CATAPHONICS**, the science of reflected sounds; or that part of acoustics which considers the properties of echoes.

CATADUPA,* a cataract, or water-fall. See **CATARACT**.

* The word comes from the Greek *καταδύπω*, of *κατα*, downwards; and *δύω*, a noise.

CATADUPI, *Καταδύπῳ*, an appellation given by the antients, to the inhabitants about the cataracts of the Nile.—See **CATARACT**.

The *Catadupi* are represented as all deaf; being made so by the continual din of the falling waters.

CATAFALCO, an Italian term, literally signifying *Scaffold*. It is chiefly used for a decoration of architecture, sculpture, and painting; raised on a timber scaffold, to shew a coffin, or tomb, in a funeral solemnity.

CATAGMATICS, medicines proper to solder, and unite broken bones; by promoting the formation of a callus.

* The word comes from the Greek *καταγμα*, fracture; formed of *κατα* against, and *αγω*, or *αγνυμαι*, I break.

The principal *Catagmatics*, are the Armenian bole, gum tragacanth, officella, Cyprus nuts, frankincense, aloes, and acacia. See **CONSOLIDATION**.

CATALECTIC,* a term in poetry.—The antients called *Catalectic Verses*, those which wanted either feet or syllables; in opposition to *Acatalectic*, which are complete verses, wanting nothing.

* The word comes from the Greek *κατα*, and *αληκω*, *defino*, I end.

CATALEPSIS, *Καταληψις*, or **CATALEPSY**, in medicine, a kind of apoplexy; or a drowsy disease, wherein the patient is taken speechless, senseless, and fixed in the same posture wherein the disease first seized him; and his eyes open, without seeing, or understanding.

This disease is very rare, nor is its cause easy to assign. Boerhaave takes the immediate cause to be an immobility of the common sensory, in the situation of the first access; whence comes an absolute stagnation of the blood in the brain, and a cessation of all the functions of the brain, as well as those depending thereon; the muscles alone remaining in their first tension; and respiration, and the pulse preserved, though generally weak.

It is usually preceded by a long intermitting fever, a melancholic dry temperature, a suppression of the menses, or hemorrhoids, great frights, and intense, continued meditation on one object.

Upon dissection, the arteries and veins of the cerebrum are found very turgid, and the blood close rammed in them: it is sometimes cured by copious hemorrhages of the nose; sternutatories, vomitives, and vesicatories, are likewise applied to good purpose.

It seldom passes into any other disease; tho' sometimes into an epilepsy, convulsions, madness, or atrophy; but it commonly ends in death.

CATALOGUE, *Καταλογῶς*, a list, or enumeration of the names of several books, men, or other things; disposed according to a certain order.

The jesuits of Antwerp have given us a *Catalogue* of the popes; which makes what they call their *Prophylæum*.

CATALOGUE of the Stars, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each.

The first who undertook to reduce the fixed stars into a *Catalogue*, was Hipparchus Rhodius, about one hundred and twenty years before Christ; in which he made use of the observations of Tyymocharis and Aristillus, for about one hundred and eighty years before him. Ptolemy retained Hipparchus's *Catalogue*; though he himself made abundance of observations, with a view to a new *Catalogue*, about the year of Christ 880. Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulugh Beigh, king of Parthia and India, made a new *Catalogue* of the fixed stars; since translated out of Persian into Latin, by Dr. Hyde. The third who made a *Catalogue* from his own observations, was Tycho Brahe; who determined the places of seven hundred and seventy-seven stars, for the year 1600: which Kepler, from other observations of Tycho, afterwards increased to the number of one thousand, in the Rudolphine tables. At the same time, William, landgrave of Hesse, with his mathematicians, Christopher Rothmannus, and Justus Byrgius, determined the places of four hundred fixed stars, by his own observations; which Hevelius prefers to those of Tycho's Riciolus,

Ricciolus, in his *Astronomia reformatæ*, determined the places of one hundred and one stars, for the year 1700, from his own observations: for the rest, he followed Tycho's *Catalogue*; altering it where he thought fit. Anno 1677, Dr. Halley, in the island of St. Helena, observed three hundred and fifty southern stars, not visible in our horizon. The same labour was repeated by F. Noel, in 1710, who published a new *Catalogue* of the same stars constructed for the year 1687. The next was J. Hevelius, who made a *Catalogue* of 1888 fixed stars: whereof nine hundred and fifty had likewise been observed by the ancients; three hundred and fifty-five by Dr. Halley; and only six hundred and three by himself.

The last, and greatest, is the *Britannick Catalogue*, compiled from the observations of the accurate Mr. Flamsteed; who for a long series of years devoted himself wholly thereto. As there was nothing wanting either in the observer, or apparatus, we may look on this as a perfect work, so far as it goes. It is pity the impression had not passed through his own hands: that now extant, was published by authority, but without the author's consent: it contains two thousand seven hundred and thirty-four stars. There was another published in 1725, pursuant to his testament.

CATAMITE, **CATAMITUS**, a *Ganymede*, or boy kept for sodomy. See **SODOMY**.

CATAPAN, or **CATIFAN**, a name the later Greeks, about the twelfth century, gave the governor of their dominions in Italy.

Ughellius, and others, say, *Catapan* was the same with *Capitaneus*; formed therefrom by metathesis, or transposition: others derive it from *κατα*, *juxta*, and *παις*, *omnis*; in which sense, *Catapan* was a governor general, or magistrate, who had the direction of all: others will have it derived from *κατα* *παις*, *emperor*, that is, next after the emperor. In which sense, *Catapan* was a second master. *Secundus Dominus*. Du Cange derives it from *κατα* *παις*, captain; which the Greeks applied to every governor, and even every man of quality.

CATAPASM *, *καταπασμα*, a dry medicine, composed of a mixture of powders to be sprinkled on the body.

* The word comes from the Greek *κατα*, in, and *πασαι*, I sprinkle.

There are *Catapasmæ* of divers kinds: some odoriferous, used in the way of perfume: others fortifying, applied to the stomach, heart, or head; and others escharotic, for eating off dead flesh.

CATAPELTA, an instrument of punishment, in use among the ancients. It consisted in a kind of press, composed of planks, between which the criminal was crushed to death.

CATAPHORA *, *καταφορα*, a kind of lethargy, or drowsy disease; the same with what is otherwise called *Coma*. See the article **COMA**.

* The word is compounded of *κατα*, or *κατω*, downwards; and *φορα*, to bear.

CATAPHRYGIANS, ancient heretics; so called, as being of the country of Phrygia.

They were orthodox in every thing, setting aside this, that they took Montanus for a prophet, and Priscilla and Maximilla for true prophetesses, to be consulted in every thing relating to religion; as supposing the holy Spirit had abandoned the church. See **MONTANISM**.

CATAPLASM *, *καταπλασμα*, popularly called *Poultice*, an external medicine, in form of a pulp; of a soft consistence, like an unguent, or cerat; composed of various liquors, parts of plants, oils, unguents, &c. according to the variety of intentions.

* The word comes from the Greek *καταπλασσω*, *illino*, I smear, or apply outwardly.

Its ordinary uses are, to alluage pain, and soften, resolve, disperse, or suppurate matter collected in the external parts of the body.

The common *Cataplasma* for these intentions, is composed of white-bread, milk, yolks of eggs, saffron and oil of roses.

CATAPULTA *, a military machine, used among the ancients, for throwing huge stones, and sometimes large darts, and javelins, twelve or fifteen foot long, on the enemy.

* The word is originally Greek, *καταπυλτης*, formed *απο* *της* *πυλης*. See **PELTA**.

The *Catapulta* is said to be the invention of the Syrians. Some authors make it the same with the *Ballista*; others different.

CATAPUTIA, a medicinal plant, commonly called the *lesser Spurge*. It purges with such a violence, both upwards and downwards, that few physicians now venture to prescribe it. See **Supplement**, article **CATAPUTIA**.

CATARACT of *Water*, a fall, or precipice, in the channel, or bed of a river; caused by rocks, or other obstacles, stopping the course of its stream: from whence the water falls with a noise and impetuosity.

* The word comes from the Greek *καταπρασσω*, *cum impetu decido*, I tumble down with violence; compounded of *κατα*, down; and *πρασσω*, *decido*, I throw down.

VOL. I.

Such are the *Cataractæ* of the Nile, the Danube, Rhine, &c. Strabo calls that a *Cataractæ*, which we call a *Gefade*; and what we call a *Cataractæ*, the ancients usually called a *Catadupa*. Herminius has an express dissertation, *De admirandis mundi Cataractis supra & subterraneis*; where he uses the word in a new sense; signifying, by *Cataractæ*, any violent motion of the elements.

CATARACT, in medicine, a suffusion of sight, arising from a little film, or pellicle, which swimming in the aqueous humour of the eye, and getting before the pupil, intercepts the rays of light.

The *Cataractæ* is supposed to be formed by a condensation of the more viscous parts of the aqueous humour, between the uvea and the crystalline: though some take it to be a pellicle, detached from the crystalline itself; which is only an assemblage of several little pellicles, laid over one another.

There are two kinds of *Cataractæ*; the *Genuine* and *Spurious*; the first owing to a humour amassed in the eye, coagulated and fixed therein, and destroying its use: the latter arising from fumes or vapours, thrown upon the eye by some accident; as in a fever, &c.—The genuine *Cataractæ* has several degrees, and several names: at first the patient sees, as it were, clouds, moats, flies, &c. diffused over the objects in view: this far the *Cataractæ* is called *Imaginary*; there being nothing yet appearing to the eye of another person. As the suffusion increases, the pupil begins to appear of a sea-green colour; sometimes like the air full of clouds; and then the *Cataractæ* is called *Water*, or *water-fall'n*, when the evil is arrived at its height, and the matter is sufficiently coagulated, the patient loses all sight; the pupil ceases to be transparent, and becomes white, or brown, or of some other colour: this last state is what we properly denominate a *Cataractæ*.

Couching of CATARACTS. For the cure of a *Cataractæ*, recourse is had to the operation of couching; which is performed by running a steel needle into the eye, through the adnata, by the edge of the cornea, on the side of the little canthus, till it arrive at the middle of the *Cataractæ*; then turning the needle round, they twist the *Cataractæ* about its point, till being thus reduced into a little compa, it is brought down beneath the pupil, and *couched*, or lodged in the bottom of the eye, and there left: thus the impediment being removed, the light gets admission.—To render the operation effectual, care must be taken, that the pellicle or *Cataractæ* be ripe, or arrived at its consistence, so as it may be easily rolled up; that its parts be not crushed, or broke in rolling up, and lodged so secure, as not to rise up again by its elasticity; and perhaps also, that it may dissolve and consume at the bottom of the eye.

This is the popular theory of *Cataractæ*, which some modern physicians and surgeons, as Heister, Brisseau, Maitre Jan, &c. oppose, and substitute a new one in its place: their opinion is, that instead of couching, or laying a little membrane, or pellicle, it is the crystalline itself that is thus couched, and lodged in the bottom of the vitreous humour. This they suppose to have been condensed, and to have lost its transparency; whence, instead of being an instrument of vision, it proves an obstacle to it, by shutting out the rays from the retina. This alteration of its transparency, they say, is accompanied with a change of colour; it sometimes becomes greenish; and on this account is called by the Greeks *Glaucoma*.—The *Glaucoma* and *Cataractæ* therefore, in their opinion, are the same thing: though in the other hypothesis they are very different; the first being reputed incurable, but not the latter.

The chief reason urged in behalf of this latter hypothesis, in the royal academy of sciences, where it was proposed, is, that after the operation of couching, the person cannot see without a convex lens.—Now if no more were done, than the taking away the pellicle from before the crystalline, it would be in the same condition as before, and would make the same refractions; nor would any lens be necessary: whereas, supposing the crystalline couched, it is evident the lens will be required to supply its place.—To which is answered, that there have been instances of persons who have seen, after couching, without any lens; at least, it is granted, that immediately after the operation, several persons have seen very distinctly: and though lens's soon become necessary, yet the first moment wherein they saw without, seems to be a proof that the crystalline was not couched.

M. de la Hire, in confirmation of the ancient system, assigns this reason for the necessity of a lens, after the operation, *viz.* that the vice which produced the *Cataractæ* is still subsisting in the aqueous humour; which being too thick and muddy, lets too few rays pass: a falling to be repaired by a lens, which throws a greater quantity of rays on the retina.—He adds some experiments made on the eyes of oxen; the result of which was, that the crystalline could never be laid perfectly in the bottom of the eye, but still stuck up in part, so as to stop up part of the passage of the rays; partly on account of its bulk, and partly on that of its being sustained by the aqueous and vitreous humour: he adds, that in the operation of couching, the needle is apt to scratch the anterior surface of the crystalline, and open the membrane wherewith it is enveloped; the consequence of which

which will be wrinkles, which will render the refractions irregular, and change the direction of the rays which should all meet in the same point; so as to spoil the representation of objects. Lastly, it is insisted, that if the crystalline be couched, the patient would not see at all, for want of the necessary refractions.

M. Antoine, on the other hand, relates, that upon opening a person whom he had couched on both eyes, he found the two crystallines actually couched, and lodged at the bottom, between the vitreous humour and the uvea, where they were left by the needle; and yet the person saw without either: which shews, both that the operation of couching the crystalline is practicable, and that vision may be performed without it. In effect, the vitreous and aqueous humour, upon removing the crystalline may be supposed to run into the cavity, to assume the figure of its mould, and to perform the refractions and offices of the crystalline; it being found, by experiment, that the refraction is the same in both humours.

To shew, however, that there are *Cataracts* distinct from Glaucomas, M. Littere produced before the society an eye of a man blind twenty-two years; wherein was a distinct *Cataract*, or pellicle, which closed the aperture of the pupil.

CATARRH,* in medicine, a preternatural distillation, or defluxion of a sharp, ferous humour from the glands, especially about the head and throat, upon the parts subjacent.

* The word is Greek, *καταρρῆσις*, formed from *καταρρῆσις*, *defluso*, I flow down.

Catarrras are, generally, occasioned by a diminution of insensible perspiration on taking cold; the effect whereof is, that the lymph, that should pass by the skin, oozes out upon those glands; and being thus extravasated, occasions irritations, coughs, and all the usual symptoms. See **COUGH**. Degory deduces all diseases from *Catarrras*; which he looks upon as the seminary of most disorders of the body.

Etmuller distinguishes a *hot* and a *cold Catarrrh*; the first attended with an unnatural heat and pain, and a phlogosis of the whole body; the excreted lymph being exceeding thin and sharp: in the cold kind, all the symptoms are more remiss.

There is also a *suffocative Catarrrh*, seated in the larynx, and epiglottis, which it constricts; and thus obstructing respiration, endangers strangling.

Catarrrhs are cured by softening the ferous humours, and augmenting transpiration, by means of diaphoretics, narcotic medicines, and diuretics.—Smoking of tobacco is recommended as excellent in all *catarrhal* affections: in obstinate *Catarrrhs*, recourse is sometimes had to issues and blisters.

Catarrrhs do not arise from the head only, but sometimes also from other parts of the body; the lymphatic vessels, wherein the ferocities are contained, as well as the glands that separate them, being distributed all over the body.

CATASTASIS,* in poetry, the third part of the antient Drama; being that wherein the intrigue, or action set on foot in the epitalis, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe.

* The word comes from the Greek *καταστασις*, *constitution*, this being, as it were, the mean, tenor, state, or constitution of the piece.

CATASTROPHE, in poetry, the change or revolution of a dramatic poem; or the turn which unravels the intrigue, and terminates the piece.

The *Catastrophe*, made the fourth, and last part in the antient drama; or that immediately succeeding the *catastasis*.

The *Catastrophe* is either *simple* or *implex*; whence also the fable and action are denominated.

In the first there is no change in the state of the principal persons, nor any discovery or unravelling; the plot being only a mere passage out of agitation, to quiet and repose. This *Catastrophe* is rather accommodated to the nature of the epoea, than of tragedy. Indeed we meet with it in some of the antients, but it is out of doors among the moderns.—In the second, the principal person undergoes a change of fortune; sometimes by means of a discovery, and sometimes without.

The qualifications of this change or peripetia are, that it be probable, and necessary: in order to be probable, it is required it be the natural result or effect of the foregoing actions; i. e. must spring from the subject itself, or take its rise from the incidents; and not be introduced merely to serve a turn. The discovery in the *Catastrophe*, must have the same qualifications as the *Catastrophe* itself, whereof it is a principal part: it must be both probable and necessary. To be probable, it must spring out of the subject itself; not be effected by means of marks, or tokens, rings, bracelets, or by a mere recollection, as is frequently done, both by the antients and moderns. To be necessary, it must never leave the persons it concerns in the same sentiments they had before, but always produce either love or hatred. Sometimes the change consists in the discovery; sometimes it follows at a distance; and sometimes results immediately from it, which last is the most beautiful kind: and thus it is in *Oedipus*.

Mr. Dryden thinks a *Catastrophe* resulting from a mere change in the sentiments and resolutions of a person, without any further machinery, may be so managed as to become exceedingly beautiful, may be preferable to any other.—It is a dispute among the critics, whether the *Catastrophe* should always fall out happily, and favourably on the side of virtue, or not? i. e. whether virtue is always to be rewarded, and vice punished, in the *Catastrophe*? but the reasons on the negative side seem the strongest. Aristotle prefers a shocking *Catastrophe*, to a happy one; in regard, the moving of terror and pity, which is the aim of tragedy, is better effected by the former than the latter.

Bossu divides the *Catastrophe*, at least, with regard to the epoea, into the unravelling, or *dénouement*, and the *achievement*, or finishing; the last of which he makes the result of the first, and to consist in the hero's passage out of a state of trouble and agitation, to rest and quiet. This period is but a point without extent, or duration; in which it differs from the first, which comprehends every thing after the knot, or plot laid. He adds, that there are several unravellings in the piece; in regard there are several knots, which beget one another: the finishing, is the end of the last unravelling.

CATCH-LAND, such land, particularly in Norfolk, which is not certainly known to what parish it belongs; so that the person who first gets the tithes there, enjoys it for that year, by right of preoccupation.

CATCH-POLE, or **CATCH-POLLE**, a term now used, by way of reproach, for a bailiff's follower, or assistant. See **BAILIFF**.

Antiently, it was a term of credit, applied to those we now call *Serjeants of the Mace*, *Bailiffs*, or any other that use to arrest men on any action.

CATECHU, a medicinal aromatic substance brought from the East-Indies; called also *Cachew*, and *Japan Earth*, and when prepared, ranked in the number of perfumes. See **JAPAN Earth**.

Notwithstanding the great use of *Catechu*, before that of coffee and tea, and its being still frequently used by many people, especially in France, its nature and origin was long but little known, even among the ablest physicians: some, from its being called *Japan Earth*, ranked it among the medicinal earths, and pretend it is found on the tops of mountains, covered with the roots of cedars, whose food they said it was: and that being washed in the rivers, and dried in the sun, it was formed into a kind of paste; which brought into Europe, served as the basis of several pastels, or lozenges, called *Cachew*. Others, with more probability, rank it among the gums; and maintain it to be formed of the inspissated decoction of a tree in the East-Indies, called *Cachous*; growing chiefly in the kingdom of Cochinchina. Lastly, others took it to be a facitious composition of several other drugs; especially of the juice of areca, extract of liquorice, and calamus aromaticus, and the bark of a tree called by the Indians *Catechu*. *Cachew*, or *Catechu*, is of much esteem in medicine: among other effects attributed to it, it is supposed to stop a cough, and fortify the stomach: besides its sweetening and perfuming the breath, when taken in an impalpable powder, mixed with gum tragacanth. See *Supplement*, article **CATECHU**.

CATECHUMEN,* *κατηχουμένη*, a candidate of baptism; or a person who prepares himself for the receiving thereof.

* The word comes from the Greek *κατηχουμένη*, I hear any thing spoken or delivered by word of mouth; compounded of *κατε*, and *ηχο*, I sound.

The *Catechumens* were distinguished from the *fidèles*, not only by name, but also by their place in the church: they were disposed, with the penitents, in the portico, or gallery, at the extremity of the church, opposite to the choir. They were not allowed to assist at the celebration of the eucharist; but after sermon, the deacon dismissed them with this formula proclaimed three times, *Ha Catechumeni, missa est*.

There were divers orders or degrees of *Catechumens*, in those churches and ages where the term of catechizing for two or three years was observed: but what the precise number and appellations of these orders were, is not agreed on. The Greek expositors of the antient canons usually make but two sorts, viz. the *imperfecti Catechumens*, and the *perfecti*, i. e. the beginners, or those just admitted into the class, and the proficients who were prepared for baptism.—Cave follows the same division, with this difference, that he makes the imperfect to be those who were yet reputed heathens.—Beveridge likewise makes two sorts of *Catechumens*, though he denominates them differently, viz. the *Audientes*, or hearers, who only staid in the church to hear the sermon and scriptures read; and the *Committentes*, or kneelers, called also *Substratores*, who staid to receive the minister's prayer and benediction also.—Suicer, and Bafnage, make much the same division of the *Catechumens*, viz. into *Audientes* and *Committentes*; the latter of whom were properly such as were candidates, or petitioners for baptism.—Maldonat adds to these a third class, called *Penitentes*; comprehending such *Catechumens* as were under the discipline and censures of the church.

Cardinal

Cardinal. Bona, augments the number to four kinds, *viz.* the *Audientes*, *Genusfidentes*, *Competentes*, and *Elesi*.

Bingham also distinguishes four kinds of *Catechumens*, though in a manner somewhat different from Bona's; making the *Competentes* and *Elesi*, to be but one and the same order: but advancing another order antecedent to all these, and now mentioned by any of the former writers, *viz.* *Catechumens* instructed privately and without doors, before they were allowed to enter the church.

CATEGOREMA, *Κατηγορημα*, properly denotes the name whereby a *Category*, or class of beings is represented. See *CATEGORY*.

CATEGORY *, *Κατηγορια*, in logic, a *system*, or *assemblage*, of all the beings contained under any genus, or kind; ranged in order.

* The word *Category*, was borrowed by the schools from the forum, or courts of justice: for as, in a trial, the plaintiff, or prosecutor, in accusing the criminal, or prisoner, must charge him expressly, or affirm that he did this or that, in positive terms; whence the word *Category*, *viz.* from *κατηγορεω*, to aver, or declare a charge or accusation: so in the doctrine of *Categories*, every higher may be expressly, and absolutely predicated or affirmed of every lower.

The school philosophers distribute all beings, all the objects of our thoughts or ideas, into certain genera, or classes, in order to get a more distinct and precise notion thereof; which classes the Greeks call *Categories*, and the Latins *Predicaments*. The ancients, after Aristotle, generally make ten *Categories*: under the first, all substances are comprised; and all accidents under the nine last; *viz.* quantity, quality, relation, action, passion, time, place, situation, and habit; which are usually expressed, or signified, by the following technical diction.

Arbor, fex, servus, ardore, refrigerat, nites

Ruri, eras, flabo, nec tunicatus ero.

These ten *Categories* of Aristotle, which logicians make such mysteries of, are now almost out of doors; and, in effect, are of little use: as being things purely arbitrary, without any foundation, but in the imagination of a man, who had no authority to prescribe laws for ranging the objects of other people's ideas. Accordingly, some philosophers think all nature may be better considered under these seven things, spirit, matter, quantity, substance, figure, motion, and rest: and others make but two *Categories*, substance and accident.

CATENA, in anatomy, a muscle, otherwise called *Tibialis anticus*. See *TIBIALIS*.

CATENARIA, in the higher geometry, a curve line, which a chain, or rope forms itself into, by its own weight, when hung freely, between two points of suspension, whether those points be horizontal or not.

To conceive the general nature or character of this curve, suppose a line heavy and flexible, (see *Tab. Geom. fig. 25*.) the two extremes of which, F and D, are firmly fixed in those points; by its weight it is bent into a certain curve FAD, which is called the *Catenaria*.

Let BD and *b d* be parallel to the horizon, AB perpendicular to BD, and D δ parallel to AB; and the points B δ infinitely near to each other. From the laws of mechanics, any three powers in equilibrio, are to one another, as the lines parallel to the lines of their direction, (or inclined in any given angle) and terminated by their mutual concourses: hence, if D δ express the absolute gravity of the particle D δ , (as it will, if we allow the chain to be every way uniform) then D δ will express that part of the gravity, that acts perpendicularly upon D δ ; and by the means of which, this particle endeavours to reduce itself to a vertical position: so that if this lineola d δ be constant, the perpendicular action of gravity upon the parts of the chain will be constant too; and may therefore be expressed by any given right line *a*.

Farther, the lineola D δ , will express the force which acts against that conatus of the particle D δ (by which it endeavours to restore itself into a position perpendicular to the horizon) and hinders it from doing so. This force proceeds from the ponderous line DA, drawing according to the direction D δ ; and is, *ceteris paribus*, proportional to the line DA, which is the cause of it. Supposing the curve FAD, therefore, as before, whose vertex (the lowest point of the *Catenaria*) is A, axis AB, ordinate BD; fluxion of the axis δ = B δ ; fluxion of the ordinate d δ ; the relation of these two fluxions is thus, *viz.* d δ : D δ :: *a* : DA curve; which is the fundamental property of the curve, and may be thus expressed (putting AB = *x*, and BD

$$= y, \text{ and } AD = c) ; \frac{a \cdot x}{c}$$

CATERER. See the article *POURVEYOR*.

CATHARI. See *ALBIGENSES*.

CATHARETICKS *, or *CATHARETIC Medicines*, are such as serve to consume, and eat off fungous, or proud flesh growing in wounds, ulcers, and the like.

* The word is Greek, *καθαρηκος*, formed from *καθαρο*, sometimes used for *depositor*, or *consumo*, *absumo*, I eat, consume, &c. of *κατα*, and *αγω*, I take away.

Catharetics, are otherwise denominated *Sarcophagous Medicines*. q. d. flesh-eaters. See *SARCOPHAGUS*, &c.

Such as red precipitate, burnt alum, red istum, blue Vitriol, &c.

CATHARINE, *Knights of St. CATHARINE of M. Sinai*, an ancient military order, erected for the assistance and protection of pilgrims going to pay their devotions to the body of St. *Catharine*, a virgin of Alexandria, distinguished for her learning, and said to have suffered martyrdom under Maximine.

The body of the martyr having been discovered on mount Sinai, caused a great concourse of pilgrims; and travelling being very dangerous by reason of the Arabs; an order of knighthood was erected in 1063, on the model of that of the holy sepulchre, and under the patronage of St. *Catharine*: the knights of which obliged themselves by oath to guard the body of the faint, keep the roads secure, observe the rule of St. Basil, and obey their grand master. Their habit was white, and on it were represented the instruments of martyrdom whereby the faint had suffered, *viz.* a half-wheel armed with spikes, and traversed with a sword stained with blood.

CATHARTICS, or *CATHARTIC Medicines*, are remedies which promote evacuation by stool.

Cathartics are the same with what we otherwise denominate *Purgatives*.

Cathartics are of three principal kinds, mild, moderate, and violent: the first purge gently, as Cassia, Manna, Tamarinds, Rhubarb, Sena, &c. the second pretty briskly, as Jallop, Scammony, &c. the third severely, as Colocynth, Hellebore, Laureola, &c. See each under its proper article.

Cathartics are likewise divided by some into Cholagogues, Phlegmagogues, Melanagogues, and Hydragogues; the first supposed to purge bile, the second puita, the third melancholy, and the fourth serosities.

For the theory of *Cathartics*, and the manner wherein they operate, see *PURGATIVES*.

CATHEDRAL *, a church wherein is a bishop's see, or seat.

* The word comes from the Greek *καθεδρα*, chair, of *καθίζω*, *sedeo*, I sit

The denomination *Cathedral* seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive christians: in these, the council, i. e. the elders and priests, was called *Presbyterium*; at their head was the bishop, who held the place of chairman, *Cathedrals* or *Cathedraticus*; and the presbyters, who sat on either side, were also called by the ancient fathers, *Assessores Episcoporum*. The episcopal authority did not reside in the bishop alone, but in all the presbyters, whereof the bishop was president.

A *Cathedral* therefore, originally, was different from what it is now; the christians, till the time of Constantine, having no liberty to build any temple; by their churches they only meant their assemblies; and by *Cathedrals*, nothing more than consistories.—Whence appears the vanity of some authors, especially the Spaniards, who pretend their *Cathedrals* to have been built in the times of the apostles.

CATHERETIC. See the article *CATHERETIC*.

CATHERINE. See the article *CATHARINE*.

CATHETER *, *Καθετηρ*, among chirurgeons, a hollow probe, or instrument, usually of silver, somewhat crooked; to thrust up the yard, into the bladder; in order to assist in making urine, when the passage is stopped by the stone, gravel, caruncles, &c.

* The word is formed from *καθιμεναι*, *immitto*, in regard this instrument is used to be impelled into the bladder.

CATHETUS, in geometry, a perpendicular; or a line, or radius, falling perpendicularly on another line, or surface.

Thus, the *Catheti* of a *rectangled triangle*, are the two sides that include the right angle.

CATHETUS of Incidence, in catoptrics, is a right line drawn from a radiant point, perpendicular to the reflecting line, or the plane of the speculum, or mirror.

CATHETUS of Reflection, or of the *Eye*, a right line drawn from the eye, or from any point of a reflected ray, perpendicular to the plane of reflection, or of the speculum. See *REFLECTION*.

CATHETUS, in architecture, is a perpendicular line, supposed to pass through the middle of a cylindrical body, as a column.—See *Tab. Archit. fig. 41. lit. a*.

CATHOLICK, *Καθολικος*, denotes a thing that is universal, or general.

Theodosius the great, first introduced the term *Catholick* into the church; appointing by an edict, that the title should be applied, by way of pre-eminence, to those churches who adhered to the council of Nice, in exclusion of the Arians, &c.—*Catholicism*, however, soon changed hands; for under the emperor Constantius, Arianism became so predominant, that the Arians were called the *Catholicks*.

CATHOLICK King, is a title which has been hereditary to the king of Spain, ever since the time of Ferdinand and Isabella. Colombiere says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend, it had been bore by their predecessors, the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others say, that Philip de Valois first bore the title; which was given him

him after his death by the ecclesiasticks, on account of his favouring their interests.

In some epistles of the ancient popes, the title *Catholic* is given to the kings of France, and of Jerusalem, as well as to several patriarchs and primates.

CATHOLIC Furnace, is a little furnace, so contrived, as to be fit for all kinds of operations, which do not require an intense fire.

CATHOLICON, in pharmacy, a kind of soft purgative electuary; so called, as being supposed universal; or a purger of all humours.

Different authors give different recipes for it: that called *Catholicum Nicolai* was long in use; it consists of sixteen ingredients, the chief whereof are tamarinds, cassia, senna, and rhubarb. It was called the double Catholicon, when there was a double portion of senna and rhubarb.

The **CATHOLICON for Chylsters**, only differs from this, in that it had no rhubarb, and that honey was used in it instead of sugar. See **CLYSTER**.

CATKINS, or **CATLINGS**, in phytology, an assemblage of sum-mets, hanging down from certain trees in manner of a rope, or cat's-tail; serving as the male-blossoms, or flowers of the trees by which they are produced.

CATLIN, among surgeons, is a dismembring knife, for cutting off any corrupted part of a body.

CATOPSIS, in medicine, a disorder of the sight; more usually called *Myopia*. See **MYOPIA**.

CATOPTRICS*, the science of reflex vision; or that branch of optics, which delivers the laws of light, reflected from mirrors, or specula. See **OPTICS**. Under which head, the doctrine and laws of *Catoptrics* are laid down.

* The word comes from the Greek *κατοπτρις*, *Speculum*; of *κατα*, and *επιστημι*, *video*, I see.

CATOPTRICAL Dial, a dial which exhibits objects by reflected rays. See **REFLECTING Dial**.

CATOPTRIC Telescope, a telescope that exhibits objects by reflection. See **REFLECTING Telescope**.

CATOPTRIC Cistula, a machine, or apparatus, whereby little bodies are represented extremely large; and near ones extremely wide, and diffused through a vast space; with other agreeable phenomena: by means of mirrors, disposed by the laws of *Catoptrics*, in the concavity of a kind of chest.

Of these there are various kinds, accommodated to the various intentions of the artificer: some multiply the objects; some deform them; some magnify, &c.—The structure of one or two of them, will suffice to shew how infinite more may be made.

To make a **CATOPTRIC Cistula** to represent several different scenes of objects, when looked in at different foramina, or holes.

Provide a polygonous cistula, or chest, of the figure of the multi-lateral prism *ABCDEF*, (Plate *Optics*, Fig. 19.) and divide its cavity by diagonal planes *EB*, *FC*, *DA*, intersecting each other in the centre, into as many triangular locules, or cells, as the chest has sides. Line the diagonal planes with plain mirrors: in the lateral planes make round holes, through which the eye may peep within the locules of the chest. The holes are to be covered with plain glasses, ground within-side, but not polished, to prevent the objects in the locules from appearing too distinctly. In each locule are to be placed the different objects, whose images are to be exhibited; then covering up the top of the chest with a thin transparent membrane, or parchment, to admit the light; the machine is complete.

For, from the laws of reflection, it follows, that the images of objects, placed within the angles of mirrors, are multiplied, and appear some more remote than others; whence the objects in one locule, will appear to take up more room than is contained in the whole chest. By looking, therefore, through one hole only, the objects in one locule will be seen, but those multiplied, and diffused through a space much larger than the whole chest: thus every new hole will afford a new scene: according to the different angles the mirrors make with each other, the representations will be different; if they be at an angle greater than a right one, the images will be monstrous, &c.

The parchment that covers the machine, may be made pellucid, by washing it several times in a very clear lye, then in fair water, and bracing it tight, and exposing it to the air to dry. If it be desired to throw any colour on the objects, it may be done by colouring the parchment. Zahnus recommends verdigraese ground in vinegar, for green; decoction of Brazil wood, for red, &c. He adds, that it ought to be varnished, to make it more pellucid.

To make a **CATOPTRIC Cistula** to represent the objects within it prodigiously multiplied, and diffused through a vast space.

Make a polygonous cistula, or chest, as before, but without dividing the inner cavity into any apartments or locules; (Plate *Optics*, Fig. 19.) line the lateral planes *CBHI*, *BHLA*, *ALMF*, &c. with plane mirrors, and at the foramina, or apertures, pare off the tin and quicksilver, that the eye may see through: place any objects in the bottom *MI*, v.g. a bird in a cage, &c.

Here, the eye looking through the aperture *bi*, will see each object placed at bottom, vastly multiplied, and the images removed at equal distances from one another. Hence, were a large multangular room, in a prince's palace, lined with large mirrors, over which were plain pellucid glasses to admit the light; it is evident the effects would be very surprizing and magnificent.

CATOPTROMANCY*, *κατοπτρομαντεία*, a kind of divination, among the antients; so called, because consisting in all application of a mirror. See **MIRROR**.

* The word is formed from *κατοπτρις*, *Speculum*, and *μαντεία*, *Divinatio*.

Paulanias says, it was in use among the Achaeans, where those who were sick, and in danger of death, let down a mirror, or looking-glass, fastened by a thread, into a fountain before the temple of Ceres; then, looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death: on the contrary, if the face appeared fresh and healthy, it was a token of recovery.—Sometimes glasses were used without water, and the images of things future, they say, were represented in them.

CATROPITIF, see **AGONISTIC**.

CAVA, in anatomy, the name of a vein, the largest in the body, terminating in the right ventricle of the heart; where it opens with a large mouth, to convey to it the blood brought from all the parts of the body, by the branches of the other veins, which all terminate in the *Cava*.—See *Tab. Anat. (Splanchn)* Fig. 1. lit. o. 12. lit. ee. (Angiol.) Fig. 6. lit. b. and cc.

At its entrance into the right ventricle, it has three membranous valves, called *Tricuspidæ*, or *Trigebinae*, from their triangular figure; so accommodated, as to allow the blood's passage from the *Cava* to the heart, and to prevent its return.

The *Cava* is divided into the *ascending* and *descending* parts: the *ascending Cava*, is that which arises from the lower parts; so called, because the blood hereby conveyed to the heart, mounts, or ascends.—The *descending Cava* comes from the upper parts; and is so called, because the blood hereby brought from the head, and other parts, descends.

CAVALCADE, a formal, pompous march, or procession of horsemen, equipages, &c. by way of parade, or ceremony, as to grace a triumph, public entry, or the like.

CAVALIER, or **CAVALEER**, a horseman, or person mounted on horseback: especially if he be armed withal, and have a military appearance.

Antiently, the word was restrained to a knight, or *miles*. See **KNIGHT**. The French still use *Chevalier* in the same sense. See **CHEVALIER**.

CAVALIER, in fortification, a mount, or elevation of earth, either round, or oblong; having a platform on the top, bordered with a parapet, to cover the canon placed on it, and cut with embrasures to fire through; serving to overlook and command all around the place.

Cavaliers are raised in sieges on the bastions and curtains of ramparts, in order to fire on the eminences around, and oblige them to get farther off, as well as to scour the trenches. But the gorge of the bastion is the place where *Cavaliers* are most properly erected; those raised on the curtain being rather called *Platforms*.

CAVALIERS, or **CAVALEERS**, considered as a faction. See **TORY**.

CAVALRY*, a body of soldiers, who fight, or march on horseback.

* The word comes from the French *Cavaliere*, and that from the corrupt Latin *Callarius*, a horse; whence *Callarius*, and *Cavallarius*, in the later Latin, and *καβαλλαρίας*, in the Greek.

The *Cavalry* is usually divided into horse and dragons. The horse are either regimental, or independent troops; to which latter sort belong the horse guards, and in France, the gendarmes and musketeers who serve on horseback.—The dragons and regimental horse form what they call the *Light Cavalry*: the troopers the *Heavy Cavalry*.

When an army is ranged in order of battle, the *Cavalry* is posted on the wings.

Bodies of *Cavalry*, ranged in form of battle, are called *Squadrons*.

The Romans, in their first wars, were unacquainted with the use of *Cavalry*, and made their whole force consist in infantry; inasmuch, that even in the engagement, they made their horse dismount, and fight on foot; never resuming their horses, but to pursue the enemy the better when routed. It was the *Cavalry* of Pyrrhus, that first occasioned them to alter their sentiments; but especially that of Hannibal, which struck them with such a terror, that the invincible Roman legions durst not attack them on even ground.

CAUDA Draconis, the dragon's tail, in astronomy, the name of the moon's southern, or descending node. See **NODE**.

CAVEAR, **CAVIA**, or **KAVIA**, a kind of food, or pickle, in mighty use and repute throughout Muscovy; and lately introduced upon the English table.

The *Cavia*, or *Cavear*, is the roe, or spawn of the sturgeon, taken out, salted, and dried in the sun, or by the fire. The Italian merchants settled at Moscow, drive an incredible trade with *Cavear*; the fish being caught in prodigious quantities at the mouth of the Volga, and other rivers which empty themselves into the Caspian Sea. They cure, or prepare the roes on the spot, and thence send them in this form of *Cavear* up the Volga to Moscow, to be there distributed throughout that vast empire; where it is of wonderful service to the people, on account of the three lentils there observed with great severity.

The English import considerable quantities of this commodity from Archangel; though not so much for home consumption, as to supply the French and Italians. To be good, it should be of a reddish brown colour, and very dry. It is eat with oil and lemon; sometimes with vinegar: some eat it alone with bread; and others only as a sauce, or pickle, like anchovies.

CAVEAT, in law, a bill entered in the ecclesiastical court, to stop the proceedings of one who would prove a will to the prejudice of another. See **PROBATE**.

CAVERN, **CAVERNA**. See the article **GROTTO**.

CAVERNOSA Corpora, in anatomy, called also *Corpora nervosa*, and *spongiosa*, are two cavernous bodies, of an indeterminate length and thickness, whereof the penis is principally composed. —See *Tab. Anat.* (planch) fig. 8. lit. aa. bb. and tt.

Their internal substance is rare, and spongy; and when filled with blood and spirits, it dilates and swells: in which, the tension, or erection of the yard consists. They have two distinct beginnings from the lower side of the ossa pubis; whence they increase in bulk, till their meeting with the corpus cavernosum urethrae, where they join into one, and are retained by means of a septum composed of their outer tunics: their outer extremities are capped with the glans.

CAVERNOSUM Corpus Urethrae, a third spongy body of the penis; so called, because the urethra, or urinary passage of the penis, is inclosed by it.

Its figure, contrary to that of the two corpora cavernosa, is largest at its extremities, and least in the middle; its upper part is in the perineum, and is called its *Bulb*, from its figure. Its external membrane is thin, and divided lengthwise by a septum. The middle part of this *Corpus* is nearly cylindrical; but the passage for the urine is not along the centre, but inclines to its upper part, next the body of the penis; its lower extremity dilating itself, forms the glans.

CAVERNOSA Corpora of the Clitoris, are two nervous or spongy bodies, like those of the penis; they have their origin from the lower part of the os pubis, on each side; and uniting together, constitute the body of the clitoris, as those do that of the penis. See **CLITORIS**.

Indeed, they have no perforation analogous to that of the penis; but they have a septum, or membranous partition, running all along between them, and dividing them from the glans, to its divarication at the os pubis, where they are called *Cruna Clitoridis*.

CAVERNOSUM Corpus of the Pudendum. See **RETICULARE Corpus**. **CAVESON**,* in the mane, a kind of musroll, put on a horse's nose, which binds or locks him in, and serves in breaking, managing, and tutoring him.

* The word comes from the Spanish *Caveca*, or *Cabeça*, head.

The *Cavensons* for breaking young horses, are usually of iron, made semicircularly, of two or three pieces turning on joints; others are twisted, others flat, others hollow in the middle, and indented like saws, called *Mordants*: though these last are now banished the academies.—The rope and leathern *Cavensons*, serve for passing the horse between two pillars.

CAVETTO,* in architecture, a hollow member, or moulding, containing a quadrant of a circle, and having an effect just contrary to that of a quarter-round: it is used as an ornament in cornices.—See *Tab. Archit.* fig. 6.

* The word is Italian, and is no more than a diminutive of *Cavus*, hollow.

M. Felibien observes, that the workmen confound the *Cavetto* with a scotia, but improperly; the *Cavetto* being in effect only half a scotia: yet he himself is chargeable with the same oversight. See **SCOTIA**.

When in its natural situation, the workmen frequently call it *Gula*, or *Gutule*; and when inverted, *Gorge*.

CAVIA, or **CAVIAC**. See the article **CAVEAR**.

CAVIN, in the military art, a natural hollow fit to cover a body of troops, and hereby facilitate their approach to a place.

A *Cavin* near a place besieged is of great advantage to the besiegers; as by help hereof they can open trenches, make places of arms, keep guards of horse, and the like, without being exposed to the enemies shot.

CAUKING,* or **CALKING of a ship**, implies* the driving in oakum, or somewhat of that kind into the seams, or commissures of the planks, to prevent the ship's leaking.

* Kennet derives the word from the barbarous Latin *Calcistras*, shoing.

CAUL, in anatomy, a membrane in the abdomen, covering the greatest part of the guts; called, from its structure, *Retiaulum*, but most frequently *Omentum*. See **OMENTUM**.

CAUL, is likewise a little membrane, found on some children, encompassing the head, when born.

Drelincourt takes this *Caul* to be only a fragment of the membranes of the fœtus; which ordinarily break at the birth of the child.

Lampridius tells us, that the midwives sold this *Caul* at a good price to the advocates, and pleaders of his time; it being an opinion, that while they had this about them, they should carry with them a force of persuasion which no judge could withstand: the canons at one time forbid the use of it; because some witches and forcerers, it seems, had abused it.

CAULICOLES,* **CAULICULI**, in architecture, denote those eight lesser branches, or stalks, in the Corinthian capital, which spring out from the four greater, or principal caules, or stalks.—See *Tab. Archit.* fig. 26. lit. FF.

* The word comes from the Latin *Caulis*, the stalk, or stem of a plant.

The volutes of this order, are sustained by four caules, or primary branches of leaves; from which arise these *Caulicoles*, or lesser foliages.

Some authors confound the *Caulicoles* with the volutes themselves; some with the helices in the middle, and some with the principal stalks whence they arise.

CAULIFEROUS Herbs, are such as have a true *Caulis*, stalk, or trunk, which a great many have not; as the capillaries, &c.

CAUSALITY, in metaphysics, the power, or action of a cause in producing its effect. See **CAUSE**.

It is a dispute, among the school philosophers, whether, and how the *Causality* is distinguished from the cause and effect? Some hold it a mode, or modal entity, superadded to the cause, &c. others contend for its being the cause itself, only considered *principiative* and *terminative*, &c.

CAUSE, **CAUSA**, that which contributes to the production of an effect; or that by virtue whereof a thing is done, or from which it proceeds.—In which sense, *Cause* stands essentially related to effect.

First Cause, is that which acts of itself, and from its own proper power, or virtue;—in this sense, God is the only *First Cause*.

Second Causes, are those which derive the power, and faculty of acting, from a first *Cause*.—Such *Causes* do not properly act at all; but are acted on: and therefore are improperly called *Causes*: of which kind are all those that we call *Natural Causes*.

F. Malebranche denies second, or natural *Causes*, to have any force, power, or efficacy to produce any effect; and thinks the notion in itself inconceivable. 'Tis certain the philosophers are strangely puzzled, and divided about the manner of their agency: some maintain them to act by their matter, figure, and motion; others by a substantial form; many by accidents, or qualities; some by matter and form; and others by certain faculties different from all these.

Some maintain, that the substantial form produces forms; and the accidental, accidents; others, that forms produce other forms and accidents; others, lastly, that accidents alone are capable of producing accidents, and even forms.—Again, those, for instance, who say that accidents may produce forms, by the virtue they have received from the form to which they are joined, do not all mean the same thing: some will have it, that these accidents are only the force or virtue of the substantial form; others, that they receive the influence of the form, and only act by virtue thereof: others, lastly, that they are only instrumental *Causes*.

Again, the philosophers are divided as to the action whereby *Second Causes* produce their effects: some maintain, that the causality cannot be produced, since it is that which produces; others will have them to act truly by their action; but they are still at a loss about that action.

Such variety is there in the sentiments even of modern philosophers; and those too our neighbours: nor are the antients, and those at a distance from us, better agreed: Avicenna, v. g. does not allow that corporeal substances can produce any thing but accidents. His system, according to Ruvio, is this: God produces, immediately, a most perfect spiritual substance; this produces another less perfect; that a third: and thus to the last; which last produces all the corporeal substances; and those corporeal substances accidents. But Avicenna, not being able to conceive how corporeal substances, which cannot penetrate one another, should be capable of altering one another, will have it, that only spirits are capable of acting on bodies; because nothing else can penetrate them.

CAUSES, in the school of philosophy, are distinguished into, *Efficient Causes*, which are the agents that produce any thing,

CAU

Material CAUSES, the subjects whereon the agent works, or whereof the thing is formed: thus, marble is the matter or *Material Cause* of the statue.

And **Final CAUSES**, are the motives which induce a man to act; or the end for which the thing is done: thus, victory and peace are the *Final Causes* of war.

Some add the **Exemplary CAUSE**, which is the model the agent forms, or proposes, and by which he conducts himself in the action: but this is not properly any *Cause* at all.

Formal CAUSE, the change resulting from the action; or that which determines a thing to be this, and distinguishes it from every thing else: thus, the soul is held the form, or *Formal Cause* of man, &c.

CAUSES, again, are distinguished into *Physical* or *Natural*, and *Moral*.

A **Physical Cause**, is that which produces a sensible corporeal effect: thus, the sun is the *Physical Cause* of heat.

A **Moral CAUSE**, is that which produces a real effect, but in things immaterial: thus, repentance is the *Cause* of forgiveness.

Others define a **Physical Cause** to be that which produces its effect by a physical virtue; and a **Moral Cause**, that which determines the *Physical Cause*, though not necessarily, to produce the effect: in which sense, it is also called a *Dispositive, Excitative, and Impulsive Cause*.

Thus, the sun is the *Physical Cause* of light; a stone that breaks the skull, is a *Physical Cause* of death: and thus the advice, intreaty, commands, or menaces which determine us, though not necessarily, to do, or not to do any thing, are *Moral Causes*.

In this sense, a *Moral Cause* is only applicable to a free intelligent agent: and it is this notion of a *Moral* and *Physical Cause*, that is the most just, clear, and distinct.

CAUSES, again, are considered, either as *Universal*, or *Particular*; *Principal*, or *Instrumental*; *Total*, or *Partial*; *Univocal*, *Equivocal*, &c.

An **Equivocal CAUSE**, is that which is of a different kind and denomination from its effect: thus it is the sun is said to be the *Cause* of the animals it produces.

An **Instrumental CAUSE**, is that used by the principal to produce its effect; or which is excited to produce an effect, beyond the measure of its own perfection.

A **Partial CAUSE**, that which concurs with some other in producing the effect.

A **Particular CAUSE**, is that which can only produce a single effect, or a certain kind of effects.

A **Principal CAUSE**, is that which gives motion to the instrument, or which does not operate beyond its own natural efficacy.

A **Total CAUSE**, is that which produces the whole effect.

An **Univocal CAUSE**, is that which is of the same kind and denomination with its effect: as a man the *Cause* of a man.

An **Universal CAUSE**, is that which by the extent of its power may produce all effects.

The Cartesians resolve all physical *Causes* into occasional ones.

Occasional CAUSES, are only the *Occasions*, not the direct *Causes* of their effects. See **OCCASION**.

The soul, say those philosophers, is not able to act on the body; nor the body reciprocally on the soul: to keep up an intercourse between them, God, on occasion of a motion of the body, impresses a sensation on the soul; and, on occasion of a sentiment of the soul, impresses a motion on the body. The motions, therefore, of the soul and body, are only *Occasional Causes* of what passes in the one or the other: thus, say they, the stroke or percussion, is only the *Occasional Cause* of the motion produced in the body struck: it is God is the direct efficient *Cause*. And thus the action of objects on our organs, is not the efficient *Cause* of our ideas and perceptions, but merely the *Occasional Cause*, which determines God to act on the mind, according to the laws of the union of soul and body. But the consequences that follow from this fine reasoning are very unlucky, not to say ridiculous: thus, it is not the cannon-ball that kills the man, or beats down the wall, but it is God that does it: the motion of the cannoner, whose arm, moved by the power of God, applied fire to the powder, determined God to inflame that powder; the powder inflamed, determined God to drive out the ball; and the ball driven, with an inconceivable rapidity, to the exterior surface of the body of a man, or a wall, determines God to break the bones of the man, or beat down the wall, &c. A coward, who runs away, does not run away at all; but the motion of his pineal gland, agitated by the impression of a squadron of enemies coming on him, with bayonets at the ends of their muskets, determines God to move the coward's legs, and carry him from them.

It has been often said, in a moral sense, that the world is a comedy, and that each man only acts his part; but it may be here said, in a strict physical one, that the universe is a puppet-show, and each man a punchinello, making a great deal of noise without speaking, and bustling without moving.

CAUSEWAY,* or **CAUSEY**, a massive construction of stone, stakes, and fascines; or an elevation of fat, viscous earth, well

CAU

beaten; serving either as a road, in wet marshy places, or as a mole to retain the waters of a pond, or prevent a river from overflowing the lower grounds.

* The word comes from the French *Chaussee*, antiently wrote *Chauslee*; and that from the Latin *Calciata*, or *Calcat*; according to Somner and Spelman, à *calando*. Bergier rather takes the word to have had its rise à *pedum calcetis*, quibus *teruntur*.

CAUSSIDICUS. See **ADVOCATE**.

CAUSTICS, in physic, those medicines which by their violent activity, and the heat thence occasioned, destroy the texture of the parts to which they are applied.

Caustics, amount to the same with what are otherwise denominated *Pyretics*, and *Ejcharotics*. They are also usually confounded with cauteries; though some distinguish them; restraining *Caustics* to those medicines which do not burn thro' the part, nor leave an eschar; and cauteries to those which do.

Caustics are used to eat off proud fungous flesh; they also penetrate within hard callous bodies, and liquify the humours; and are particularly applied in abscesses and imposthurations, to eat through to the suppurated matter, and give it vent: sometimes also to make issues in parts where cutting is difficult or inconvenient.

The principal medicines of this class, are burnt alum, sponge, cantharides, and other vesicatories; as also orpiment, calx viva, vitriol, albes of the fig-tree, the ash, and wine lees; the salt of the lixivium whereof soap is made; sublimate mercury, red precipitate, &c. See each described under its proper article.

Crytals of luna, and lapis infernalis, made of silver and spirit of nitre, become *Caustics* by that mixture.

CAUSTIC CURVE, in the higher geometry, a curve formed by the concurrence, or coincidence of the rays of light reflected, or refracted from some other curve.

Every curve has its twofold *Caustic*: accordingly, *Caustics* are divided into *Catacaustics*, and *Diacaustics*; the one formed by reflection, the other by refraction.

Caustic Curves, are usually supposed to be the invention of M. Tichirnhafen, who first proposed them to the academy of sciences, in 1682.—They have this remarkable property, that when the curves that produce them are geometrical, they are equal to known right lines.

Thus, the *Caustic* formed by reflected rays from quadrant of a circle, which came at first parallel to the diameter, is equal to $\frac{1}{2}$ of the diameter: which is a sort of rectification of curves that preceded the invention of the new doctrine of infinities, on which most of our rectifications are built.

The academy appointed a committee to examine the new curves, viz. Mell. Cassini, Mariotte, and De la Hire, which last doubted much of the description, or generation M. De Tichirnhafen gave of the *Caustic* by reflection from a quadrant of a circle. The author refused to discover all his method; and M. De la Hire persisted in holding the generation suspicious. M. Tichirnhafen, however, was so confident of it, that he sent it to the Leipzig journalists, though without any demonstration.

CAUSTIC-GLASSES. See the article **BURNING-GLASSES**.

CAUTERY,* **CAUTERIUM**, a medicine wherewith to burn, sear, eat through, or corrode some solid part of the body.

* The word is originally Greek, καυτης, or καυτηριον, formed from καω, I burn.

Cauteries are of two kinds, *Actual* and *Potential*.

Actual CAUTERIES, are those which produce an instantaneous effect: as, fire, or a red-hot iron; these are applied in the fistula lachrymalis, after extirpations of cancers, amputations of legs, or arms, &c. in order to stop the hæmorrhages, and produce a laudable supputation. They are sometimes also applied to carious bones, abscesses, and malignant ulcers, in order to open a passage for the discharge of the peccant humours. The irons used on these occasions, are sometimes crooked at the extremity, and that variously, according to the various occasions: whence some are called *Custellary*, others *Punctual*, others *Olivary*, &c.—M. Homberg assures us, that a great part of the medicine of the people of Java, and other parts of the East-Indies, consists in burning, or the application of *Actual Cauteries*; and that there is scarce any disease but they will happily cure thereby.

The *Actual Cautery*, or hot iron, is frequently applied for the making of issues, in parts where cutting is difficult or inconvenient: it makes a little round hole, which is to be filled up with a pea, or an ivy berry, to keep it open for the humours to pass through. Pareus describes a method of making *velvet*, or *silken Cauteries*; (*Cauteria serica vel bolsERICA*) so called, either because they give no pain, or because he purchased the secret at a dear rate from a certain chimney.

The *Cautery* described by Galen is a brazen tube, through which a little red-hot iron is thrust to the part.

Cauteries are chiefly applied to the nape of the neck, between the first and second vertebra, the exterior part of the arm, &c.

Potential CAUTERIES, are compositions of *caustic* medicines, usually of quick-lime, soap, and the like. See **CAUSTICS**.

CAUSWAY. See the article **CAUSEWAY**.

CAXA, a little coin, made of lead, mixed with scoria of copper; struck in China, but current chiefly at Bantam, in the rest of the island of Java, and in some of the neighbouring islands. See **COIN**.

It is somewhat smaller than the French double, and has a square hole through the middle; by means whereof, several of them are hung on the same string: this string, which they call *Santa*, usually contains two hundred *Caxas*, equivalent to nine French deniers, or somewhat less than three farthings sterling. Five *fantas* tied together, i. e. a thousand *Caxas*, make a *tapacou*.—Nothing can exceed the brittleness of the *Caxa*; a string never falls to the ground without breaking at least ten or twelve pieces. Leaving them a night steeped in salt water, they cling so firm to one another, that they are not to be separated without breaking one half of them. The Malays call them *Cas*, and the Javles, *Pitis*.

The *Caxas* are of two kinds, *great* and *small*: the *small* are those we have been speaking of; three hundred thousand whereof, are equal to fifty-six livres five sols, Dutch money. The *large* are old *Caxas*; six thousand whereof are equal to the piece of eight, or four shillings sixpence sterling. These are nearly the same with the *caches* of China, and the *casies* of Japan.

CAZEMATE,* in fortification, a kind of vault or arch of stonework, in that part of the flank of a bastion next the curtain; somewhat retired or drawn back towards the capital of the bastion; serving as a battery, to defend the face of the opposite bastion, and the moat, or ditch. See **BASTION**.

* The name comes from a vault, formerly made to separate the platforms of the upper and lower batteries; each of which was called in Italian *Casa Armata*, and in the Spanish *Casamata*. Though others derive the word from *Casa à Matti*, house of fools: *Covarruvias*, from *Casa* and *mata*, low house.

The *Cazemate*, sometimes, consists of three platforms, one above another; the highest being on the rampart: but they commonly content themselves to withdraw the last within the bastion.

The *Cazemate* is also called the *low place*, and *low flank*, as being at the bottom of the wall next the ditch; sometimes the *retired flank*, as being that part of the flank nearest the curtain, and the centre of the bastion: it was formerly covered with an epaulement, or a massive body either round or square, which prevented those without from seeing within the batteries; whence it was also called *covered flank*.

It is now rarely used, by reason the enemy's batteries are apt to bury the artillery of the *Cazemate* in the ruins of the vault: besides, that the terrible smok made by the discharge of the cannon, render it intolerable to the men. Hence, instead of the ancient *covered Cazemates*, later engineers have contrived open ones, only guarded by a parapet, &c.

CAZEMATE, is also used for a well with several subterraneous branches, dug in the passage of the bastion, till the miner is heard at work, and air given to the mine.

CEILING,* in architecture, the top, or roof of a lower room; or a covering of plaster, over laths nailed on the bottom of the joists that bear the floor of the upper room; or where there is no upper room, on joists for the purpose: hence called *Ceiling Joists*.

* The word *Ceiling* answers pretty accurately to the Latin *Lacunar*, every thing over head.

Plastered *Ceilings* are much used in England, more than in any other country: nor are they without their advantages, as they make the room lightsome; are good in case of fire; stop the passage of the dust; lessen the noise over head; and, in summer, make the air cooler.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. gr. e. None whose understanding is limited can be omniscient.

1. A Every man's understanding is limited;

r. Ent Therefore no man is omniscient.

CELEBATE,* or **CELEBACY**, the state of a person who lives out of marriage. See **MARRIAGE**.

* Scaliger derives the word from the Greek *καλη*, *bed*, and *ἀσπρω*, *linque*, I leave: others say it is formed from *celi* *beatitudo*, q. d. the blissfulness of heaven.

The *Celebate* of the clergy, which is still rigorously kept up among the Romanists, is of a pretty ancient standing: it was first proposed by the council of Nice, but without passing; it was, however, in some measure admitted by the western councils of Elvira, Arles, Tours, &c. though not absolutely enjoined. Such among the priests as piqued themselves on the faculty of continence took the hint; inasmuch, as towards the close of the fourth century, there were few but made a profession of a voluntary *Celebate*. In 441, the council of Orange ordered those to be deposed who did not abstain from their wives: but it was

Gregory the seventh, who first brought ecclesiasticks to admit the *Celebate* as a law. In the council of Trent, it was proposed to fet the clergy at liberty again from the yoke of *Celebate*; and this was even made an article of the Interim of Charles the fifth, but the pope could not be brought into it.

St. Jerom and Epiphanius observe, that in their time none were admitted into the priesthood, but those who were unmarried, or who abstained from their wives.

CELERES,* in antiquity, a body, or regiment of guards of the ancient Roman kings, established by Romulus; consisting of three hundred youths chosen from the best families of Rome, and approved by the suffrages of the Curiae of the people, each of which furnished ten.

* The name comes from *Celer*, *quick*, *ready*; and was given them, because of their promptness to obey the king; or, as some will have it, from the name of their first tribune; others say, from one *Celer*, a comrade of Romulus, who assisted him in the combat with his brother Remus, and is said to have slain that Prince.—Some say, the *Celeres* were the same with those afterwards called *Troscilli*, on account of their taking the city Trofulum in Etruria, alone, without the assistance of any infantry.

The *Celeres* always attended near the king's person, to guard him, and to be ready to carry his orders, and to execute them. In war, they made the vanguard in the engagement, which they always began first: in retreats, they made the rear-guard.

Though the *Celeres* were a body of horse, yet they usually dismounted, and fought on foot: their commander was called *Tribune*, or *Præfæct* of the *Celeres*. They were divided into three troops, of one hundred each, commanded by a captain called *Centurio*. Their tribune was the second person in the kingdom. See **TRIBUNE**, **CAVALRY**, &c.

Plutarch says, Numa broke the *Celeres*: if this be true, they were soon re-established; for we find them under most of the succeeding kings: witness the great Brutus who expelled the Tarquins, and who was tribune of the *Celeres*.

CELERITY, in mechanics, is the velocity of a moving body; or that affection of a body in motion, whereby it is enabled to pass over a certain space, in a certain time. See **VELOCITY**; see also **MOTION**.

CELESTINS, an order of religious, reformed from the Bernardines, in 1224, by pope Celestin the fifth, then only Peter de Mourchon, or Morron, of Isernia in Naples; and established in 1264, by pope Urban the fourth, and confirmed by Gregory the tenth, in 1274.

They were introduced into France by Philip the Fair, who requested a dozen of them from the general of their order, by his ambassador at Naples, in 1300.—It is a kind of proverb with them, *Voilà un plaisant Celestin*.

CELIAC, or **COELIAC** Passion. See the article **COELIAC**.

CELLITES, **CELLITE**, an order of religious, founded by Alexius a Roman: in Italy they are called *Alexians*; but in Germany and the Low-countries, where they have monasteries, *Cellites*, i. e. people inhabiting in cells.

CELLS,* **CELLÆ**, **CELLULÆ**, are little houses, apartments, or chambers; particularly those wherein the ancient monks, solitaries, and hermits lived in retirement.

* Some derive the word from the Hebrew *סֵלֶם*, i. e. a prison, or place where any thing is shut up.

The same name is still retained in divers monasteries. The dormitory is frequently divided into so many *Cells*, or lodges.

The Carthusians have each a several house, which serves them as a *Cell*.

The hall wherein the Roman conclave is held, is divided by partitions into divers *Cells* for the several cardinals to lodge in.

CELLS, in anatomy, are little bags, or bladders, where fluids or other matters are lodged; called also *Loculi*, *Cellule*, &c.

The name is also given by botanists to the partitions in the husks, or pods where the seeds of plants lie.

CELLS, are also the little divisions, or apartments in honey-combs, where the honey, young bees, &c. are distributed: these are always regular hexagons.

CELLULÆ, *Adiposæ*, in anatomy, the *Loculi*, or little *Cells* wherein the fat of bodies in good habit is contained. See **ADIPS** and **ADIPOSE**.

These are co-extended with the skin itself, except on the forehead, the eyelids, penis, and scrotum. In emaciated bodies, these *Cells* being unfurnished of their fat, appear like a kind of flaccid, transparent membrane.

CEMENT, or **CÆMENT**. See the article **CÆMENT**.

CEMENTATION, or **CÆMENTATION**. See **CÆMENTATION**.

CENOBITE, or **COENOBITE**. See **COENOBITE**.

CENOTAPH,* *Kevotastio*, an empty tomb, or a monument without a body under it; erected only by way of honour to the deceased.

* The word is originally Greek, compounded of *κεν*, *empty*, and *τάφος*, *tomb*.

CENSER. See the article **ALTAR**.

CEN

CENSOR,* in antiquity, one of the prime magistrates in ancient Rome; whose business was to survey, and rate the people, and to inspect and correct their manners.

* The word is derived from *Censere*, because he ascertained and valued every man's estate, registering their names, and placing them in a proper century, that the Romans might know their own strength: though others say, the *Censuri* were so called on account of their other office, *viz.* as being controllers, or correctors of manners and policy.

There were two *Censors*, first created in the year of Rome 311, upon the senate's observing, that the consuls were too much taken up with matters of war, to be at leisure for looking near enough into private affairs. The two first were Papirius and Sempronius: their authority extended over every person; and they had a right to reprehend the highest. At first they were taken out of the senate; but after the plebeians had got the consulate open to them, they soon arrived at the *Censorship*: M. Rutilius was the first; who having been twice consul, and dictator, in the year 402 demanded the office of *Censor*.—The custom was, to elect two; the one of a patrician family, the other, a plebeian: and upon the death of either, the other was discharged from his office, and two new ones elected; but not till the next lustrum.—In the year 414, a law was made, appointing one of the *Censors* to be always elected out of the plebeians; which held in force till the year 622; when both *Censors* were chosen from among the people; after which time, it was shared between the senate and people.

This office was so considerable, that none aspired to it till they had passed all the rest: so that it was looked on as surprizing, that Crassus should be admitted *Censor*, without having been either consul or pretor.—The term of this office was at first established for five years; but that institution only lasted nine: Maerminus the dictator, in the year 420, made a law, restraining the *Censure* to a year and an half; which was afterwards observed very strictly.

The business of the *Censors*, was to register the effects, &c. of the Roman citizens; and to impose taxes, in proportion to what each person possessed. Cicero reduces their functions to the numbering of the people; the correction and reformation of manners; the estimating the effects of each citizen; the proportioning of taxes; the superintendence of tribute; the exclusion from the temples; and the care of the public places. They had also a right, *senatu ejicere*, to expel from the senate such of the members as they judged unworthy of the dignity; as well as to break and cashier the knights who failed in their duty, by taking from them the public horse, *equum adimere*.

The republic of Venice, has at this day a *Censor* of the manners of their people, whose office lasts six months.

CENSORS of books, are a body of doctors, or other officers, established in divers countries, to examine and give their judgment of all books, ere they go to the press; and to see they contain nothing contrary to the faith, and good manners.—In England we had formerly an officer of this kind, under the title of *Licensor of the press*; but since the revolution the press has been open.

M. Bayle compares authors soliciting the approbation of *Censors*, or licensors, to the shades wandering on the banks of Styx, and waiting with impatience for a passage to the other shore. He applies to them these two verses of Virgil.

*Tententque manus, ripæ ulterioris amore:
Navita sed tristis munc hos munc accipit illos.*

At Paris, the faculty of Theology claim the privilege of *Censors*, as granted to them by the pope; and it is certain they had been in possession of it for many ages: but in the year 1624, a new commission of four doctors were created, by letters patent, the sole public or royal *Censors*, and examiners of all books; and answerable for every thing contained therein. The faculty, however still maintain their claim, by taking occasion, now and then, to give their approbations to books.

CENSURE, CENSURA, is popularly used for a judgment, whereby some book, person, or action, is blamed or condemned; more particularly for a reprimand made by a superior, or person in authority.

Ecclesiastical CENSURES, are the public menaces which the church makes, or pains and penalties incurred by disobeying what she enjoins; or rather, the pains and punishments themselves; as interdiction, excommunication, &c.

Till the time of the reformation, the kings of England were subject to the *Censures* of the church of Rome; but the kings of France have always maintained themselves exempt from them. In effect, there is no instance of excommunication of any of their first race of kings, till Lotharius's excommunication by pope Nicholas I. for putting away his wife Tetberge; which is reckoned the first breach of the liberties of the Gallican church: yet the pope durst not hazard his excommunication on his own authority, but took care to have it confirmed by the assembly of the bishops of France; and the same precaution was afterwards observed by the other popes. But in after times the French kings asserted their rights to better purpose; for pope Benedict XIII. having censured Charles VI. laid the nation under an interdict:

CEN

upon which the parliament of Paris, by an arret in 1468. ordered the bull to be torn; and Julius II. having excommunicated Louis XII. the assembly general at Tours censured the popes *Censure*.

The canonists distinguish two kinds of *Censures*; the one *de jure*, the other *de facto*, or by sentence.

CENSURE, is also a custom in several manors in Cornwall and Devon, whereby all the tenants above the age of sixteen, are called to swear fealty to the lord, to pay two-pence per poll, and a penny per annum, ever after, as cert-money, or common fine. See CERT-MONEY.

CENSUS, among the Romans, was an authentic declaration made by the several subjects of the empire, of their respective names, and places of abode, before proper magistrates, in the city of Rome, called *Censuri*; and in the provinces *Censituri*, by whom the same were registered.

This declaration was accompanied with a catalogue, or enumeration in writing, of all the estates, lands, and inheritances they possessed; their quantity, quality, place, wives, children, tenants, domestics, slaves, &c.

The *Census* was instituted by king Servius; and was held every five years. It went through all the ranks of people, though under different names: that of the common people was called *Census*, or *Lustrum*; that of the knights *Census*, *Recensio*, *Recognitio*; that of the senators, *Lexis*, *Relectio*.

Hence, also, *CENSUS* came to signify a person who had made such a declaration: in which sense it was opposed to *incensus*, a person who had not given in his estate or name to be registered.

In the Voconian law, *CENSUS* is also used for a man, whose estate, in the *Censor's* books, is valued at 100000 sesterces.

CENTAUR,* *CENTAURUS*, in astronomy, a part or moiety of a southern constellation, in form, half man, half horse, usually joined with the wolf.

* The word comes from the Greek *κентаυρος*; formed of *κηνταυρος*, *pungere*, and *ταυρος*, bull, q. d. Bull-pricker.

CENTAURUS cum Lupo, *CENTAUR with the Wolf*, in astronomy, a constellation of the southern hemisphere; whose stars, in Ptolemy's catalogue, are nineteen; in Tycho's four; in the Britannic catalogue, thirteen. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and Situations of the Stars.	Longitude.	Latitude.	Magnet.
	° ' ''	° ' ''	
Inform. before the head	25 42	21 33 13	5
Preced. in the head of the Centaur	2 22	1 20 33	4 5
South. in the head.	3 41	21 34 24	4 5
Middle	8 35 20	2 20 20	4 5
Subseq. and north. in the head	3 26 53	18 56 15	4 5
5			
In hind shoulder of the Centaur	8 0 18	21 59 0	2 3
South. of 2 in anterior foot of wolf	20 21 34	12 57 45	5 6
Subseq. and north. of the same	20 39 49	11 28 1	5 6
Prec. of cont. before neck of lupus	23 10 26	17 6 56	4 6
Subsequent	23 37 3	17 37 52	5 6
10			
Preced. of 2 in the wolf's nose	26 21 24	14 25 38	5 6
Contiguous to that	27 2 37	14 34 8	5 6
Subseq. in the nose	28 30 10	13 7 23	5 6

CENTAURY the Lesser, *CENTURIUM Minus*, is a small and low plant, with leaves growing by pairs, and a flower consisting of a purple petal, cut into five segments, and a tubulous calyx divided in like manner.—Its leaves are esteemed a good bitter, and very serviceable to the stomach, either in the compositions of that kind, or *per se*, in decoction or infusion, which is best made in wine. It dissolves and absterges viscid humours; is good against worms, and by some also is extolled as an Alexipharmic, Febrifuge, &c.

CENTER, or CENTRE,* in a general sense, denotes a point equally remote from the extremes of a line, figure, or body: or the middle of a line, or plane, by which a figure or body is divided into two equal parts.

* The word is Greek, *κέντρον*, which primarily signifies a point; being formed from the verb *κέντρον*, *pungere*, to prick.

CENTER of a Bastion, is a point in the middle of the gorge of the Bastion, whence the capital line commences; and which is ordinarily at the angle of the inner polygon of the figure. See BASTION, &c.

CENTER of a Battalion, the middle of a battalion; where is usually left a large square space, for lodging the cloaths and baggage.

CENTER of a Circle, is a point in the middle of a circle, or circular figure, from which all lines drawn to the circumference are equal.

Euclid demonstrates, that the angle at the *Center* is double to that at the circumference; *i. e.* the angle made by two lines drawn from the extremes of an arch to the *Center*, is double that made by two lines drawn from those extremes to a point in the circumference.

CENTER of a Conic Section, is the point wherein all the diameters concur.

This point, in the ellipsis, is within the figure; and, in the hyperbola, without.

CENTER of a Curve, of the higher kind, is the point where two diameters concur.

Where all the diameters concur in the same point, Sir Isaac Newton calls it, the *general Center*.

CENTER of a Dial, is that point where its gnomon or stile, which is placed parallel to the axis of the earth, intersects the plane of the dial; and from thence, in those dials which have *Centers*, all the hour-lines are drawn. If the plane of the dial be parallel to the axis of the earth, it can have no *Center* at all; but all the hour-lines will be parallel to the style, and to one another.

CENTER of an Ellipsis, is that point where the two diameters, the transverse and the conjugate, intersect each other.

CENTER of Gravitation, or *Attraction*, in physics, is that point to which a revolving planet, or comet, is impelled, or attracted by the force or impetus of gravity.

CENTER of Gravity, in mechanics, is a point within a body, through which if a plane pass, the segments on each side will be equal, and equi-ponderate, i. e. neither of them can move the other.

Hence, if the descent of the *Center* of gravity be prevented, or if the body be suspended by its *Center* of gravity, it will continue at rest.

The whole gravity of a body may be conceived united in its *Center*; and therefore, in demonstrations, it is usual for the body to substitute the *Center*.

Through the *Center* of gravity passes a right line, called the *Diameter of Gravity*: the intersection, therefore, of two such diameters determines the *Center*.

The plane whereon the *Center* of gravity is placed, is called the *Plane of Gravity*: so that the common intersection of two such planes determines the diameter of gravity.

In homogeneous bodies, which may be divided lengthwise into similar and equal parts, the *Center* of gravity is the same with the *Center* of magnitude. If, therefore, a line be bisected, the point of section will be the *Center* of gravity.

Common CENTER of gravity of two bodies, is a point so situated, in the right line joining the *Centers* of the two bodies, as that, if the point be suspended, the two bodies will equiponderate, and rest in any situation.—Thus, the point of suspension in a common balance, or in a Roman stilyard, where the two weights equi-ponderate, is the common *Center* of gravity of the two weights.

Laws of the CENTER of gravity.—1. If the *Centers* of gravity of two bodies A and B, (Tab. *Mechan.* fig. 13. n°. 2.) be joined by the right line AB, the distances BC and CA of the common *Center* of gravity C, from the particular *Centers* of gravity B and A, are reciprocally as the weights A and B: see this demonstrated under *BALANCE*.

Hence, if the gravities of the Bodies A and B be equal, the common *Center* of gravity C, will be in the middle of the right line AB. Again, since A:B::BC:AC; it follows that A.A.C::B.B.C; whence it appears, that the powers of equi-ponderating bodies are to be estimated by the factum of the mafs, multiplied into the distance from the *Center* of gravity; which factum is usually called the *Momentum* of the weights.

Further, since A.B::B.C:AC, A+B:A::B.C+AC:BC. The common *Center* of gravity, therefore C, of two bodies, will be found, if the factum of one weight A, into the distance of the separate *Centers* of gravity AB, be divided by the sum of the weights A and B. Suppose, v.g. A=12, B=4, A.B=24; therefore, B.C=24. 12:16=18. If the weight A be given, and the distance of the particular *Centers* of gravity AB, together with the common *Center* of gravity C; the weight of B will be found = to A.A.C:BC; that is, dividing the moment of the given weight, by the distance of the weight required from the common center of gravity. Suppose, A=12, B.C=18, A.C=6; then B=6, 12:18=12:3=4.

2. To determine the common *Center* of gravity of several given bodies a, b, c, d, (fig. 13.) in the right line AB. Find the common *Center* of gravity of the two bodies a and b, which suppose in F; conceive a weight a+b, applied in F; and in the line FE, find the common *Center* of the weights a+b and c; which suppose in G. Lastly, in BG, suppose a weight a+b+c applied, equal to the two a+b and c; and find the common *Center* of gravity between this and the weight d, which suppose in H: this H will be the common *Center* of gravity of the bodies a, b, c, d. And in the same manner might the common *Center* of gravity of any greater number of bodies be found.

3. Two weights D and E, (fig. 14.) being suspended without their common *Center* of gravity in C, to determine which of them preponderates, and how much. Multiply each into its distance from the *Center* of suspension; that side on which the factum is greatest, will preponderate; and the difference between the two, will be the quantity wherewith it preponderates.

Hence, the momenta of the weights D and E, suspended without the *Center* of gravity, are in a ratio compounded of the

weights D and E, and the distances from the point of suspension. Hence also the momentum of a weight suspended in the very point C, will have no effect at all in respect of the rest D.E.

4. To determine the preponderation where several bodies a, b, c, d, (fig. 15.) are suspended without the common *Center* of gravity in C. Multiply the weights c and d into their distances from the point of suspension CE and EB; the sum will be the momentum of their weights, or their ponderation towards the right: then multiply the weights a and b into their distances, A.C and CD, the sum will be the ponderation towards the left: subtracting therefore, the one from the other, the remainder will be the preponderation required.

5. Any number of weights, a, b, c, d, being suspended without the common *Center* of gravity in C, and preponderating towards the right; to determine the point F, from whence the sum of all the weights being suspended, the ponderation shall continue the same as in their former situation.

Find the momentum wherewith the weights c and d preponderate towards the right; since the momentum of the sum of the weights to be suspended in F, is to be equal to it, the momentum now found, will be the factum of CF into the sum of the weights: this, therefore, being divided by the sum of the weights, the quotient will be the distance CF, at which the sum of the weights is to be suspended, that the preponderation may continue the same as before.

6. To find the *Center* of gravity in a parallelogram and parallelepiped. Draw the diagonals AD and EG, (Fig. 16.) likewise CB and HF; since each diagonal, AD and CB, divides the parallelogram ACDB into two equal parts, each passes through the *Center* of gravity; consequently, the point of intersection I, must be the *Center* of gravity of the parallelogram. In like manner, since both the plane CBFH and ADGE, divide the parallelepiped into two equal parts, each passes through its *Center* of gravity; so that the common intersection IK, is the diameter of gravity, the middle whereof is the *Center*.

After the same manner may the *Center* of gravity be found in prisms and cylinders; it being the middle point of the right line that joins the *Centers* of gravity of their opposite bases.

7. In regular polygons, the *Center* of gravity is the same with the *Center* of the circumscribed parallelogram.

8. To find the *Center* of gravity of a cone and a pyramid. The *Center* of gravity of a cone, is in its axis AC, (Fig. 17.) If then AP=x, Pp=d x, the weight in the same cone is $\pi r^2 d x \cdot 2a^2$; and therefore its momentum $\pi r^2 d x \cdot 2a^2$. Hence the sum of the momenta $\pi r^2 d x \cdot 8a^2$; which divided by the sum of the weights $\pi r^2 d x \cdot 6a^2$, gives the distance of the *Center* of gravity of the portion AMN, from the vertex A=6 a² $\pi r^2 d x \cdot 8a^2 \pi r^2 d x = \frac{2}{3} x$ AP: wherefore, the *Center* of gravity of the entire cone, is distant from the vertex, $\frac{2}{3}$ of AC. And in the same manner is found the distance of the *Center* of gravity from the vertex of the pyramid $\frac{3}{4}$ AC.

9. To determine the *Center* of gravity in a triangle BAC (Fig. 18.) Draw the right line AD, bisecting the base BC in D; since $\triangle BAD = \triangle DAC$, each may be divided into the same number of little weights, applied in the same manner on each side to the common axis AD: so that the *Center* of gravity of the $\triangle BAC$, will be in AD. To determine the precise point in that, let AD=a, B.C=b, P=x, MN=y; then will AP:MN::AD:BC

$$x:y::a:b$$

Hence, $y = \frac{b}{a} x$. Draw AE perpendicular to BC; then AD:AE::AP:AQ; and therefore, A.Q=ex:a, and Qq=c dx:a. Whence, the momentum $y \cdot x dx = \frac{b}{a} x^2 dx : a^2$, and $\int y \cdot x dx = \frac{b}{a} x^3 : 3a^2$; which sum divided by the area of the triangle AMN=c b x²:2 a², gives the distance of the *Center* of gravity from the vertex = $\frac{2}{3} a b x^3 : 3 a b x^2 = \frac{2}{3} x$. If then for x, be substituted a, the distance of the *Center* of gravity of the \triangle , from the vertex, will be found $\frac{2}{3} a$.

10. For the *Center* of gravity in a parabola, (Fig. 19.) Its distance from the vertex A, is found the space AF. In a cubical paraboloid, the distance of the *Center* from the vertex, is $\frac{3}{8}$ AP. In a biquadratic paraboloid, $\frac{5}{8}$ AP. In a exterior parabola AST, the *Center* of gravity is at the distance AL. In the cubical paraboloid, $\frac{3}{8}$ AQ. In a biquadratic paraboloid, $\frac{5}{8}$ AQ. In a surd-solid paraboloid, $\frac{5}{8}$ AQ.

11. The *Center* of gravity in the arch of a circle, is distant from the *Center* of the arch by a line, which is a third proportional to the quadrant and the radius.—In a sector of a circle, the distance of the *Center* of gravity from the *Center* of the circle, is to the distance of the *Center* of gravity of the arch, as two to three.

For the *Center* of gravity of segments, lines, parabolic conoids, spheroids, truncated cones, &c. as being cases more operose, and at the same time more out of the way; we refer to Wolfius and others.

12. To determine the *Center* of gravity in any body mechanically. Lay the given body HI, (fig. 20.) on an extended rope, or on the edge of a triangular prism FG, bringing it this and that way, till the parts on either side are in *Æquilibrium*; the plane, whose side is KL, passes through the *Center* of gravity. Balance it again on the same, only changing its situation; then

will the cord or the side MN, pass through the *Center* of gravity; so that the intersection of the two lines MN and KL, determines the point O in the surface of the body required. The same may be done by laying the body on a horizontal table, (as near the edge as is possible, without its falling) in two positions, lengthwise and breadthwise: the common intersection of the two lines contiguous to the edge, will be its *Center* of gravity. Or, it may be done by placing the body on the point of a style, &c. till it rest in equilibrium. It was by this method, Borelli found the *Center* of gravity in an human body, to be between the nates and pubis; so that the whole gravity of the body is there collected, where nature has placed the genitals: An instance of the wisdom of the creator, in placing the membrum virile in that place, which of all others is the most convenient for the affair of copulation.

13. "Every figure, whether superficial or solid, generated by the motion of a line, or figure, is equal to the factum of the generating magnitude, multiplied into the way of its *Center* of gravity, or the line its *Center* of gravity describes." See the demonstration heretof, under the article CENTRO BARYC Method.

The preceding elegant theorem is looked on as one of the noblest geometrical discoveries made in the last age; and is the foundation of the methodus centro-baryta. Pappus, indeed, gave the first hint long ago; but it was the great Guldinus that brought it to maturity. Leibnitz shews it will hold, if the axis, or *Center*, be continually changed during the generating motion: The corollaries are too numerous to be here detailed.

CENTER of an Hyperbola, is a point in the middle of the determinate or transverse axis.

CENTER of Motion, is a point round which one or more heavy bodies, that have one common *Center* of gravity, revolve; v. gr. If the weights P and Q (Tab. Mechanics, fig. 21.) revolve about the point N, so as when P descends, Q ascends, N is said to be the *Center* of motion.

It is demonstrated in mechanics, that the distance IN, of the *Center* of gravity of any particular weight, from the common *Center* of gravity, or the *Center* of motion N, is perpendicular to the line of direction Ip.

CENTER of Oscillation, a point wherein, if the whole gravity of a compound pendulum be collected, the several oscillations will be performed in the same time as before.

Hence, its distance from the point of suspension, is equal to the length of a simple pendulum, whose oscillations are isochronal with those of the compound one.

Laws of the CENTER of Oscillation. 1. If several weights DFHB, (Tab. Mechanics, fig. 22.) whose gravity is supposed collected in the points DFHB, constantly retain the same distance between themselves and the point of suspension A; and the pendulum thus compounded, performs its oscillations about A; the distance of the *Center* of oscillation O, from the point of suspension OA, will be had by multiplying the several weights into the squares of the distances, and dividing the aggregate by the sum of the momenta of their weight.

2. To determine the *Center* of oscillation in a right line AB, (fig. 23.) Let AB = d , AD = x , then will the infinitely small particle DP = dx , be the momentum of its weight $x dx$; consequently the distance of the *Center* of oscillation in the part AD, from the point of suspension A = $\int x^2 dx : \int x dx :: \frac{1}{3} x^3 : \frac{1}{2} x^2$. If then for x be substituted a , the distance of the *Center* of oscillation in the right line AB = $\frac{1}{3} a$. In this manner is found the *Center* of oscillation of a wire, oscillating about one of its extremities.

3. To determine the *Center* of oscillation of the rectangle RIHS, (fig. 19.) suspended in the middle point A, of the side RI, and oscillating about its axis RI. Let RI = SH = a , AP = x ; then will Pp = dx , and the element of the area; consequently one weight = $a dx$, and its momentum $a x dx$. Wherefore, $\int a x dx = \frac{1}{2} a x^2 : \int a dx = \frac{1}{2} a x$, indefinitely expresses the distance of the *Center* of oscillation, from the axis of oscillation in the segment RCDI. If then for x be substituted the altitude of the whole rectangle RSH, we shall have the distance of the *Center* of oscillation from the axis = $\frac{1}{3} h$. For the *Center* of oscillation in an isosceles triangle, ASH, oscillating about its axis RI, parallel to its base SH; its distance from the vertex A, is found = $\frac{2}{3}$ AE the altitude of the triangle. Of an equilateral triangle SAH oscillating about its base SH, its distance from the vertex A is found = $\frac{1}{3}$ AE the altitude of the triangle.

For the *Center* of oscillation in an equilateral triangle SAH, suspended by an inflexible thread void of gravity, A h, and oscillating about its axis parallel to its base SH; its distance from the vertex, is found = $\frac{1}{3}$ the altitude of the triangle.

For the *Centers* of oscillation of parabolas, and curves of the like kind, oscillating about their axis, parallel to their bases, they are found to be as follows.

In the Apollonian parabola, the distance of the *Center* from the axis, = $\frac{1}{2}$ AE.

In a Cubical paraboloid, the distance of the *Center* of oscillation from the axis = $\frac{1}{4}$ AE.

In a Biquadratic paraboloid, the distance of the *Center* from the axis, = $\frac{1}{5}$ AE.

In solid and plane figures agitated laterally, i. e. about the axis

of oscillation, perpendicular to the plane of the figure, the investigation of the *Center* of oscillation is somewhat difficult; in regard all the parts of the weight, by reason of their unequal distance from the point of suspension, do not move with the same velocity; as is shewn by Huygens, in his *Horol. Oscill.* He found, in this case, the distance of the *Center* of oscillation, from the axis in a circle, to be $\frac{1}{2}$ of the diameter: in a rectangle, suspended by one of its angles, $\frac{1}{2}$ of the diagonal: in a parabola, suspended by its vertex, $\frac{1}{2}$ of its axis, and $\frac{1}{2}$ of the parameter; suspended from a point in the middle of the base, $\frac{1}{2}$ of the axis, and $\frac{1}{2}$ the parameter; in the sector of a circle, $\frac{1}{2}$ of a right line which is to the radius as the arch to the subtense: in a cone, $\frac{1}{2}$ of the axis, and $\frac{1}{2}$ of the third proportional to the axis, and a semi-diameter of the base: in a sphere, suspended from a point in the surface, $\frac{1}{2}$ of the diameter: in the same, suspended from a point without the sphere, (as is usually the case in pendulums) $\frac{1}{2}$ of a third proportional to two quantities composed of the semi-diameter and length of the thread, and the semi-diameter itself: in a cylinder, $\frac{1}{2}$ of the altitude, and $\frac{1}{2}$ a right line, which is to the semi-diameter of the base, as that is to the altitude.

CENTER of Percussion, in a moving body, is that point wherein the percussion is the greatest, wherein the whole percussive force of the body is supposed to be collected: or about which the impetus of the parts is balanced on every side. See PERCUSSION.

Laws of the CENTER of Percussion. — 1. The *Center* of Percussion is the same with the *Center* of Oscillation, where the percussive body revolves round a fixed point; and is determined in the same manner, viz. by considering the impetus of the parts, as so many weights applied to an inflexible right line, void of gravity; i. e. by dividing the sum of the factums of the impetus of the parts, multiplied by their distances from the point of suspension, by the sum of the impetus. What, therefore, has been above shewn of the *Center* of Oscillation, will hold of the *Center* of Percussion, where the percussive body moves round a fixed point. See *CENTER of Oscillation*.

2. The *Center* of Percussion is the same with the *Center* of Gravity, if all the parts of the percussive body be carried with a parallel motion, or with the same celerity: for the momenta are the facts of the weights into the celerities. Wherefore, to multiply equipoponderating bodies by the same velocity, is the same thing as to take equi-multiples; but the equi-multiples of equi-ponderating bodies, themselves equi-ponderate; therefore, equivalent momenta are disposed about the *Center* of gravity: consequently the *Center* of percussion in this case, coincides with that of gravity; and what is shewn of the one, will hold of the other.

CENTER of Conversion, in mechanics, a term first used by M. Parent. Its signification is thus conceived: if a stick be laid on a stagnant water, and drawn by a thread fastened to it, so that the thread always makes the same angle with the stick; always, v. g. a right angle; the stick will be found to turn on one of its points, which will be immovable; which point is termed the *Center* of Conversion. For the greater ease, the thread may be conceived fastened to one end of the stick.

This effect arises from the resistance of the fluid, and the manner wherein it divides: for, imagine the first moment of traction; it is certain, here, the resistance of the parts of the fluid to be displaced, tends to turn the stick around the point to which the thread is fastened, as on a *Center*: so that in the present instance, the staff would describe precisely the quadrant of a circle: after which, the fluid would no longer bear the stick lengthwise; but in a particular motion, in such manner, as that the free end of the stick, and the parts nearest it, would describe larger arches of circles than the rest, and have a greater velocity. The resistance therefore of the fluid, which tends to impress a circular motion on the stick, around the point to which the thread is fastened, tends to impress a greater velocity on the parts next the other extremity; or, which is the same thing, those parts require a greater velocity to surmount the resistance of the fluid: so that the stick will not have that circular motion around the point to which the thread is fastened; or, the resistance of the fluid is greater towards the free extreme of the stick, and still lessens towards the other extreme. Now, all the columns, or threads of water, which resist the stick, must be supposed of the same length, or the same mass. One may therefore find on the stick such a point, as that taking a great number of those threads on that side which resists the least, and a less number on that side where they resist the most; there will be an exact compensation, and the forces be equal on each side: it is this point is the *Center* of Conversion. And as the same reasoning has place in all motions of traction made in the same manner, this *Center* is always the same point.

The grand question here arising, is to know precisely in what point the *Center* of conversion is found: this M. Parent has determined by an infinite deal of calculation. If the stick drawn by one extremity be a straight line divided into twenty parts, reckoning from the thread, the *Center* of conversion, he finds, will be nearly on the 13th. If it be not a line, but a surface or a solid, there will be some change in the situation of the *Center* of conversion, according to the surface or the solid.

If in lieu of a body swimming in a fluid, we suppose it laid on a rough uneven plane; the resistance of this plane to the motion of the body, will always be divided in the same manner, and determine the same *Center* of conversion. This resistance is, precisely, what we call *friction*, so prejudicial to the effects of machines.

CENTER of a Parallelogram, or Polygon, the point wherein its diagonals intersect.

CENTER of a Sphere, is a point from which all the lines drawn to the surface, are equal.

The *Center of the Semicircle*, by whose revolution the sphere is generated, is also that of the sphere.

Hermes Trismegistus defines God an intellectual sphere, whose *Center* is every where, and circumference no where.

CENTO,* in poetry, a work wholly composed of verses, or passages promiscuously taken from other authors; only disposed in a new form, or order: so as to compose a new work, and make a new meaning.

* The word is Latin, *Cento*, which primarily signifies a cloak made of patches; and that from the Greek *κεντρον*: the Roman soldiers used these *Centos*, or pieces of old stuff patched over each other, to guard themselves from the strokes of their enemies. Though others say, that *Centos* were properly the patches of leather, &c. wherewith their galleries or screens, called *Vinea*, were covered; under which the besiegers made their approaches towards any place.

Aufonius has laid down the rules to be observed in composing *Centos*. The pieces, he says, may be taken either from the same poet, or from several; and the verses may be either taken entire, or divided into two; one half to be connected with another half taken elsewhere: but two verses are never to be taken running, nor is much less than half a verse to be taken. Agreeably to these rules, he has made a pleasant nuptial *Cento* from Virgil.

Proba Falconia has wrote the life of Jesus Christ, in *Cento's* taken from Virgil: the like done by Alex. Ross, in his *Christiador*; and by Stephen de Pleurre, canon regular of St. Victor at Paris; an instance of whole *Cento's*; on the adoration of the Magi, is as follows.

Adoratio Magorum, Matt. 2.

6. *Æn.* 255. *Ecce autem primi sub lumina solis, & ortus,*
 2. *Æ.* 694. *Stilla facem ducens multa cum luce cucurrit:*
 5. *Æ.* 526. *Signavitque Fiam* caeli in regione ferena.* 8. *Æ.* 528.
 8. *Æ.* 530. *Tum Reges: (credo quia sit divinitus illis)* 1. *G.* 415.
 1. *G.* 416. *Ingenuum, & rerum fatis prudentia major*
 7. *Æ.* 98. *Extremi orantur: quæ cuique est copia læti* 5. *Æ.* 100.
 11. *Æ.* 333. *Manera portantes: molles sua thura Sabæi,* 1. *G.* 57
 3. *Æ.* 464. *Dona debinc auro gravia, myrraque moventes* 12. *Æ.* 100.
 9. *Æ.* 659. *Agnovere Deum Regem, Regumque Parentem.* 6. *Æ.* 548.
 1. *G.* 418. *Mutaveræ vias, perfectis ordine votis:* 10. *Æ.* 548.
 6. *Æ.* 16. *Injunctum per iter, spolia in sua quisque recepit.* 12. *Æ.* 126.

CENTRAL, something relating to a *Center*. See **CENTER**. Thus, we say, *Central Eclipse*, *Central Fire*, *Central Forces*, *Central Rule*, &c.

CENTRAL Forces, the vires, or powers whereby a moving body either tends towards the center of motion, or recedes from it. *Central Forces* are divided into two kinds, with regard to their different relations to the center, viz. the *Centripetal*, and the *Centrifugal*.

Laws of CENTRAL Forces. 1. The following rule, for which we are obliged to the Marquis de l'Hôpital, opens at once all the mysteries of *Central Forces*: suppose a body of any determinate weight to move uniformly round a center with any certain velocity; find from what height it must have fallen to acquire that velocity: then, as the radius of the circle it describes is to double that height, so is its weight to its centrifugal force. Hence, it is easy to infer, that,

2. If two bodies, equal in weight, describe peripheries of unequal circles in equal times, their *Central Forces* are as their diameters AB, and HL. (Tab. *Mechanicks*, fig. 25.) And hence, if the *Central Forces* of two bodies, describing peripheries of two unequal circles, be as their diameters, they pass over the same in equal times.

3. The *Central Force* of a body moving in the periphery of a circle, is as the square of the infinitely small arch AE, divided by the diameter AB. Since then a body, by an equable motion, in equal times describes equal arches AE; the *Central Force* wherewith the body is impelled in the periphery of the circle, is constantly the same.

4. If two bodies describe different peripheries by an equable motion, their *Central Forces* are in a ratio, compounded of the duplicate ratio of their celerities, and the reciprocal one of their diameters. Hence, if the celerities be equal, the *Central forces* will be reciprocally as their diameters; and if the diameters AB and HL be equal, i. e. if each moveable proceed in the same periphery, but with unequal celerities, the *Central forces* will be in a duplicate ratio of the velocities.

If the *Central forces* of the two bodies moving in different peripheries be equal, the diameters of the circles AB, and HL, will be in a duplicate ratio of the celerities.

5. If two bodies, moving in unequal peripheries, be acted on by the same *Central force*, the time in the larger is to that in the smaller, in a subduplicate ratio of the greater diameter AB, to the less HL; wherefore, $T^2::D:d$, that is, the diameters of the circles in whose peripheries those bodies are acted on by the same *Central force*, are in a duplicate ratio of the times. Hence also the times wherein similar peripheries or arches are run over by bodies impelled by the same *Central force*, are in proportion to their velocities.

The *Central forces* are in a ratio, compounded of the direct ratio of the diameters, and the reciprocal one of the squares of the times, by the entire peripheries.

6. If the times wherein the bodies are carried through the same entire peripheries, or similar arches, be as the diameters of the circles, the *Central forces* are reciprocally as the same diameters.

7. If a body move uniformly in the periphery of a circle, with the velocity it acquires by falling the height AL; the *Central force* will be to the gravity, as double the altitude AL, to the radius CA.—If therefore the gravity of the body be called G, the centrifugal force will be $2AL.G:CA$.

8. If a heavy body move equably in the periphery of a circle, and with the velocity which it acquires by falling the height AL, equal to half the radius; the *Central force* will be equal to the gravity.—And again, if the *Central force* be equal to the gravity, it moves in the periphery of the circle, with the same gravity which it acquires in falling a height equal to half the radius.

9. If the *Central Force* be equal to the gravity, the time it takes up in the entire periphery, is to the time of its fall through half the radius, as the periphery to the radius.

10. If two bodies move in unequal peripheries, and with an unequal velocity, the which is reciprocally in a subduplicate ratio of the diameters; the *Central forces* are in a duplicate ratio of the distances from the center of the forces, taken reciprocally.

11. If two bodies move in unequal peripheries, with celerities which are reciprocally as the diameters; their *Central forces* will be reciprocally as the cubes of their distances from the center of their forces.

12. If the velocities of two bodies moving in unequal peripheries, be reciprocally in a subduplicate ratio of the diameters; the times wherein they pass the whole periphery, or similar arches, are reciprocally in a triplicate ratio of the distances from the center of the forces: wherefore, if the *Central forces* be reciprocally in a duplicate ratio of the distances from the center, the times wherein the entire peripheries, or similar arches, are passed over, are reciprocally in a triplicate ratio of the distances.

13. If a body move in a curve line, in such manner as that the radius CB, Fig. 25. n° 2. drawn from it to the fixed point C, placed in the same plane, describes areas BAC, BCE, &c. proportional to the times, or equal in any given time, it is solicited towards the point C, by a centripetal force.

14. If a body proceed according to the direction of the right line AD, and be solicited by a centripetal force towards a fixed point C, placed in the same plane; it describes a curve, whose cavity is towards C, and whose several areas, comprehended between two radii AB and CB, are proportional to the times.

15. However the *Central forces* differ from one another, they may be compared together; for they are always in a ratio compounded of the ratio of the quantities of matter in the revolving bodies, and the ratio of the distances from the center; and also in an inverse ratio of the squares of the periodical times. If then you multiply the quantity of matter in each body by its distance from the center, and divide the product by the square of the periodical time, the quotients of the division will be to one another in the said compound ratio, that is, as the *Central forces*.

16. When the quantities of matter are equal, the distances themselves must be divided by the squares of the periodical times, to determine the proportion of the *Central forces*: in that case, if the squares of the periodical times be to one another, as the cubes of the distances, the quotients of the divisions, as well as the *Central forces*, will be in an inverse ratio of the squares of the distances.

17. When the force by which a body solicited towards a point is not every where the same, but is either increased or diminished, in proportion to the distance from the center; several curves will thence arise in a certain proportion. If the force decreases, in an inverse ratio of the squares of the distances from that point, the body will describe an ellipsis, which is an oval curve, in which there are two points called *Foci*, and the point towards which the force is directed falls upon one of them; so that in every revolution, the body once approaches to, and once recedes from it. The circle also belongs to that sort of curves, and so in that case the body may also describe a circle. The body may also (by supposing a greater celerity in it) describe the two remaining conic sections, viz. the parabola and hyperbola-curves, which do not return into themselves: on the contrary, if the force increases with the distance, and that in a ratio

ratio of the distance itself, the body will again describe an ellipsis; but the point to which the force is directed is the center of the ellipse; and the body, in each revolution, will twice approach to, and again twice recede from that point. In this case also, a body may move in a circle, for the reason above-mentioned.

CENTRAL Rule, is a rule, or method discovered by our countryman, Thomas Baker, rector of Nympton in Devon, whereby to find the center of a circle designed to cut the parabola in as many points, as an equation to be constructed hath real roots.

Its principal use is in the construction of equations; and he has applied it with good success as far as biquadratics.

The *Central rule* is chiefly founded on this property of the parabola: that if a line be inscribed in that curve perpendicular to any diameter, a rectangle formed of the segments of the inscript is equal to a rectangle made of the intercepted diameter and parameter of the axis.

The *Central rule* has the advantage over Cartes's, and De Lattres's methods of constructing equations, in that both these latter are subject to the trouble of preparing the equation by taking away the second term. This we are freed from in Baker's method, which shews us how to construct all equations not exceeding the fourth power by the intersection of a circle and parabola, without the omission or change of any terms. See *Phil. Transf.* No. 157.

CENTRIFUGAL Force, is that whereby a body revolving round a center, endeavours to recede from it.

It is one of the established laws of nature, that all motion is of it self rectilinear; and that the moving body never recedes from its first right line, till some new impulse be superadded in a different direction: after that new impulse, the motion becomes compounded, but it continues still rectilinear; though the direction of the line be altered. To move in a curve, it must receive a new impulse, and that in a different direction, every moment; a curve not being reducible to right lines, unless infinitely small ones. If then a body continually drawn towards a center, be projected in a line that does not go thro' that center, it will describe a curve; in each point whereof, A (Tab. *Mechanicks*, fig. 25.) it will endeavour to recede from the curve, and proceed in the tangent A D: and, if nothing hindered, it would actually proceed; so as in the same time wherein it describes the arch A E, it would recede the length of the line D E, perpendicular to A D, by its *Centrifugal Force*. The *Centrifugal Force*, therefore, is as the right line D E, perpendicular to A D; supposing the arch A E infinitely small.

The effect of the *Centrifugal Force* is such, that a body, obliged to describe a circle, always describes the largest it possibly can: a greater circle being, as it were, less circular, and less distant from a right line than a small one. A body therefore suffers more violence, and exerts its *Centrifugal Force* more when it describes a little circle, than when a large one: that is, the *Centrifugal Force* is always proportional to the circumference of the curve in which the revolving body is carried round.

It is the same in other curves as in circles; for a curve, whatever it be, may be esteemed as composed of an infinity of arches of infinitely small circles, all described on different radii; so as that it is at those places where the curve has the greatest curvity, that the little arches are most circular: thus, in the same curve, the *Centrifugal Force* of the body that describes it, varies according to the several points wherein it is found.

CENTRIPETAL Force, is that power whereby a moveable body, impelled in the right line A G, (Fig. 25.) is perpetually drawn out of its rectilinear motion, and solicited to proceed in a curve.

The *Centripetal Force*, therefore, is as the right line D E to A B; supposing the arch A E infinitely small. Hence, the *Centripetal* and *Centrifugal* forces are equal.

CENTRO-BARYC Method, in mechanics, is a method of measuring, or determining the quantity of a surface, or a solid, by considering it as formed by motion, and multiplying it into the way of its center of gravity.

The doctrine is comprised in the following theorem, with its corollaries.

Every figure, whether superficial or solid, generated by the motion of a line or a figure, is equal to the factum of the generating magnitude into the way of its center of gravity, or the line which its center of gravity describes.

Demonstr. For suppose the weight of the whole generating magnitude collected in the center of gravity; the whole weight produced by its motion, will be equal to the factum of the weight moved, into the center of gravity. But when lines and figures are considered like homogeneous heavy bodies, their weights are as their bulks: and therefore, the weight moved is the generating magnitude; and the weight produced, that generated.

The figure generated, therefore, is equal to the factum of the magnitude, into the way of its center of gravity. Q. E. D.

Corol. 1. Since a parallelogram A B C D, (Tab. *Mechanicks*, fig. 26.) is described, if the right line A B, proceed according to the direction of another A C, with a motion still parallel to itself; and the way of the center of gravity E, is equal to the

right line E F, perpendicular to C D, that is, to the altitude of the parallelogram: its area is equal to the factum of the base C D, or the describing line into the altitude E F.

Corol. 2. In the same manner it appears, that the solidity of all bodies described by a plane descending according to the direction of any right line A C, is had by multiplying the describing plane by the altitude.

Corol. 3. Since a circle is described, if the radius C L (Fig. 27.) revolve round a center C, and the center of gravity of the radius C L, be in the middle F; the way of the center of gravity is a periphery of a circle X, described by a subduple radius: consequently the area of the circle, is equal to the factum of the radius C L, into the periphery described by the subduple radius C F.

Corol. 4. If a rectangle A B C D, (Tab. *Mechanicks*, fig. 28.) revolve about its axis A D; the rectangle will describe a cylinder, and the side B C the superficies of a cylinder. But the center of gravity of the right line B C, is in the middle F; and the center of gravity of the generating plane in the middle G, of the right line E F. The way of this latter, therefore, is the periphery of a circle described by the radius E G; that of the former, the periphery of a circle described by the radius E F. Wherefore, the superficies of the cylinder is the factum of the altitude B C, into the periphery of a circle described by the radius E F, or the base. And the solidity of the cylinder, is the factum of the generating rectangle A B C D, into the periphery of a circle described by the radius E G, which is subduple of E F, or of the semidiameter of the cylinder.

Suppose, *v. gr.* the altitude of the describing plane, and therefore of the cylinder B C = a ; the semidiameter of the base D C = r ; then will E G = $\frac{1}{2}r$: and supposing the ratio of the semidiameter to the periphery = $1 : m$, the periphery described by the radius $\frac{1}{2}r$ = $\frac{1}{2}m a r$. Therefore, multiplying $\frac{1}{2}m r$ by the area of the rectangle A C = $a r$; the solidity of the cylinder will be = $\frac{1}{2}m a r^2$. But $\frac{1}{2}m a r^2$ = $\frac{1}{2}r . m r . a$ the area of the circle described by the radius D G. It is evident, therefore, the cylinder is equal to the factum of the base into the altitude.

Corol. 5. In like manner, since the center of gravity of the right line A B, (Tab. *Mechanicks*, fig. 17.) is in the middle M, and the surface of a cone is described, if the triangle A B C revolve about its axis; if P M = $\frac{1}{3}C$; the superficies of the cone will be equal to the factum of its side A B, into the periphery described by the radius P M, or the subduple of the semidiameter of the base B C.

Suppose, *v. gr.* B C = r , A B = a ; the ratio of the radius to the periphery $1 : m$; then will P M = $\frac{1}{3}r$, and the periphery described by this radius = $\frac{1}{3}m r$. Therefore, multiplying $\frac{1}{3}m r$ into the side of the cone A B, the product is the superficies of $\frac{1}{3}a m r$. But $\frac{1}{3}a m r$ is also the factum of $\frac{1}{3}a$ and $m r$: therefore, the surface of the cone is the product of the periphery, into half the side.

Corol. 6. If the triangle A C B, (Tab. *Mechanicks*, fig. 29.) revolve about an axis, it describes a cone; but if C B be bisected in D, and the right line A D be drawn, and A O = $\frac{2}{3}A D$; the center of gravity will be in O. The solidity of the cone, therefore, is equal to the factum of the triangle C A B, into the periphery described by the radius P O; but A D : A O :: B D : O P, and A O = $\frac{2}{3}A D$, and D B = $\frac{1}{3}C B$. Therefore, O P = $\frac{1}{3}B D$ = $\frac{1}{3}C B$.

Suppose, *v. gr.* B C = r , A B = a ; the ratio of the radius to the periphery $1 : m$. Then will O P = $\frac{1}{3}r$ the periphery described by this radius $\frac{1}{3}m r$; the triangle A C B = $\frac{1}{2}a r$; and therefore, the solidity of the cone $\frac{1}{3}m r \cdot \frac{1}{2}a r$ = $\frac{1}{6}a m r^2$. But $\frac{1}{6}a m r^2$ = $\frac{1}{6}r . m r \cdot a$. Or, the factum of the base of the cone into the third part of the altitude. See TRIANGLE.

This elegant theorem, which may be ranked among the chief inventions in geometry of the last age, was taken notice of long ago by Pappus; but the jesuit Guldinus was the first who fet it in its full light, and exhibited its use in a variety of examples. Several other geometers, after Guldinus and Pappus, have also used it in measuring solids, and surfaces generated by a rotation round a fixed axis; especially before the late invention of the integral calculus: and it may still take place in some cases, where the integral calculus would be more difficult. M. Leibnitz has observed, that the method will hold, though the axis or center be continually changed during the generative motion.

CENTRUM, in geometry, mechanics, &c. See CENTER.

CENTRUM Phonicum, in acoustics, is the place where the speaker stands in polysyllabical and articulate echoes.

CENTRUM Phoenacampicum, is the place, or object that returns the voice in an echo.

CENTRUM Tendinum, in anatomy, a point, or center, wherein the tails of the muscles of the diaphragm meet.

This center is perforated towards the right side, for the vena cava; towards the left, backward: Its fleshy part gives way to the gula. The descending trunk of the great artery, thoracic duct, and vena azygos, pass between its two inferior processs. See DIAPHRAGM.

C E P

CENTRY Box, a wooden cell, or lodge, made to shelter the centinel, or sentry, from the injuries of the weather. In a fortification, such lodges are usually placed on the flanked angles of the bastions, on those of the shoulder, and sometimes in the middle of the curtain.

CENTUMVIRATE, among the Romans, a court composed of one hundred magistrates, or judges, appointed to decide private differences between the people.

CENTURION, **CENTURIO**, among the Romans, an officer in the infantry, who commanded a *Century*, or an hundred men.

The first *Centurion* of the first cohort of each legion, was called *Primipilus*, or *Primipili Centurio*, sometimes *Primus Centurio*: he was not under the command of any tribune, as all the rest were; and had four *Centuries* under his direction. He guarded the standard, and the eagle of the legion.

CENTURY, a thing divided, or ranged into an hundred parts. At the time when the Roman people were assembled for creating of magistrates, establishing of laws, or deliberating of publick affairs, they were divided into *Centuries*; and to the end their suffrages might be more easily collected, they voted by *Centuries*: this was done in the campus martius; and these assemblies were hence called *Comitia Centuriata*.

The Roman cohorts were distributed into decuries, commanded by decurions; and *Centuries* by centurions. Each cohort consisted of six *Centuries*, and a legion of sixty. See **COHORT**.

CENTURY, in chronology, is the space of one hundred years. Church history is computed chiefly by *Centuries*, commencing from our Saviour's incarnation.

In this sense, we say, the first *Century*; the fathers of the second *Century*; the councils of the third *Century*, &c.

CENTURIES of Magdeburg, a celebrated ecclesiastical history, divided into thirteen *Centuries*, containing thirteen hundred years, ending 'at 1298; compiled by several learned protefants of Magdeburg.

The chief of the *Centuriators*, was Matthias Flacius Illyricus. It is said that Baronius undertook his annals, purely to oppose the *Magdeburg Centuriators*.

CEPHALÆA. See **CEPHALALGIA**.

CEPHALIC*, in medicine, is applied to any thing belonging to the head, or its parts. See **HEAD**.

* The word is Greek κεφαλικος, formed of κεφαλη, caput, head.

CEPHALICS, or **CEPHALIC Medicines**, are such as are proper for disorders of the head.

These are generally of a volatile, spirituous, or aromatic nature, or at least they are joined with such; and are supposed to be of service, by the volatility of their particles insinuating into the nerves, and mixing with the animal spirits directly, as well as by the common circulation. Fixed bodies can only become *Cephalic* by accident.

Thus, spirit of lavender is supposed directly to act upon the nerves of the palate, &c. upon which account, it is frequently taken dropped on sugar, or bread: and sal volatile, by smelling to, is supposed to be assitant to the head, by its volatile particles entering the olfactory nerves. As to aromatic *Cephalics*, as the species of diambra, powder de gutteta, nutmeg, &c. they act chiefly by their aromatic parts warming the nervous system, and increasing their vibrations, by which the nervous fluid circulates more freely.

CEPHALIC Vein, in anatomy, is a vein of the arm between the skin and the muscles, divided into two branches, *External* and *Internal*. The external goes down to the wrist, where it joins the basilica, and turns up to the back of the hand: the internal branch, together with a sprig of the basilica, makes the mediana.—See Tab. Anat. (angeiol.) fig. 6. lit. n.

It is thus called, in regard the antients used to open it in disorders of the head; from a mistaken notion that it had a nearer concern with the head than any of the other veins.

CEPHALALGIA, in medicine, is understood, in the general, of any head-ach; but properly signifies, only a treth one.—When it becomes inveterate, it is called *Cephalæa*; and, when it only possesses half the head, *Hemicrania*.

CEPHALOPHARYNGÆI, in anatomy, two muscles of the orifice of the oesophagus called the *Pharynx*.

They have their origin in the articulation of the head with the first vertebra, and are inserted into the upper part of the pharynx; they serve to draw it upwards and backwards.

CEPHEUS, in astronomy, a constellation of the northern hemisphere; whose stars in Ptolemy's catalogue are thirteen; in Tycho's eleven; in Hevelius's forty; in the Britanic catalogue thirty-five. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

CEPI Corpus, in law, a return made by the sheriff, upon a capias, or other process to the like purpose; signifying, that he hath taken the body of the party.

CERATE*, **CERATUM**, in medicine, a kind of stiff unguent, or liniment, made of oil and wax, with other ingredients; used externally in several diseases, especially those of the skin.

* It takes its name from its capital ingredient, wax, called in Latin *Cera*.

Its consistence is thicker than that of a liniment; the last having usually two ounces of wax to two of oil; but the *Cerate*, four of wax to two of oil: yet it is thinner than a plaster.

There are *Cerates* of various kinds, *refrigerative*, *Emaciac*, &c. *Cerate of Sulphur*, of *Saunders*, *refringent Cerate of Bricks*, *Dvine Cerate*, &c.

There is a particular one, called the *Refrigerative Cerate of Galen*, made of white wax and oleum rolat. omphacin.

CERATION, **CERATIO**, in chymistry, the operation of waxing. See the article.

CERATOGLOSSUM*, *Κερατογλωσσον*, in anatomy, a pair of muscles of the tongue, thus described by Mr. Cowper: "The *Ceratoglossum* has a broad fleshy origination, at the superior part of the os hyoides, laterally; whence it ascends to its insertion, at the root of the tongue. This, with its partner, acting, draw the tongue into the mouth directly: if only one of them act, it moves the tongue on one side."

* The word is derived from the Greek κεραξ, horn, and γλωσσα, tongue; its form bearing some resemblance to a horn.

CERCELE, in heraldry. A *Croci CERCELE*, is a crose, which opening at the ends, turns round both ways, like a ram's horns. See **CROSS**.

CERDONIANS, antient heretics, who maintained most of the errors of Simon Magus, Saturninus, and the Manichees.

They took their name from their leader *Cerdon*, a Syrian, who came to Rome in the time of pope Hyginus; and there abjured his errors: but he did this in appearance only; for he was afterwards convicted of persisting in them, and accordingly was cast out of the church again.

Cerdon asserted two principles, the one good, and the other evil: this last, according to him, was creator of the world, and the God that appeared under the old law. The first, whom he called *unknown*, was the father of Jesus Christ; who, he taught, was only incarnate in appearance, and was not born of a virgin; nor did he suffer death but in appearance. He denied the resurrection, and rejected all the books of the Old Testament, as coming from an evil principle. Marcion, his disciple, succeeded him in his errors. Whence the *Marchionites*.

CER

CEREAIA, in antiquity, feasts of Ceres, instituted by Triptolemus, son of Celeus king of Eleusine in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn, and making bread.

There were two feasts of this kind at Athens; the one called *Eleusinia*, the other *Thesmophoria*.

What both agreed in, and was common to all the *Cerealia*, was, that they were celebrated with a great deal of religion and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters.

It was not Ceres alone that was honoured here, but also Bacchus. The victims offered were hogs, by reason of the waste they make in the products of the earth: whether there was any wine offered, or not, is matter of much debate among the critics. Plautus and Macrobius seem to countenance the negative side; Cato and Virgil the positive. Macrobius says, indeed, they did not offer wine to Ceres; but mulsum, which was a composition of wine and honey boiled up together: and that the sacrifice made on the 21st of December to that goddess and Hercules, was a pregnant sow, together with cakes and mulsum: and that this is what Virgil means by *Miti Baccho*. *Vide* Salmastius, Lambin, &c.

The *Cerealia* passed from the Greeks to the Romans, who held them for eight days successively: commencing, as generally held, on the fifth of the ides of April. It was the women alone who were concerned in the celebration, all dressed in white: the men, likewise in white, were only spectators. They eat nothing till after sun-set; in memory of Ceres, who in her search after her daughter, took no repast but in the evening.

After the battle of Cannæ, the desolation was so great at Rome, that there were no women to celebrate this feast, by reason they were all in mourning; so that it was omitted that year.

CEREBELLUM, or **CEREBEL**, in anatomy, the hinder part of the brain.—See *Tab. Anat.* (osteol.) fig. 5. litt. cc.

The *Cerebellum* is esteemed a kind of little brain by itself, as the word imports, which is a diminutive of *Cerebrum*.

It is placed in the hinder and lower part of the skull, underneath the hind part of the brain, or cerebrum: it lies open to the cerebrum at bottom; but at top it is separated from it by a duplicature of the dura mater. Its figure somewhat resembles a flat bowl, broader than it's long.

Its substance is harder, drier, and more solid than that of the brain, but of the same nature and kind; being composed like it, of a cortical, or glandulous; and a medullary part: the branches of which last, when opened, resemble those of a tree, meeting in the middle, and forming a kind of stem, which runs quite through it. Its colour is yellowish, that of the brain being whiter.

Its surface is unequal, and furrowed, but not so much as that of the cerebrum; appearing rather as if laminated, like some shells; the middle circles being the largest and deepest: between the laminæ are duplicatures of the pia mater. The fore and hind parts of the *Cerebellum* are terminated by apophyses, called *Vermiformes*, from the resemblance they bear to worms: it is joined to the medulla oblongata by two processes, called by Willis, *Pedunculi*.

Besides these, there are two or three other medullary processes, which passing across the medulla oblongata, form an arch; from the discoverer called *Pons Varoli*.

The blood-vessels of the *Cerebellum* are the same with those of the cerebrum; and the use the same, viz. to separate the nervous juice from the blood, and convey it through the several parts of the body.

Dr. Willis, however, distinguishes between the functions of the *Cerebrum*, and *Cerebellum*; making the first the principle of voluntary motions, and actions; and the last the principle of involuntary ones, viz. that of respiration, the motion of the heart, &c.

It is commonly asserted, that a wound either in the cortex, or medulla of the *Cerebellum*, is mortal; which it is not in the brain, from which there have been entire parts taken away without harm. The truth is, we have instances of people living some time not only without any cerebrum, but also without any *Cerebellum*.

CEREBRUM, in anatomy, the brain, properly so called; in contra-distinction from the *Cerebellum*. See **BRAIN**.

CEREMONY*, an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn.

* The word comes from the Latin *Ceremonia*, quasi *Cerevis munia*, on account of the great number of ceremonies used in making the offerings to Ceres: or by reason the first religious ceremonies were those of Ceres: hence Cicero calls *Cereres antiquissimam, religiosissimam principem omnium sacrorum, quæ apud omnes gentes fuit*. Valerius Maximus derives it from *Cere* and *Munia*: *Cere* was a little town near Rome, where the Romans made offerings to the gods, with uncommon ardor and officiousness, on occasion of the fear they were in of the Gauls, who then lay before Rome. Others deduce it from *Cereus*, an ancient Latin word, which signifies holy or sacred: some from the Greek *χαίρειν*, to rejoice.

CER

CERINTHIANs, antient heretics, who denied the deity of Jesus Christ.—They took their name from Cerinthus, one of the first heresiarchs in the church, being cotemporary with St. John.

Cerinthus was a zealous defender of the circumcision, as well as the Nazarenes and Ebionites. St. Epiphanius says, he was the head of a faction which rose at Jerusalem against St. Peter, on account of some uncircumcised persons with whom that apostle had eat. He believed that Jesus Christ was a mere man, born of Joseph and Mary; but that in his baptism, a celestial virtue descended on him in form of a dove; by means whereof he was consecrated by the holy Spirit, and made Christ. It was by means of this celestial virtue, therefore, that he wrought so many miracles; which, as he received it from heaven, quitted him after his passion, and returned to the place whence it came: so that Jesus, whom he called *pure man*, really died and rose again; but that Christ, who was distinguished from Jesus, did not suffer at all.

Some authors ascribe the book of the *Apocalypse* to Cerinthus; adding, that he put it off under the name of St. John, the better to authorize his reveries touching Christ's reign in the flesh: and it is even certain he published some works of this kind, under the title of *Apocalypses*.

St. Epiphanius observes, that when a *Cerinthian* died without baptism, another person was baptized in his stead.

They received the gospel of St. Matthew, to countenance their doctrine of circumcision, from Christ's being circumcised; but they omitted the genealogy. And they discarded the epistles of St. Paul, because that apostle held circumcision abolished.

CEROMA, originally denoted a mixture of oil and wax, with which the ancient wrestlers rubbed themselves, not only to make their limbs more sleek, and less capable of being laid hold of, but more pliable, and fit for exercise.

CERTIFICATE, a testimony given in writing, to assure and notify the truth of any thing to a court of justice, or the like. See **TESTIMONIAL**.

CERTITUDE, is properly a quality of the judgment, importing an adhesion of the mind to the proposition we affirm; or the strength wherewith we adhere to it.

Certitude is of the same nature with the evidence that produces it: the evidence is in the things that the mind sees and considers, i. e. in the ideas: *Certitude* is in the judgment the mind makes of those ideas.

The schoolmen distinguish two kinds of *Certitude*: the one of *Speculation*, arising from the evidence of the thing; the other of *Adhesion*, which arises from the importance thereof: this last they apply to matters of faith.

Further, the schools distinguish three other kinds of *Certitude*, with regard to the three different kinds of evidence whence they arise.

Metaphysical CERTITUDE, is that arising from a metaphysical evidence: such is that a geometrician has of the truth of this proposition, "That the three angles of a triangle are equal to two right ones."

Physical CERTITUDE, is that arising from physical evidence: such is that a man has that there is fire on his hand, when he feels it blaze, and feels it burn.

Moral CERTITUDE, is that founded on moral evidence: such is that a person has, that he has got, or lost a cause, when his attorney and friends send him an express notice of it, or a copy of the judgment, &c.

Moral Certitude, is frequently equivalent to metaphysical *Certitude*. Thus a criminal who hears the sentence read frequently makes no doubt either of his condemnation or execution; and yet has nothing, here, beyond a moral *Certitude*; for, metaphysical *Certitude* he has none: neither has he any physical *Certitude*, except as to what relates to the reading of the sentence, and the action of the executioner when he takes him into his possession.

In the *Philosophical Transactions*, we have an algebraic calculation of the degrees of moral *certitude*, arising from human testimony in all its cases; whether immediate, mediate, concurring, oral, or written.

The author thereof shews, that if the report pass through several reporters hands ere it arrive, each conveying $\frac{1}{2}$ of *Certitude*, after 12 transmissions, it will only be an equal lay, whether it be true or not: if the proportion of *Certitude* be fixed at $\frac{1}{100}$, it will come to half from the 70th hand; if at $\frac{1}{1000}$, from the 695th hand.

For concurring evidences, if two reporters have each $\frac{1}{2}$ of certainty, they will both give an assurance of $\frac{3}{4}$, or of 35 to 1; if three, of $\frac{7}{8}$; and the co-attestation of 10 would give $\frac{1023}{1024}$ of certainty; that of a 20th, $\frac{1048575}{1048576}$. He shews, farther, that if there be six particulars in a narrative, all equally remarkable; and that he to whom the report is given has $\frac{1}{2}$ of *Certitude* for the whole; there is 35 to 1 against the failure in any one certain particular.

He proceeds to compute the certainty of tradition, both oral and written, in whole and part; successively transmitted, and also co-attested by several successors of transmittents.

CERT-MONEY, *Head-money*, a common fine, paid yearly by the tenants of several manors to the lords thereof; and sometimes to the hundred, *pro Certo Lata*, for the certain keeping of the leet.—This, in ancient records, is called *Certum Lata*.

CERVICAL * *Nerves*, are seven pair of nerves, so called, as having their origin in the *Cervix*, or neck.—See *Tab. Anat.* (osteol.) fig. 6. lit. dd.

* They are thus called from the Latin *Cervix*, neck.

The first pair arises between the first and second vertebrae of the neck; and contrary to the rest, comes out before and behind: whereas the other six pair come out laterally from the junctures of the vertebrae, through particular perforations: this first pair goes to the muscles of the head and ear. The second pair, according to Dr. Willis, contributes the main branch towards the formation of the diaphragmatic nerves; which, according to Vieussens, spring only from the fourth and sixth pair. The three last pair, joining with the two first of the dorsum, or thorax, make the brachial nerves. All the *Cervical Nerves* send innumerable branches to the muscles, and other parts of the head, neck, and shoulders.

CERVICAL Vessels, among anatomists, denote the arteries, veins, &c. which pass through the vertebrae and muscles of the neck, up to the skull.

CERVICALES *Defendentes*, a pair of muscles, antagonists to the sacro-lumbares; coming from the third, fourth, fifth, and sixth vertebra of the neck.

Most authors reckon these, though improperly, a production and part of the sacro-lumbus.

CERVIX, in anatomy, properly denotes the hind part of the neck; as contra-distinguished from the fore-part, which is called *Jugulum*, or the throat.

CERVIX of the Uterus, the neck of the uterus, or that oblong canal, or passage between the internal and external orifices, and which receives and incloses the penis like a sheath, whence it is also called *Vagina*. See *UTERUS*, and *VAGINA*.

The *Cervix Uteri*, in maids, is very narrow, except in the time of the menses; scarce wide enough to admit a goose's quill: its inner extremity is called the *Osculum Internum*, which is kept sealed up with a kind of glutinous matter, issuing from the glands about it.

CERUMEN, a thick, viscous, bitter excrementitious humour, separated from the blood by proper glands placed in the meatus auditorius, or outer passage of the ear.

This is also called *Cerumen aurium*, in English, *Ear-wax*. See *EAR*.

CERUSSE, or *CERUSE*, a white calx of lead, used in painting, and cosmetics; made by calcining that metal, in the vapour of vinegar.

Cerusse is made of thin laminæ, or plates of lead, made up into rolls, and so placed as to receive and imbibe the fumes of vinegar, contained in a vessel set over a moderate fire.

The laminæ are, by means hereof, converted into a white rust; which they gather together, and grinding it up with water, form it into little cakes. Cardan shews how to make a sort of *Cerusse* of tin and urine.

Cerusse makes a beautiful white colour, and is much used by the painters, both in oil and water colours. It makes the principal ingredient in the focus used by the ladies for the complexion. Taken inwardly, it is a dangerous poison; it soon shews its malignity, spoiling the breath and teeth, and hastening wrinkles, and all the symptoms of old age.

The best *Cerusse*, is that of Venice; but this is rare: that chiefly used, is either English or Dutch, both of which have more chalk in them than white lead; the latter, however, is the better of the two.—Fallopian speaks of a native *Cerusse*, but every body else knows it to be factitious.

CESAR. See the article *CÆSAR*.

CESARIAN Section. See *CÆSARIAN Section*.

CESSAVER, a writ which lies in divers cases; upon this general ground, that he against whom it is brought, has for two years ceased or neglected to perform such service, or pay such rent, as he is obliged to by his tenure; and has not upon his lands or tenements sufficient goods or chattels to be distrained.

A *Cessavit* only lies for annual service, rent, and such like, not for homage or fealty.—The forms and species of *Cessavit* are various; as *Cessavit de Cantaria*, *Cessavit de Feodifirma*, *Cessavit per Biennium*.

CESSION, in a legal sense, an act whereby a person surrenders up, and transmits to another person, a right which belonged to himself.

Cession is a general term, the species whereof are, a *Surrender*, *Relinquishment*, *Transfer*, and *Subrogation*; which see.

Cession is particularly used in the civil law, for a voluntary and legal surrender of a person's effects to his creditors, to avoid imprisonment.

This practice still obtains in France, and other countries; and is done by virtue of letters patent granted in favour of the poor and honest. The *Cession* originally carried with it a mark of infamy, and obliged the person to wear a green cap, or bonnet;

at Lucca an orange one: to neglect this, was to forfeit the privileges of the *Cession*. This was originally intended to signify, that the *Cessionary* was become poor through his own folly.

The Italian lawyers describe the ceremony of *Cession* to consist in striking the bare breech three times against a stone, called *Lapis Vituperii*, in the presence of the judge. Formerly it consisted in giving up the girdles and keys in court; the antients using to carry at their girdles the chief utensils wherewith they got their living; as the scrivener his escritore, the merchant his bag, &c.

The form of *Cession* among the antient Romans and Gauls was as follows. The *Cessionary* gathered up dust in his left hand, from the four corners of the house, and standing on the threshold, holding the door-post in his right hand, threw the dust back over his shoulders, then stripping into his shirt, and quitting his girdle and bags, he jumped with a pole over a hedge; hereby letting the world know, that he had nothing left, and that when he jumped, all he was worth was in the air with him.

This was the *Cession* in criminal matters: in civil cases, it was sufficient to lay a broom, switch, or broken straw on the threshold. This was called *Chrencruda per durpillum & festucam*.

CESSION, in the ecclesiastical law, is one manner of vacating or voiding an ecclesiastical benefice.

Cession is an implicit kind of resignation, understood where a person does some act, or takes on himself some charge, which is inconsistent with his holding the benefice he was before possessed of.

By the statute, if a clerk have one benefice of 8*l.* per annum value, and takes another, of what value soever, with cure of souls, and without dispensation, the former living is, *ipso facto*, void: and this kind of avoidance of a living is called *Cession*.

What is called by *Cession* in other benefices, is called by *Creation* in relation to a bishoprick; for if an incumbent be made a bishop, his benefice is said to be void by *creation*.

CESSIONARY, a *Bankrupt*.

CESSOR, in law, one dilatory, and delinquent in his duty, or service, and who thereby incurs the danger of the law, and is liable to have the writ *Cessavit* brought against him.

Where it is said the tenant *cesseth*, it is meant he ceaseth to do his duty, or service to which he is bound.

CESTUI, a French term, literally signifying *He, or Him*, frequently used in our old law-writings. Thus,

Cestui qui Trust, is he who has lands in trust, &c. committed to him for the benefit of another.

Cestui qui Vie, one for whose life any lands or tenements are granted.

Cestui qui Use, he to whose use another man is infeoffed in lands or tenements.

CESTUS*, among antient poets, a fine embroidered girdle worn by Venus, endowed with a faculty of charming and conciliating love.

* The word is also written *Cestum*, and *Ceston*: It comes from the Greek *αἰσθῆ*, a *Girdle*, or other thing embroidered, or wrought with the needle: whence also *Incensur*; a term used at first for any nagbines by adorning the girdle, &c. but now restrained to that between persons near akin. See *INCENSUR*.

CESTUS, or *CÆSTUS*, was also a large leathern gantlet, garnished with lead, used in the combats or exercises of the antient Athletæ. See *CÆSTUS*.

CESURE, or *CÆSURA*, in poetry. See *CÆSURA*.

CETACEOUS*, in natural history, a term applied to all large sea fishes, and beasts, which bear a resemblance to the whale. See *FISH* and *WHALE*.

* The word is formed of the Latin *Cetus*, whale.

The horn usually called the *Unicorn's Horn*, is found to be the tooth of a Cetaceous fish in the icy sea, called *Narval*. See *Supplement*, article *CETACEOUS*.

CETERIS Paribus. See *CÆTERIS Paribus*.

CETUS, in astronomy, the *Whale*; a large constellation of the northern hemisphere, under Pices, and next the water of Aquarius.

The stars in the constellation *Cetus*, in Ptolemy's catalogue are twenty-two; in Tycho's twenty-one; in Hevelius's twenty-two; in the Britannic catalogue seventy-eight. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

CHACE, } See CHASING.
CHACING, }

CHACCOON*, or CHACONE, a kind of dance, in manner of a faraband, borrowed from the Spaniards, and by them from the Moors. The bass always consists of four notes, which proceed in conjunct degrees: and whereon they make divers concords and complements, with the same burden.

* The word is formed of the Spanish *Chacona*; not as others pretend from the Italian *Cacona*, a blind man, the inventor.

CHAFE-Wax, or CHAUFEE-Wax, an officer in chancery, whose business is to fit the wax for the sealing of writs, patents, and other instruments issued thence.

CHAGREEN, or CHAGRIN, in commerce. See the article SHAGREEN.

CHAIN, CATENA, a series of several rings, or links, fitted into one another.

There are *Chains* of divers matters, sizes, and forms, and for divers uses.—Ports, rivers, streets, &c. are closed with iron *Chains*: rebellious cities are punished by taking away their *Chains*, and barriers.

The arms of the kingdom of Navarre are, *Chains Or, in a field Gules*. The occasion hereof is referred to the kings of Spain leagued against the Moors; who having gained a celebrated victory against them in 1212, in the distribution of the spoils, the magnificent tent of Miralumin fell to the king of Navarre; as being the first that broke and forced the *Chains* thereof.

A *Gold CHAIN*, is one of the ornaments or badges of the dignity of a lord-mayor of London; and remains to the person, after his being divested of that magistrature, as a mark that he has passed the *Chair*.

Something like this, Chorier observes, obtained among the ancient Gauls: the principal ornament of their people in power and authority was a gold *Chain*, which they wore on all occasions; and even in battle to distinguish them from the common soldiers. *Hist. de Dauph. Lib. III. p. 130.*

CHAIN also denotes a kind of string, of twisted wire; serving to hang watches, tweezer-cases, and other valuable toys upon.

The invention of this piece of curious work was owing to the English; whence, in foreign countries, it is denominated the *English Chain*. It was some time before foreigners undertook to imitate them, and at last with no extraordinary success: those of Paris have come nearest. These *Chains* were at first usually either of silver or gold, some of gilt copper; the thread, or wire of each kind must be very fine.

For the *Fabric, or making of these CHAINS*; a part of the wire is folded into little links of an oval form; the longest diameter about three lines; the shortest, one. These, after they have been exactly folded, are again folded into two; and then bound together, or interwove, by means of several other little threads of the same thickness; some whereof, which pass from one end to the other, imitate the warp of a stuff; and the others, which pass transverse, the woof. There are at least four thousand little links in a *Chain* of four pendants; which are, by this means, bound so equally, and withal so firmly together, that the eye is deceived, and takes the whole to consist of one entire piece.

CHAIN-Pump. See Pump, and BUR-Pump.

CHAIN-Shot, in war, two bullets, or rather half-bullets, linked together by a *Chain*: their use at sea is to shoot down yards, or masts; or to cut the shrouds, or any other rigging of a ship.

CHAIN, in surveying, is a measure consisting of a certain number of links of iron wire, usually 100; serving to take the dimensions of fields, &c. by. See MEASURE, and SURVEYING.

This is what *Merienne* takes to be the arripendium of the ancients.

The *Chain* is of various dimensions, as the length or number of links varies: that commonly used in measuring land, called *Gunter's Chain*, is in length four poles, or perches; or sixty-fix feet, or a hundred links; each link being seven inches $\frac{2}{3}$.

That ordinarily used for large distances, is in length 100 feet; each link one foot.

For small parcels, as gardens, &c. is sometimes used a small *Chain* of one pole, or sixteen foot and a half length; each link one inch $\frac{2}{3}$.

Some, in lieu of *Chains* use ropes; but these are liable to several irregularities; both from the different degrees of moisture, and of the force which stretches them. *Schwenkerus*, in his practical geometry, tells us, he has observed a rope sixteen foot long, reduced to fifteen in an hour's time, by the mere falling of a hoar frost. To obviate these inconveniences, *Wolffius* directs, that the little strands whereof the rope consists, be twisted contrary ways, and the rope dipped in boiling hot oil, and when dry, drawn through melted wax. A rope thus prepared, will not get or lose any thing in length, even though kept under water all day.

Use of the CHAIN in surveying.—The manner of applying the *Chain* in measuring lengths is too popular to need description. In entering down the dimensions taken by the *Chain*, the *Chains* and links are separated by a dot: thus a line sixty-three *Chains* fifty-five links long, is wrote 63.55. If the links be short of 10, a cypher is prefixed; thus 10 *Chains*, 8 links, are wrote 10.08.

To find the area of a field, &c. the dimensions whereof are given in *CHAINS* and *links*. 1st, Multiply the lines by one another, according to the rules given under AREA; and from the product cut off five figures towards the right; those remaining on the left will be acres. 2dly, Multiply the five figures cut off by four; and cutting off five again from the product on the right, those remaining on the left will be rods. Lastly, Multiply the five thus cut off by forty; and cutting off five, as before, on the right, those remaining on the left are square perches.

To take an angle DAE, (Tab. Surveying, fig. 1.) by the *Chain*: measure a small distance from the vertex A along each leg, viz. to d and e; then measure the distance d e: to lay this down, draw

draw A E at pleasure, and from your scale set off the distance measured on it. See SCALE.

Then, taking in your compasses the length measured on the other side, on the vertex A, as a center, describe an arch *d e*; and on the point *c*, as a center, with the measured distance of *c d*, describe another arch *a b*. Through the point where this intersects the former arch, draw a line A D. So is the angle plotted; and its quantity, if required, may be measured on a line of chords. See CHORD.

To take the plan or plot of any place, as A B C D E, (fig. 2.) by the Chain. Draw a rough sketch of the place by eye; and measuring the several sides A B, B C, C D, D E, enter down the lengths on the respective lines: then if the plan be to be taken within side of the place, instead of measuring the angles, as before, measure the diagonals A D, B D. Thus will the figure be reduced into three triangles, whose sides are all known, as in the former case; and may be laid down on paper, according to the method above.

If the plan be to be taken without side the place, the angles must be taken thus; *v. g.* for the angle B C D, produce the lines B C and C D to any certain equal distance, *v. g.* to *a* and *b*, five Chains; and measure the distance of *a b*. Thus have you an isosceles triangle C a b, wherein the angle *a C b* = B C D its opposite one is had: thus is the quantity of B C D found, and the angle laid down as before.

By the Chain to find the distance between two objects inaccessible in respect of each other. From some place, as C, (fig. 3.) whence the common distance to each object A and B, is accessible in a right line; measure the distance C A, which suppose fifty Chains; and continue the line to D, *viz.* fifty more: measure also B C, which suppose thirty Chains; and produce the line to E, *viz.* thirty more. Thus will be formed the triangle C D E, equal and similar to the triangle A B C; consequently the distance D E, being measured, will give the inaccessible distance required.

By the Chain to find the distance of an inaccessible object, *v. g.* the breadth of a river. On one side place a pole, four or five foot high, perpendicularly, having a slit a-top, with a frail piece of wire, or the like, two or three inches long, put through the same. This is to be slipped up or down, till, looking along it, you find it point full on the other side of the river; then turning the pole with the wire in the same direction, observe the point on the dry land, to which it points when looked along as before: measure the distance from the pole to this last point; it is the same with that of the first required.

CHAIR, CATHEDRA, was antiently used for the pulpit, or suggestion, whence the priest spoke to the people.

It is still applied to the place whence professors and regents in universities deliver their lectures, and teach the sciences to their pupils: Thus, we say, the professor's Chair, the doctor's Chair, &c.

Curule CHAIR, was an ivory seat placed on a carr, wherein were seated the prime magistrates of Rome, and those to whom the honour of a triumph had been granted.

CHAIR is also applied by the Romanists to certain feasts, held antiently in commemoration of the translation of the see, or seat of the vicarage of Christ, by St. Peter.

The *perforated Chair*, wherein the new elected pope is placed, F. Mabillon observes, is to be seen at Rome: but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but says there is a mystery in it; and it is intended, forsooth, to explain to the pope those words of scripture, that *God draws the poor from out of the dust and mire*.

CHAIR-MAN, the president, or speaker of an assembly, company, &c. See PRESIDENT, &c.

We say, the *Chair-Man* of a committee, &c.

CHAISE, a sort of light open chariot, or calash.

CHALASTIC Medicines,* are such as have the faculty of relaxing the parts; when, on account of their extraordinary tension, or swelling, they occasion pain.

* The word comes from the Greek χαλασ, *I loosen, relax*.

Of this kind are butter, and many oils, &c.

CHALAZA, among naturalists, a white knotty kind of string at each end of an egg, formed of a plexus of the fibres of the membranes whereby the yolk and white are connected together. See EGG.

Its use, according to Harvey, is to be as it were the poles of this microcosm, and the connection of all the membranes twisted and knit together; whereby the liquors are not only conserved, each in its place, but also in its due position to the rest.

Mr. Derham adds, that they also serve to keep one and the same part of the yolk uppermost, let the egg be turned which way it will; which is done by the following mechanism: the *Chalazæ* are specifically heavier than the whites wherein they swim; and being braced to the membrane of the yolk, a little out of the axis, they cause one side of the yolk to be heavier than the other. The yolk being thus by the *Chalazæ* made buoyant, and kept swimming in the midst of two whites, is by its own heavy

side kept with the same side always uppermost: which uppermost side he imagines to be that whereon the Cicatricula lies.

CHALCANTHUM, χαλκανθος, the same with vitriol. See VITRIOL.

Some have also used *Chalcantum* corruptly for colcothar, or vitriol rubified.

CHALCEDONY, or CALCEDONY. See the article CALCEDONY.

CHALCIDIC, CHALCIDICUM, or CHALCEDONIUM,* in the antient architecture, a large magnificent hall belonging to a tribunal, or court of justice.

* Festus says, it took its name from the city Chalcis; but he does not give the reason. Philander will have it to be the court, or tribunal, where affairs of money and coinage were regulated; so called from χαλκός, *Braze*, and δίκη, *Justice*. Others say, the money was struck in it; and derive the word from χαλκός, and οἶκος, *House*.

In Vitruvius, it is used for the auditory of a basilica: in other of the antient writers, for a hall, or apartment, where the heathens imagined their gods to eat. See BASILICA.

CHALCITIS, a kind of vitriolic mineral, reddish like copper, friable, and having yellow shining veins within.

It has the taste of the blue vitriol of copper, and dissolves very easily in aqueous liquors. There are two other minerals, called *Misti* and *Sory*, very much like the *Chalcitis*. In effect, the antients contounded them together; and not only the *misti* and *sory*, but also the *melanteria*; or rather, they imagined a successive transmutation of the four minerals, which began with *Chalcitis*, then became *misti*, then *melanteria*, and lastly *sory*, where it fixed.

The moderns make these four distinct matters; though the chief difference between them, is supposed to lie in the different tenuity or grossness of their substance.

Some say, the *misti* is formed on the *Chalcitis*, as verdigrise on copper, being properly its rust; and that *Chalcitis* is formed in the same manner on the *sory*.

This is certain, they are all found in copper mines: but the modern druggists know little of any of them.

The *Chalcitis* is brought from Germany: it is very caustic and escharotic. Its chief use is in the composition of venice-treacle: in lieu of it are frequently substituted *chalcantum rubified*, or *copperas*. See Supplement, articles CHALCITIS, MISTY, SORY, and MELANTERIA.

CHALCOGRAPHY, the art of engraving on copper and brasse. See ENGRAVING.

CHALDEE, or CHALDAIC, Language, that spoke by the Chaldeans, or people of Chaldaea.

The *Chaldee* is a dialect of the Hebrew.

CHALDEE Paraphrase, in the rabbinical style, is called Targum. See TARGUM.

There are three *Chaldee* paraphrases in Walton's polyglot; *viz.* that of Onkelos, that of Jonathan son of Uziel, and that of Jerusalem.

CHALDRON, CHALDER, or CHAUDRON of coals, a dry English measure, consisting of thirty-six bushels heaped up, according to the sealed bushel kept at Guild-hall, London.

The *Chaldron* should weigh two thousand pounds.—On ship-board, twenty-one *Chaldrons* of coals are allowed to the score. See COAL.

CHALICE, the cup, or vessel used to administer the wine in, in the eucharist; and, by the Romanists, in the mass.

Bede affirms, that the *Chalice*, used by Jesus Christ at the supper, had two handles, and held just half a pint; which the antients imitated. In the primitive times the *Chalices* were of wood: pope Zephyrine first appointed them to be of silver, and gold; though others ascribe this to Urban I. Leo IV. forbid tin and glass; as did likewise the council of Calcyth in England: Horn Lindanus, and Beatus Rhenanus, who had seen some of the antient *Chalices* in Germany, observe, that they had a pipe, or tube, fitted artfully to them, through which the people sucked, instead of drinking.

CHALK, a white fossil substance, usually reckoned as a stone; but Dr. Sars thinks, without reason, since, when examined by the hydrostatical balance, it is found to want much of the weight and consistence of a real stone: so that he thinks it more justly ranked among the earths.

This he observes to be the case, not only in *Chalk*, but various other bodies, taken for granted to be stones; some whereof are nearer to earth than stone; others nothing but chalk, sulphur, metal, &c.

Chalk is of two sorts; the first, a hard, dry, strong *Chalk*, used for making of lime. The other a soft, unctuous *Chalk*, used to manure lands; as easily dissolving with rain and soft: It is best for cold, four ground, and promotes the yielding of corn; it sweetens grass so as to cause cattle to fatten speedily, and cows to give thick milk.

Chalk is also used in medicine, as an astringent, an absorbent, and a sweetener; and is celebrated for curing the heart-burn, beyond anything whatsoever. See Supplement, article CRETACEA.

CHA

CHALLENGE*, a cartel, or invitation to duel, or other combat. See **DUEL**.

* The word *Challenge* was antiently latine *Calumnia*.

CHALLENGE, in law, is an exception made to jurors who are returned to pass on a trial.

Challenge to the jurors, is either made to the array, or to the poll: to the array, as when the whole number is excepted against, as partially empannelled. To the poll, as when particulars are excepted against, as not indifferent.

Challenge to the jurors, is also divided into *Challenge Principal*, and *Challenge per Cause*; i. e. upon cause or reason alleged.

Challenge Principal, otherwise called *Challenge Peremptory*, is what the law allows without cause alleged, or further examination: thus a prisoner at the bar, arraigned on felony, may peremptorily challenge twenty, one after another, alleging no cause but his own dislike; and they will be set aside, and new ones chosen in their room. In case of high-treason, no *Challenge peremptory* was formerly allowed; but by Stat. 7. Gul. III. liberty is given peremptorily to challenge thirty-five.

Yet there seems to be a difference between *Challenge principal* and *Challenge peremptory*; the latter being only in matters criminal, and without any cause alleged; the former mostly in civil cases, and with assigning some such cause, as being found true, the law allows; v. g. if either party alleges, that one of the jurors is the son, brother, cousin, or tenant of the other, the exception is good. Also in the plea of the death of a man, or in any action real or personal, where the debt or damages amount to forty shillings, it is a good *Challenge* to a juror, that he cannot dispend forty shillings per annum of freehold.

Challenge upon Reason or Cause, is when the party does allege some such exception as is sufficient upon acknowledgment of the truth of it; v. g. if the son of the juror have married the daughter of the other party, or the like.

CHALLENGE, in hunting. When hounds at first finding the scent of their game, presently open, and cry, the huntmen say, *they challenge*.

CHALYBEAT, in medicine, something that partakes of the nature of steel, or iron; or that is impregnated with particles of those metals.

Chalybeats act chiefly as absorbents, and deobstruents. Iron, M. Lemery observes, is a mixture of an oily substance with a metallic matter; but the oil is predominant in the mixture: and between the parts mixed are large pores. Hence, Iron becomes easily dissolvable; and its oil easily disengages itself, but when once decomposed, i. e. when once the oil is separated from the pure, ferruginous, or metallic part, no dissolvent has any effect on the caput mortuum.

Hence appears the absurdity of that common practice, of calcining iron to such a degree, as to convert it into what the chymists call a *Crocus*, or saffron. This operation must of necessity take away all, or most of the oily substance, and leave nothing but the indissoluble caput mortuum. The oil here separated should properly have been separated by the heat of the stomach; whence, according to Mr. Lemery, it would have carried into the blood a new spirituous, salutary juice: he observes also, that iron acts as an absorbent, from the largeness of its pores, and the ease wherewith all kinds of salts, even gross ones, insinuate themselves into them: even scorbutic acids are absorbed thereby. Further, it is not all that peccant acids enter iron; but in entering they also expel and express that salutary juice, which is also put in motion, and disposed to be evacuated by the natural heat. Thus is iron doubly advantageous, both by the oil it furnishes the blood withal, and by the salts it frees it from. The action of the particles of a *Chalybeat*, by their elasticity, together with the momentum they give the blood by their ponderosity, make it not only preferable to most other deobstruents, but also proper in other cases; especially where there is a viscosity of the juices; the blood depauperated, and where the circulation is languid; as in most hectic and hypochondriac cases.

CHAM, or KHAN*, the title given to the sovereign princes of Tartary.

* The word, in the Persian signifies, *mighty lord*, in the Slavonic, *emperor*. Sperlingius, in his dissertation on the Danish term of majesty, *konig*, king, thinks the Tartarian *Cham* may be well derived from it; adding, that in the north they say *Kan, Kennen, Konge, Konning*, &c.

The term *Cham*, is also applied among the Persians, to the great lords of the court, and the governors of provinces.

CHAMADE*, in war, a certain beat of a drum, or sound of a trumpet, which is given the enemy as a signal, to inform them of some proposition to be made to the commander; either to capitulate, to have leave to bury their dead, make a truce, or the like.

* Menage derives the word from the Italian *Chiamata*, of *clamare*, to cry.

CHAMBER*, in building, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in; and called by the latins *Cubiculum*.

* The word comes from the Latin *Camera*; and that, according

CHA

to *Nicod*, from the Greek *καμαρα*, *Vault*, or *Cave*; the term *Chamber* being originally confined to places arched over.

A compleat apartment is to consist of a hall, antichamber, *Chamber*, and cabinet.

Bed-CHAMBER. See the article **BED-CHAMBER**.

Privy-CHAMBER.—*Gentlemen of the Privy-CHAMBER* are servants of the king, who are to wait and attend on him and the queen at court, and in their diversions, progresses, &c. Six of these are appointed by the lord chamberlain, together with a peer, and the master of the ceremonies, to attend all ambassadors from crowned heads in their public entries. Their number is forty-eight.

Their institution is owing to king Henry VII. As a singular mark of favour, they are empowered to execute the king's verbal command, and without producing any written order; their person and character being deemed sufficient authority.

CHAMBER in Policy, is used for the place where certain assemblies are held; also, for the assemblies themselves.

Of these there are various kinds; some established for the administration of justice, others for matters of commerce, &c.

Of the first kind among us are the

Star-CHAMBER, *Camera Stellata*, or *Chambre de Esloils*, so called because the roof was originally painted with stars: This is of an antient standing, but its authority was very much heightened by Henry VII. and Henry VIII. who appointed, by two several statutes, that the chancellor, assisted by others there named, should have power to hear complaints against retainers, embracers, misdemeanors of officers, and other like offences, which through the power and authority of those who committed them did lift up the head above other faults; and for which inferior judges were not so meet to give correction, and the common law had not sufficiently provided.

By the statute 17 Car. I. the court called *Star-chamber*, and all jurisdiction, power, and authority thereto belonging, are, from August the first, 1641, absolutely dissolved.

Imperial CHAMBER, is a court or jurisdiction held antiently at Spire, but since transferred to Wertlar; in which are determined the differences arising among the princes and cities of the empire.

It was at first ambulatory: In 1473 it was fixed to Augsburg, then removed to Frankfurt; and thence to Worms, in 1497: afterwards it was removed to Nuremberg and Ratibon; again to Worms and Nuremberg; and from this last to Eslingen; thence, in 1527, to Spire; where Charles V. rendered it sedentary, in 1530.

At its first institution it consisted of sixteen assessors; but the reformation ensuing, occasioned the number to be increased: by the treaty of Olmaburg, in 1648, there were appointed fifty assessors; whereof twenty-four were to be protestants, and twenty-six catholics; besides five presidents, two of them protestants, the rest catholics.

As the princes or circles of the empire are not always exact in filling up the vacancies in this *Chamber*, the number of assessors is now reduced to sixteen.

This *Chamber* has a right of judging by appeal, and is the last resort, of all civil affairs of all the states and subjects of the empire, in the same manner as the Aulic council residing at Vienna. Processes are here almost immortal, by reason of the infinite number of ceremonies and formalities wherewith they are embarrassed.

The *Imperial Chamber* is frequently afraid to pronounce sentence, for fear of exposing its awards to some disgrace; the princes sometimes not permitting such to be executed as displease them.

CHAMBER of Accounts, is a sovereign court in France, where accounts are rendered of all the kings revenues; inventories and oaths thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. The French have also,

Ecclesiastical CHAMBERS, which judge, by appeal, of differences arising on the raising of tythes: of these *ecclesiastical Chambers* there are nine; viz. at Paris, Bourdeaux, Rouen, Lyons, Tours, Thoulouse, Bourges, Pau, and Aix: they usually consist of the archbishop of the place, as president; other archbishops and bishops, a deputy of each of the dioceses, and three counsellors of parliament. The *Chamber* chuses as many counsellors out of the clergy as it thinks proper; as also a promoter.

Apollitical CHAMBER, at Rome, is that wherein affairs relating to the revenues and domains of the church and the pope are transacted.

CHAMBER of Audiences, or *grand CHAMBER*, a jurisdiction in each parliament of France.

At the first institution of their parliaments, there were two *Chambers*, and two kinds of counsellors; the one the *grand Chamber* for audiences, the counsellors whereof were called *lugeurs*, who only judged; the other the *Chamber of inquests*; the counsellors whereof were called *Rapporteurs*; who only reported processes by writing.

CHAMBER of the Edit, or *Mi-party*, was a court established by virtue of the edicts of pacification, in favour of those of the reformed religion: wherein the number of judges of either religion

gion were the fame; and to which recourfe was had in all affairs wherein any of the proteftants were concerned. This *Chamber* is now fuppreffed.

CHAMBER of London. See **CHAMBERLAIN**.

CHAMBERS of Commerce, are affembles of merchants and dealers, where they treat about matters relating to commerce. Of thefe there are feveral, eftablifhed in moft of the chief cities of France, by virtue of an arret of the 30th of Auguft 1701. Indeed there were fome before this general eftablifhment, particularly one at Marfeilles, and another at Dunkirk.

CHAMBER in War, is ufed for the place where the powder of a mine is lodged.

The *Chamber of a Mine* is a cavity of five or fix cubick feet; generally made of a cubical form.

CHAMBER of a Mortar, or Cannon of the new make, is a cell, or cavity at the bottom of the barrel, or chace, where the charge of powder is lodged.

The different form of the *Chamber*, is found by experiment to have an influence on the range of the piece. A cubical *Chamber* carries the ball to a lefs diftance than a circular one; and that lefs than a cylindrical one.

CHAMBERLAIN *, an officer who has the management, or direction of a chamber.

* The word *Chamberlain*, according to Ragueau, originally fignified a gentleman who was to fleep in the king's bed chamber, at his bed's feet, in the abfence of the queen.

There are almoft as many kinds of *Chamberlains* as chambers: The principal are as follow.

Lord Great CHAMBERLAIN of England, an officer of great antiquity and honour; being ranked the fixth great officer of the crown: a confiderable part of his function is at the coronation of a king; when he drefles him, carries the coif, fword, and gloves to be ufed on that occafion; the gold fword and fcarbard to be offered by the king; and the robe royal and crown: he alfo undrefles him, and waits on him at dinner; having for his fee the king's bed, and all the furniture of his chamber, the night-apparel, and the filver bafon wherein the king wafhes, with the towels.

To him likewife belongs the provifion of every thing in the houfe of lords, in the time of parliament; to which end he has an apartment near the lords houfe. He has the government of the palace of Weftminfter, and iffues out warrants for preparing, fitting out, and furnifhing Weftminfter-hall, againft coronations, trials of peers, &c.

He difpofes of the fword of ftate, to be carried by whom he pleafes; and when he goes to parliament, is on the right hand of the fword, the lord marfhal being on the left. On all folemn occafions, the keys of Weftminfter-hall, of the Court of Wards, and Court of Requests, are delivered him.

To him belong livery and lodging in the king's court; and he has certain fees from every bifhop at his doing homage to the king, and from every peer at his creation. Under his command are, the gentleman-usher of the black rod, the yeoman-usher, and door-keepers.

This honour was long held by the earls of Oxford; viz. from the time of Henry I. by an eftate-tail, or inheritance, but in the three laft coronations by the marquis Lindfey, after duke of Ancafter, by an eftate or inheritance from a daughter and her general, claimed, but controverted.

Lord CHAMBERLAIN of the Houftold, an officer who has the oversight and direction of all officers belonging to the king's chamber, except the precinct of the bed-chamber; which is abfolutely under the groom of the ftole.

He has the oversight and direction of the officers of the wardrobe, of the removing wardrobes, beds, trunks, revels, mufick, comedians, hunting, meffengers, trumpeters, drummers, handicrafts, and other tradesmen retained in the king's fervice: as alfo of all ferjants at arms, physicians, apothecaries, furgeons, barbers, the king's chaplains, &c. and adminifters the oath to all officers above ftairs.

There are alfo **CHAMBERLAINS of the king's courts**, of the *Exchequer*, of *North Wales*, of *Chefter*, of the *city of London*, &c. in thefe cafes, this officer is commonly the receiver of all rents and revenues belonging to the place whereof he is *Chamberlain*.

When there is no prince of Wales, and earl of Chefter, the *Chamberlain* of Chefter hath the receipt and return of all writs coming thither out of any of the king's courts.

In the *Exchequer*, there are two *Chamberlains*, who keep a controulment of the pells of receipts, and exitus, and have certain keys of the treafury and records: they alfo keep the keys of that treafury where the leagues of the king's predeceffors, and divers antient books, as *Dooms-day Book*, and the *Black Book* of the *Exchequer* remain.

The **CHAMBERLAIN of London** keeps the city money, which is laid up in the chamber of London, an apartment in Guild-hall: he alfo prefides over the affairs of mafters and apprentices; and makes free of the city, &c.

His office lafts but for a year, being chofen annually on Midfummer-day: but the cuftom usually obtains, to rechoose the

fame perfon; unlefs he have been chargeable with any mifdeemeanor in his office.

Vice-CHAMBERLAIN. See **VIC-CHamberlain**.

CHAMBRANLE, in architecture and joinery, the border, frame, or ornament of ftone, or wood, furrounding the three fides of doors, windows, and chimneys.

The *Chambranle* is different in the different orders: when it is plain, and without mouldings, it is called fimply and properly, *Band*, *Cafe*, or *Frame*.

The *Chambranle* confifts of three parts; the two fides, called *Ascendants*; and the top, called the *Traverse*, or *Supercilium*.

The *Chambranle* of an ordinary door, is frequently called *Door-Cafe*; of a window, *Window-Frame*.

CHAMELOT, in commerce. See **CAMBLER**.

CHAMFER, or **CHAMFERET**, in architecture, an ornament confifting of half a fcotia; being a kind of fmall furrow, or gutter on a column: called alfo *Strix*, and *Stria*.

CHAMFERING, or **CHAMFERAINING**, is ufed for cutting the edge, or end of any thing a-flope, or bevel. See the article **BEVEL**.

CHAMPAIN. See **CAMPAIGN**, and **CHAMPION**.

A Point CHAMPAIN, in heraldry, is a mark of difhonour in the coat of arms of him who kills a prifoner of war after he has cried quarter.

CHAMPARTORS, or **CHAMPERTORS**, are thofe who move pleas, or fuits, or caufe them to be moved, either by their own procurement or others; and fuc them at their proper cofts, to have part of the land, or other matter in variance: againft whom lies a writ of *Champarty*.

CHAMPARTY *, or **CHAMPERTY**, in law, a maintenance of any man in his fuit, upon condition of having part of the thing in queftion, be it lands or goods; in cafe it be recovered.

* The word comes from the French *Champ*, field, and *parti*, divided; the field, or thing contefted for, being fuppofed to be divided between the *Champarter*, or maintainer, and the perfon in whole right he fues.

This feems to have been an antient grievance; for notwithstanding feveral ftatutes againft it, and a form of writ accommodated to them, in the time of Edward I. yet in that of Edward III. it was enacted, That whereas redrefs on the former ftatute was only to be had in the king's-bench, which then followed the court; for the future it fhould likewife be cognizable by the juftices of the common pleas, and judges of affize.

CHAMPION *, properly fignifies, a perfon who undertakes a combat, in the place or quarrel of another: though the word is alfo fometimes ufed for him who fights in his own caufe. See **COMBAT**.

* Hottoman defines *Champion*, certator pro alio datus in duello, à campo dictus, qui circus erat decertantibus definitus: hence alfo the word *Camplight*.

Du Cange obferves, that *Champions*, in the juft fenfe of the word, were perfons who fought in lieu of thofe who being obliged by cuftom to accept the duel, had yet a juft excufe for difpenfing with it, as being too old, or infirm, being ecclefiaftick, or the like. He adds, that the *Champions* were usually retained, or hired for fums of money, and were held infamous.

There were alfo fome vaffals, who by the faith and homage fware to their lords, were obliged to fight for them in cafe of need.

Some authors hold, that any perfon was allowed the benefit of a *Champion*, excepting parricides, and thofe accused of very heinous offences.

This cuftom of deciding differences by combat, was derived from the north; whence it paffed into Germany, and, with the Saxons, into England, and infenfibly through the reft of Europe. See **DUEL**.

When two *Champions* were chofe to maintain the pro and the con, it was always required there fhould be a decree of the judge to authorize the combat: when the judge had pronounced fentence, the accused threw a gage, or pledge, ordinarily a glove, or gantlet; which being taken up by the accufer, they were both taken into fafe cuftody till the day of battel appointed by the judge.

If either of them fled after this, he was declared infamous, and deemed to have committed the crime in queftion. Nor were the accufer and accused now allowed to make up the matter; at leaft, not without the confent of the judge; which was never granted, without making the lord fatisfaction for the right of inheritance to the effects of the vanquifhed.

Before the *Champions* took the field, their heads were shaved, and they made oath that, "They believed the perfon who retained them was in the right; and that they would defend his caufe to the utmoft of their power." The weapons they ufed in the combat were a fword and buckler; fome fay, in England, only a club and buckler: when on horfeback, they were armed at all points. Their weapons were bleffed in the field by the

the priest, with a word of ceremony; and each took an oath he had no charm upon him.

The action began with railing, and giving each other ill language; at the found of a trumpet they were to go to blows: after the number of blows or rencounters expressed in the cartel, the judges of the combat threw a rod into the air, to advertise the *Champions* that the combat was ended. If it lasted till night, or ended with equal advantage on either side, the accused was reputed victor.

The punishment of the vanquished, was that which the crime merited whereof he was accused: if it were a capital crime, the vanquished was disarmed, led out of the field, and immediately executed, together with the party whose cause he maintained. If the conquered *Champion* fought in the cause of a woman, she was burnt.

CHAMPION of the king, is an officer whose business is, at the coronation of a king of England, to ride into Westminster-hall, armed cap-a-pe, when the king is at dinner, and throw down his gantlet by way of challenge; pronouncing, by a herald, "That if any man shall deny, or gainsay the king's title to the crown, he is there ready to defend it in single combat, &c." Which done, the king drinks to him, sending him a gilt cup with a cover, full of wine; which the *Champion* drinks, and has the cup for his fee.

This office, ever since the coronation of Richard II. has been continued in the family of Dymocke, who held the manor of Scrivelsby in Lincolnshire, hereditary from the family of the Marmions, who had it before, by grand serjeantry; on condition that the lord thereof should be the king's *Champion*.

CHAMPION, or rather **CHAMPAIN-Lands**, are lands not inclosed; or large fields, downs, or places without woods or hedges.

CHAMOIS, **CHAMMY**, or *Shammy*. See the article **SHAMMY**.

CHANCE, a term we apply to events, to denote that they happen without any necessary, or foreknown cause.

Our aim is, to ascribe those things to *Chance*, which are not necessarily produced as the natural effects of any proper cause: but our ignorance and precipitancy lead us to attribute effect to *Chance*, which have necessary and determinate causes.

When we say a thing happens by *Chance*, we really mean no more, than that its cause is unknown to us: not, as some vainly imagine, that *Chance* it self can be the cause of any thing. From this consideration, Dr. Bentley takes occasion to expose the folly of that old tenet, *The world was made by Chance*.

The case of the painter, who unable to express the foam at the mouth of a horse he had painted, threw his sponge in despair at the piece, and, by *Chance*, did that which he could not before do by design, is an eminent instance of the force of *Chance*: yet, it is obvious, all we here mean by *Chance*, is, that the painter was not aware of the effect; or that he did not throw the sponge with such a view: not but that he actually did every thing necessary to produce the effect; inasmuch, that considering the direction wherein he threw the sponge, together with its form, specific gravity, the colours where-with it was smeared, and the distance of the hand from the piece, it was impossible, on the present system of things, that the effect should not follow.

Chance is frequently personified, and erected into a chimerical being, whom we conceive as acting arbitrarily, and producing all the effects, whose real causes do not appear to us: in which sense, the word coincides with the *Τύχη*, *Fortuna* of the ancients.

CHANCE is also confounded with *Fate*, and *Destiny*.

CHANCE is also used for the manner of deciding things, the conduct or direction whereof, is left at large, and not reducible to any determinate rules or measures; or where there is no ground for preference: as at cards, dice, lotteries, &c.

For the **LAWS** of **CHANCE**, or the proportion of Hazard in Gaming, see **GAME**.

The ancient Sors, or *Chance*, M. Placette observes, was instituted by God himself; and in the Old Testament, we find several standing laws and express commands which prescribed its use on certain occasions: hence, the scripture says, *The Lot, or Chance, fell on St. Matthias*; when it was in question who should fill Judas's place in the apostolate.

Hence also arose the *sortes sanctorum*; or method of determining things among the ancient Christians, by opening some of the sacred books, and pitching on the first verse they cast their eye on, as a sure prognostick of what was to befall them. The *sortes Homericae*, *Virgilianae*, *Prænestinae*, &c. used by the heathens, were with the same view, and in the same manner. See **SORTES**.

St. Augustin seems to approve of this method of determining things future, and owns that he had practised it himself; grounded on this supposition, that God presides over *Chance*, and on *Proverbs* xvi. v. 33.

Many among the modern divines, hold *Chance* to be conducted in a particular manner by providence, and esteem it an extraordinary way which God uses to declare his will, and a

kind of immediate revelation.

CHANCE-MEDLEY, in law, the accidental killing of a man, not altogether without the killer's fault, though without any evil intent.

Stamford calls it, *Homicide by misadventure*: West calls it *Homicide mixed*; and says, it is when the killer's ignorance or negligence is joined with the *Chance*: as supposing a man lopping trees by the highway, and a bough falling chance to kill a passenger; the party here offends in not having given warning, whereby the slain might have been induced to take more heed.

CHANCELL*, is properly that part of the choir of a church, between the altar, or communion table, and the balustrade, or rail that incloses it; where the minister is placed at the celebration of the communion.

* The word comes from the Latin *Cancellus*, which in the lower Latin is used in the same sense, from *Cancelli*, lattices, or cross bars, wherewith the *Cancelli* were antiently inclosed, as they now are with rails.

The right of a seat and a sepulchre in the *Chancell*, is one of the privileges of founders of a Church.

CHANCELLOR, an officer, supposed originally to have been a notary, or scribe, under the emperors, and named *Cancellarius*, because he sat behind a lattice, called in Latin *Cancellus*, to avoid being crowded by the people.

Naude says, it was the emperor himself who sat and rendered justice within the lattice; the *Chancellor* attending at the door thereof, whence he took his title.

Others say, he had it from this, that all letters, addresses, petitions, &c. to the king, being first examined by him, were cancelled where amiss; others, because all patents, commissions, and warrants coming from the king, were examined and cancelled by him. Others, because he cancelled and annulled the sentences of other courts.

Du Cange, from Joannes de Janua, fetches the original of the word *Chancellor* from Palestine, where the houses being flat, and made in form of a terrace, with parapets or palliades called *Cancelli*; those who mounted these houses to rehearse any harangue, were called *Cancellarii*: whence the name passed to those who pleaded at the bar, which he calls *Cancelli forenses*, and at length to the judge who presided; and lastly to the king's secretaries.

This officer is now in great authority in all countries: the person who bears it with us, or the

Lord High CHANCELLOR of England, is the first person of the realm, next after the king, and princes of the blood, in all civil affairs. He is the chief administrator of justice next the sovereign; being the judge of the court of chancery.

All other justices are tied to the strict law, but the *Chancellor* has the king's absolute power to moderate the rigor of the written law, to govern his judgment by the law of nature and conscience, and to order all things *secundum equum et bonum*. Accordingly, Stamford says, the *Chancellor* has two powers, the one absolute, the other ordinary; meaning, that though by his ordinary power he must observe the same form of procedure as other judges, yet in his absolute power he is not limited by any written law, but by conscience and equity.

The offices of *Lord Chancellor* and *lord keeper*, are by the statute 5 *Eliz.* made the same thing; till that time they were different; and frequently subsisted at the same time in different persons: sometimes the *lord Chancellor* had a *Vice-Chancellor*, who was keeper of the seal.

The keeper was created *per traditionem magni Sigilli*, but the *lord Chancellor* by patent, though now that he has the keeper's office, he is created in like manner by giving him the seal. The *Chancellor* is likewise speaker of the house of Lords. See **PARLIAMENT**.

Though he be sole judge of the court of chancery, yet in matters of much difficulty he sometimes consults the other judges; so that this office may be discharged by one who is no professed lawyer, as antiently it commonly was. He has twelve assistants, or coadjutors, antiently called *Clerici*, as then being in holy orders, now *Masters in Chancery*, the first whereof is the *Master of the Rolls*. See **MASTER of the Rolls**, **MASTERS in Chancery**, &c.

CHANCELLOR of a Diocese, is a judge of the bishop's court, held in the cathedral of each diocese.

He was antiently called *Ecclesiasticus*, and *Ecclesiae Causidicus*, the church-lawyer. See **BISHOP of the Court**.

CHANCELLOR of a Cathedral. His office is thus described in the Monasticon: viz. to hear the lessons, and lectures read in the church, either by himself or his vicar; to correct and set right the reader when he reads amiss; to inspect schools, to hear causes, apply the seal, write and dispatch the letters of the chapter, keep the books, take care there be frequent preachings, both in the church and out of it, and assign the office of preaching to whom he lists.

CHA

CHANDELIER, or CHANDELEER, in fortification, a wooden frame, whereon are laid fascines or faggots, to cover the work-

chant is the *Ambrosian*, established by St. Ambrose. See *AM-
BROSIAN Chant*.

CHA

The second, the *Gregorian Chant*, introduced by pope Gregory the great, who established schools of *Chantors*, and corrected the church song.

This is still retained in the church under the name of *Plain Song*: at first it was called the *Roman Song*.

The *Plain*, or *Gregorian Chant*, is where the choir and people sing in unison, or all together in the same manner.

CHANT-Royal. See the article COMEDY.

CHANTLATE, in building, a piece of wood fastened near the ends of the rafters, and projecting beyond the wall, to support two or three rows of tiles, so placed to prevent the rain-water from trickling down the sides of the wall.

CHANTOR, or CHAUNTOR, a person who sings in the choir of a cathedral.

All great chapters have *Chantors* and chaplains to ease and assist the canons, and officiate in their absence.

St. Gregory first instituted the office of *Chantors*, erecting them into a body, called *Schola Cantorum*: though Anastasius seems to attribute their rise to pope Hilary, who lived an hundred years before Gregory.

But the word grows obsolete in this sense, and instead thereof we use the word *Chorister*, or singing-man.

CHANTOR is used, by way of excellence, for the precentor, or master of the choir; which is one of the dignities of the chapter.

The *Chantor* bears the cope and the staff at solemn festivals; and gives tune to the rest at the beginning of psalms and antiphons.

The antients called the *Chantor*, *Primicerius Cantorum*.

To him formerly belonged the direction of the deacons, and other inferior ministers.

CHANTRY, or CHAUNTRY. See the article CHAUNTY.

CHAOLLOGY, the history or description of the chaos.

Orpheus, in his *Chapology*, sets forth the different alterations, creations, and divers forms which matter went through till it became inhabitable; which amounts to the same with what we otherwise call *Cosmogony*, or the creation of the world.

Dr. Burnet likewise gives us a *Chaology*, in his theory of the earth. He represents the *Chaos*, as it was at first, entire, undivided, and universally rude and deformed; or the tohu bobu: then shews how it came divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened and became a solid habitable globe.

CHAOS, among the antient philosophers, was described a dark, turbulent kind of atmosphere; or a disorderly system, or mixture of all sorts of particles together, without any form or regularity: out of which the world was formed.

Chaos is every-where represented as the first principle, ovum, or seed of nature, and the world. All the ancient sophists, sages, naturalists, philosophers, theologues, and poets, hold that *Chaos* was the eldest and first principle, το Αρχαον χος.

The Barbarians, Phœnicians, Egyptians, Persians, &c. all refer the origin of the world to a rude, mixed, confused mass of matter. The Greeks, Orpheus, Hesiod, Menander, Aristophanes, Euripides, and the writers of the cyclic poems, all speak of the first *Chaos*: the Ionic and Platonic philosophers build the world out of it. The Stoics hold, that as the world was first made of a *Chaos*, it shall at last be reduced to a *Chaos*; and that all its periods and revolutions in the mean time, are only transitions from one *Chaos* to another. Lastly, the Latins, as Ennius, Varro, Ovid, Lucretius, Statius, &c. are all of the same opinion. Nor is there any sect or nation whatever, that does not derive their *Διακοσμις*, the structure of their world, from a *Chaos*.

The opinion first arose among the Barbarians, whence it spread to the Greeks, and from the Greeks to the Romans and other nations.

Dr. Burnet observes, that besides Aristotle and a few other pseudo-Pythagoreans, no body ever asserted, that our world was always, from eternity, of the same nature, form, and structure as at present: but that it had been the standing opinion of the wise men of all ages, that what we now call the terrestrial globe, was originally an unformed, indigested mass of heterogeneous matter, called *Chaos*; and no more than the rudiments, and materials of the present world.

It does not appear who first broached the notion of a *Chaos*. Moses, the eldest of all writers, derives the origin of his world, from a confusion of matter, dark, void, deep, without form, which he calls *Tohu Bobu*; which is precisely the *Chaos* of the Greek and Barbarian philosophers. And hence, possibly, might those philosophers derive their *Chaos*, with some alteration and interpolation.

Moses goes no further than the *Chaos*; nor tells us whence it took its origin, or whence its confused state; and where Moses stops, there, precisely, do all the rest.

Dr. Burnet endeavours to shew, that as the ancient philosophers, &c. who wrote of the cosmogony, acknowledged a *Chaos* for the principle of their world; so do the divines, or writers of the theogony, derive the origin or generation of their fabled gods from the same principle.

CHA

Mr. Whiston supposes the ancient *Chaos*, the origin of our earth, to have been the atmosphere of a comet; which, though new, yet, all things considered, is not the most improbable assertion. He endeavours to make it out by many arguments, drawn from the agreement which appears to be between them.

So that, according to him, every planet is a comet, formed into a regular and lasting constitution; and placed at a proper distance from the sun, revolving in a nearly circular orbit: and a comet is a planet either beginning to be destroyed, or re-made; that is, a *Chaos* or planet unformed, or in its primeval state, and placed, as yet, in an orbit very eccentric. See COMET.

CHAP. See CHILBLAIN.

CHAPEAU, in a general sense. See the article HAT.

CHAPEAU, is sometimes also used to denote the cap, or coronet armed with ermin, worn by dukes, &c.

The crest is born on the *Chapeau*; and by the *Chapeau* the crest and coat are separated; it being a rule, that no crest must touch the shield immediately.

CHAPEL*, or CHAPPEL, a kind of little church, served by an incumbent properly under the denomination of a *Chaplain*.

* The word *Chapel*, according to some, comes from the Greek *καπηλειον*, little tents, or booths, set up by traders in fairs to shelter them from the weather. Papias fetches it both from the Greek and Latin, *quasi capiens chaos*, or, *populum vel laudem*: others derive it from the *Chape*, or cope which served to cover the body: others, *à pellibus Caprarum*; because these places were antiently covered with goatskins. Rebuff derives it from *Capp*, St. Martin's cope, which the kings of France carried to war with them as their standard, and preserved very carefully in particular tents, thence called *Chapels*.

There are two kinds of *Chapels*, the one consecrated, and held as benefices: the other secular, being of the nature of oratories.

The first are built apart, and at a distance from the parish-church; being neither parishes, cathedrals, nor priories, but subsisting of themselves.

These are called by the canonists *Sub-Dia*, and by us *Chapels of ease*; as being erected at a distance from the mother-church, where the parish is large and wide, for the ease and conveniency of some of the parishioners who reside far off.

These are served by some inferior pastor, provided either by the rector of the parish, or by those for whose ease and benefit they are intended.

The second kind are frequently built in, or adjoining to a church, as a part thereof; having only a desk, &c. to read prayers in; and, in the Romish churches, an altar, &c. to celebrate mass on: but without any baptistry, or font.

These the canonists call *Sub testis*. They are generally erected by some considerable person, for the use of their own families; *ut ibidem familiaria sepulchra sibi constituant*.

The twenty-first canon of the council of Agda, held in 506, allows private persons the use of *Chapels*; but with prohibition to all clerks to officiate in them without leave from the bishop.

Free CHAPELS, are those *Chapels of ease* which have settled a revenue for perpetual maintenance of a pastor, &c. by charitable donations of lands, or rents bestowed on them; so as not to be any charge either to the rector, or the parishioners.

There are several collegiate churches in France, which they call *Saintes Chapelles*, holy Chapels; as those of Paris, Dijon, Bourges, Bourbon, &c. These are so denominated, by reason there are relics in them.

Hence, all those places where relics were preserved came to be called *Chapels*; and the persons who had the care of them, *Chaplains*.

CHAPEL is also a name given to a printer's workhouse; by reason, say some authors, printing was first actually performed in *Chapels*, or churches.

In this sense, they say, the orders, or laws of the *Chapel*, the secrets of the *Chapel*, &c.

Knights of the CHAPEL, was an order of knights instituted by king Henry VIII. in his testament, to the number of thirteen; tho' these have been increased to the number of twenty-six: they are called also *Poor Knights*.

These are not knights of the order of the garter; but are, as it were, their assistants or deputies, serving to discharge all their offices in the funeral services of the kings of England. They are subject to the office of the canons of Windsor, and live on pensions which the order assigns them.

They bear the blue or red cloak, with the arms of St. George on the left shoulder; but the cloak is only cloth, and they wear no sort of garter: which distinguishes them sufficiently from the knights of the garter.

CHAPERON, CHAPERONNE, or CHAPERON, properly signifies a sort of hood, or covering of the head, antiently worn both by men and women, the nobles, and the populace, and afterwards appropriated to the doctors, and licentiates in colleges, &c.

Hence, the name passed to certain little shields, and other funeral devices, placed on the foreheads of the horses that drew the hearses in pompous funerals, and which are still called *Chaperons*.

rooms, or Shafferoons; by reason such devices were originally fastened on the *Chaperonnes*, or hoods, wore by those horses with their other coverings of state.

CHAPTERS, in law, were antiently a summary of such matters as were to be inquired of, or presented before justices in eyre, justices of assize, or of the peace, in their sessions.

Chapters are now taken for articles delivered by the mouth of the justice in his charge to the inquest: though it appears from Bracton and Briton, they were formerly written exhortations given by the justices, for the good observation of the laws, and the king's peace; first read in open court, then delivered in writing to the grand inquest: which the grand jury, or inquest, were likewise to answer to upon their oaths, either affirmatively, or negatively.

CHAPLAIN, properly signifies, a person provided of a chapel; or who discharges the duty thereof. See **CHAPEL**.

CHAPLAIN is also used for an ecclesiastical person, in the house of a prince, or a person of quality, who officiates in their chapels, &c.

With us there are forty-eight *Chaplains* to the king, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the closet.

While in waiting, they have a table and attendance, but no salary.

The first *Chaplains* are said to have been those instituted by the ancient kings of France, for preserving the *Chape*, or *Cape*, with the other relics of St. Martin, which the kings kept in their palace, and carried out with them to the war. The first *Chaplain* is said to have been Gul. de Melmes, *Chaplain* to S. Louis.

CHAPLAIN in the order of *Malta*, is used for the second rank, or class, in that order; otherwise called *Diacon*.

The knights make the first class, and the *Chaplains* the second. See **MALTA**.

CHAPLAINS of the Pope, are the auditors, or judges of causes in the sacred palace; so called, because the pope antiently gave audience in his chapel, for the decision of cases sent from the several parts of Christendom.

He hither summoned as assessors the most known lawyers of his time, and they hence acquired the appellation of *Cepellani*, *Chaplains*.

It is from the decrees formerly given by these, that the body of decretals is composed: their number pope Sixtus IV. reduced to twelve.

If it be true, that the word *Chaplain* was first applied to those who preserved St. Martin's *Chape*, as above, the word must be derived from *Capa*, *Chape*; not from *Capella*, or *Cassula*, or *Cassia*, a case, as others imagine.

Some say, the shrines of relics were covered with a kind of *Tent*, *Cape*, or *Capella*, i. e. little cape; and that hence the priests who had the care of them, were called *Chaplains*. In time, these relics were deposited in a little church, either contiguous to a larger, or separate from it; and the same name, *Capella*, which was given to the cover, was also given to the place where it was lodged; and hence the priest who looked to it came to be called *Chaplain*.

CHAPELET, or **CHAPELETT**, a string of beads, used in the Romish church, to keep account of the number of pater-nosters, and ave-marys to be rehearsed in honour of God, and the holy virgin.

Chapelets are otherwise called *Pater-Nosters*: there are *Chapelets* of coral, of diamonds, of callambo, of St. Lucy's wood, &c. A rosary is a *Chapelet* of fifteen decads of ave-marys. See **ROSARY**.

Menage derives the word from *Chapeau*, hats; by reason of the resemblance the thing bears to a hatband, or *Chapelet* of roses, *Chapeau de roses*; the modern Latins call it, *Capellina*; the Italians more frequently *Corona*.

Larrey and P. Viret ascribe the first invention of the *Chapelet* to Peter the hermit, well known in the history of the Crusades.

There is a *Chapelet* of our Saviour, consisting of thirty-three beads, in honour of his thirty-three years living on earth, instituted by father Michael, the Camaldulian.

The orientals have a kind of *Chapelet*, which they call *Chains*, and which they use in their prayers, rehearsing one of the perfections of God on each link, or bead. The great Mogul is said to have eighteen of these chains, all of precious stones, some diamonds, others rubies, pearls, &c.

The Turks have likewise *Chapelets*, which they bear in the hand, or hang at the girdle: but, father Dandini observes, they differ from those used by the Romanists, in that they are all of the same bigness, and have not that distinction into decads; though they consist of six decads, or sixty beads. He adds, that the muslimen have presently run over the *Chapelet*, the prayers being extremely short, as containing only these words, *Praise to God*, or these, *Glory to God*, for each bead.

Besides the common *Chapelet*, they have likewise a larger one, consisting of one hundred beads, where there is some distinction, as being divided by little threads into three parts, on one of which they repeat thirty times *Soubhan allah*, i. e. *God is worthy to be praised*; on another, *Ellahm allah*, *Glory be to God*;

and on the third, *Alla echer, God is great*. These thrice thirty times making only ninety; to complete the number one hundred, they add other prayers for the beginning of the *Chapelet*. He adds, that the mahometan *Chapelet* appears to have had its rise from the *Mea veracath*, or hundred benedictions; which the Jews are obliged to repeat daily, and which we find in their prayer-books; the Jews and Mahometans having this in common, that they scarce do any thing without pronouncing some laud, or benediction.

CHAPELET, or **CHAPELETT**, in architecture, a little moulding cut, or carved into round beads, pearls, olives, or the like.—See **Tab. Archit.** fig. 12.

A *Chapelet*, in effect, is little else but a baguette enriched with sculpture. See **BAGUETTE**.

CHAPPAR *, a courier of the king of Persia, who carries dispatches from court to the provinces, and from the provinces to the court. See **COURIER**.

* The word, in the original Persian, signifies *Courier*.

The posts, M. Tavernier tells us, are not established and regulated in Persia as among us; when the court sends out a *Chappar*, the sopher's master of the horse furnishes him with a single horse, how long soever his journey be, and a man to run after him: when his horse is weary, he takes that of the first horseman he meets with, who dares not make the least refusal, and sends his own home by the man who follows him. As for the master of the new horse he has taken, he must run, or at least send after the *Chappar* to retake him, when the *Chappar* dismounts some other horseman to change him.

CHAPPE, in heraldry, the partition of an escutcheon, by lines drawn from the center of the upper edge to the three angles below: as represented in **Tab. Herald.** fig. 14. which they blazon *Chappe Or*, and *Vert*.

The sections of the sides are to be of a different colour from the rest. Mackenzy calls it, *A chief party per bend dexter, or sinister*, or both.

CHAPPEL, or **CHAPEL**. See the article **CHAPEL**.

CHAPTER, **CAPITULUM**, a community of ecclesiastics belonging to a cathedral, or collegiate church.

The chief, or head of the *Chapter*, is the dean; the body consists of canons, or prebendaries, &c.

The *Chapter* has now no longer any share in the administration of the diocese, during the life of the bishop; but succeeds to the whole episcopal jurisdiction during the vacancy of the see.

The origin of *Chapters* is derived from hence, that antiently the bishops had their clergy residing with them in their cathedrals, to assist them in the performance of sacred offices, and in the government of the church; and even after parochial settlements were made, there were still a body of clerks who continued with the bishop, and were indeed his family, maintained out of his income.

After the monastick life grew into request, many bishops chose monks rather than seculars for their attendants.

These bodies, either of monasticks or seculars, then had the same privilege of choosing the bishop, and being his council, which the whole clergy of the diocese had before: but, by degrees, their dependance on the bishop grew less and less; and then they had distinct parcels of the bishop's estate assigned them for their maintenance; till at last, the bishop had little more left than the power of visiting them.

On the other hand, these capitular bodies by degrees also lost their privileges; particularly that of choosing the bishop, for which the kings of England had a long struggle with the pope: but at last, Henry VIII. got this power vested in the crown; and now the deans and *Chapters* have only the shadow of it.

The same prince likewise expelled the monks from the cathedrals, and placed secular canons in their rooms; those he thus regulated, are called *Deans* and *Chapters of the new foundation*; such are Canterbury, Winchester, Worcester, Ely, Carlisle, Durham, Rochester, and Norwich: such also are the *Chapters* of the four new sees, of Peterborough, Oxford, Gloucester, and Bristol.

CHAPTER, is also applied to the assemblies held by religious, and military orders, for deliberating on their affairs, and regulating their discipline.

Papias says, they are so called, *quod Capitula ibi legantur*.

The establishment of general *Chapters* of religious orders, is owing to the Cistercians, who held the first in 1116, and were soon followed by the other orders.

CHAPTER is also used for a division of a book; contrived for keeping the matters treated thereon more separate, clear, and distinct.

The antients were unacquainted with the division of books into *Chapters*, and sections: Papias says, the name *Chapter*, *Caput*, arose hence, *quod sit alterius sententia Caput, or quod Capiat, totum summam*. S. Augustine compares *Chapters* to inns, inasmuch as they refresh the reader, as those the traveller.

The three **CHAPTERS**, is a phrase famous in ecclesiastical history, signifying a volume published by Theodoret, an adherent of Nestorius, against St. Cyril, consisting of a letter of Ibas priest of Edessa, to Marius a bishop of Persia; of extract from the works of Diodorus of Tarsus, and Theodore of Mopsuestia, wherein the same doctrines were taught, that were contended

for by Nestorius: and of two pieces of Theodoret, the one against the council of Ephesus, the other against the anathemas of St. Cyril.

These make the famous three *Chapters*; which have been, since, condemned by various councils and many popes.

CHAPTREL. See the article IMPOST.

CHARACTER*, in a general sense, signifies a mark, or figure drawn on paper, metal, stone, or other matter, with a pen, graver, chisel, or other instrument, so signify, or denote any thing.

* The word is Greek, χαρακτήρ, formed from the verb χαραττίζειν, *insculpere*, to engrave, impress, &c.

The various kinds of *Characters* may be reduced to three heads, viz. *Literal Characters*, *Numeral Characters*, and *Abbreviations*.

LITERAL CHARACTER, is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea, or conception of the mind.

These may be divided, with regard to their nature and use, into *Nominal*, *Real*, and *Emblematical*.

NOMINAL CHARACTERS are those we properly call *Letters*; which serve to express the names of things.

REAL CHARACTERS, are those that instead of names, express things, and ideas.

Emblematical, or *symbolical CHARACTERS*, have this in common with real ones, that they express the things themselves; but they also have this further, that they in some measure personate them, and exhibit their form: such are the hieroglyphics of the ancient Egyptians.

LITERAL CHARACTERS may be again divided, with regard to their invention and use, into *Particular* and *General*.

PARTICULAR CHARACTERS, are those peculiar to this, or that nation; or that have been so: Such are the Roman, Italian, Greek, Hebrew, Arabic, Gothic, Chinese, &c. *Characters*.

UNIVERSAL CHARACTERS, are also *real Characters*, and make what some authors call a *Philosophical Language*.

The diversity of *Characters* used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of *Characters* that should be universal, and which each people should read in their own language. The *Character* here is to be real, not nominal: to express things, and notions; not, as the common ones do, letters, or sounds: yet to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, every one should retain their own language, yet every one understand that of each other, without learning it; only by seeing a real or universal *Character*, which should signify the same thing to all people; by what sounds forever each express'd it in his particular idiom. For instance, by seeing the *Character* destined to signify *to drink*, an Englishman should read *to drink*; a Frenchman *boire*; a Latin *bibere*; a Greek *μενεν*; a Jew *סוד*; a German *trinken*; and so of the rest: in the same manner as seeing a horse, each people expresses it after their own manner; but all mean the same animal.

This real *Character* is no chimera; the Chinese and Japanese have already something like it. They have a common *Character* which each of those nations understand alike in their several languages; though they pronounce it with such different sounds, that they do not understand a tittle of one another in speaking.

The first, and most considerable attempts for a real *Character*, or philosophical language in Europe, are those of bishop Wilkins, and Dalgarnie: but these, with how much art forever they were contrived, have yet proved ineffectual.

M. Leibnitz had some thoughts the same way; he thinks those great men did not hit the right method. And adds, it was probable, indeed, that by this means, people, who do not understand one another, might easily have a commerce together; but that they have not hit on true, *real Characters*.

According to him, the *Characters* should resemble those used in algebra; which, in effect, are very simple, yet very expressive; without any thing superfluous or equivocal; and contain all the varieties required.

The real *Character* of bishop Wilkins has its just applause: Dr. Hook recommends it on his own knowledge and experience, as a most excellent scheme; and to engage the world to the study thereof, publishes some fine inventions of his own therein.

M. Leibnitz tells us, he had under consideration an *Alphabet of human thoughts*; in order to a new philosophical language, on his own scheme; but his death prevented this from being brought to maturity.

M. Lodwic, in the *Philosophical Transactions*, gives us a plan of an universal *Alphabet*, or *Character* of another kind: this was to contain an enumeration of all such single sounds, or letters, as are used in any language; by means whereof, people should be enabled to pronounce truly and readily any language; to describe the pronunciation of any language that should be pronounced in their hearing; so, as others accustomed to this language, though they had never heard the language pronounced, should at first be able truly to pronounce it: and, lastly, this *Character* to serve as a standard to perpetuate the sounds

of any language.

In the *Journal Literaire*, an 1720, we have a very ingenious project for an universal *Character*: the author, after obviating the objections that might be made against the feasibility of such schemes in the general, proposes his own: his *Characters* are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new *Characters* at once faced: the Arabic figures having already all the universality required.

The advantages are immense: for 1^o, We have here a stable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2^o, Whereas the difficulty of pronouncing a foreign language, is such as usually gives the learner the greatest trouble, and there are even some sounds which foreigners never attain to; in the *Character* here proposed this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accustoming the pen and the eye to affix certain notions to *Characters* that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflections of words, are here to be expressed by the common letters: for instance, the same *Character* shall express a *Filly*, or a *Colt*, a *Horse*, or a *Mare*, an *old Horse*, or an *old Mare*, as accompanied with this or that distinctive letter, which shall shew the sex, youth, maturity, or old age: a letter is also to express the bigness or size of things; thus, v. g. a man with this or that letter, to signify a *great man*, or a *little man*, &c.

The use of these letters belongs to the grammar, which once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar, is, that it would only have one declension and one conjugation: those numerous anomalies of grammarians are exceeding troublesome, and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the *Character* here proposed, men of sense having the introduction of it, would have a new ground, whereon to build regularly.

The difficulty is not in inventing the most simple, easy and commodious *Character*, but in the engaging the several nations to use it; there being nothing they agree less in, than the understanding and pursuing their common interest.

LITERAL Characters, again, may be divided with respect to the nations among whom they have been invented and used; into *Greek Characters*, *Roman Characters*, *Hebrew Characters*, &c. The *Character* now ordinarily used throughout Europe, is the *Latin Character* of the antients.

The *Latin Character* was formed from the Greek, and that from the Phœnician, which Cadmus brought into Greece.

The Phœnician *Character*, was the same with that of the antient Hebrew, which subsisted to the time of the Babylonish captivity; after which they used that of the Assyrians, which is the square Hebrew, now in use; the antient being only found on some Hebrew medals, commonly called *Samaritan Medals*.

Postellus, and others shew, that beside the Phœnician, the Chaldeæ, Syriac, and Arabic *Characters* were likewise formed from the antient Hebrew.

The French were the first who, with the latin office of St. Gregory, admitted the *Latin Characters*. And in a provincial synod, held in 1091, at Leon in Spain, the use of the Gothic *Characters* invented by Ulfilas, was abolished, and the Latin ones established.

Medallists observe, that the Greek *Character*, consisting only of majuscule letters, has preserved its uniformity on all medals, as low as the times of Gallienus; there being no alteration found in the turn of the *Character*, notwithstanding the many considerable ones both in the use and pronunciation. From the time of Gallienus, it appears somewhat weaker and rounder: from the time of Constantine to Michael, the space of five hundred years, we find only *Latin Characters*; and after Michael, the Greek *Characters* re-commence: but from that time they began to alter with the language, which was then a mixture of Greek and Latin. See GREEK.

The *Latin medals* preserve both their *Character* and language, as low as the translation of the seat of the empire to Constantinople. Towards the time of Decius the *Character* began to alter, and to lose of its roundness and beauty: some time after it retrieved itself, and subsisted tolerably till the time of Justin; when it fell into the last barbarity mentioned, under Michael; though it afterwards grew worse, and degenerated into the Gothic: so that the rounder and better formed the *Character* is on a medal, the greater pretence it has to antiquity.

NUMERAL CHARACTERS, are those used to express numbers.

Numeral Characters are either letters; or figures, otherwise called *Digits*.—The kinds now chiefly in use, are the Common, and the Roman: to which may be added the Greek, and another called the *French Character*; as also the letters of other alphabets which have been made use of to express numbers.

Common Character is that ordinarily called the *Arabic*, as supposed to have been invented by the Arab astronomers; though the Arabs

Arabs themselves call it the *Indian Character*; as if they had borrowed it from the people of India.

The *Arabic Characters* are ten, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; the last is called *Uphar*.

The *Arabic Character* is used almost throughout Europe, and that on almost all occasions; in commerce, in measuring, in astronomical calculations, &c.

Roman Character consists of the majuscule letters of the Roman alphabet; whence probably its name: or, perhaps, from its being used by the ancient Romans on their coins, and in the inscriptions of their public monuments erected in honour of their gods, and great men; on their sepulchres, &c.

The numeral letters that compose the *Roman Character* are in number seven, viz. I, V, X, L, C, D, M.

The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand.

The I repeated twice, makes two, II; thrice, three, III; four is expressed thus IV. I before V or X, taking an unit from the number expressed by each of those letters.

To express six, an I is added to a V, VI; for seven, two, VII; and for eight, three, VIII: nine is expressed by an I before X, IX; agreeably to the preceding remark.

The like remark may be made of the X before L or C, except that the diminution is by tens, not units: thus, XL signifies forty, and XC ninety; an L followed with an X, sixty, LX, &c. The C before D or M, diminishes each by a hundred.

Besides the letter D, which expresses five hundred, that number may also be expressed by an I before a C inverted, thus IC; and thus, in lieu of the M, which signifies a thousand, is sometimes used an I between two C's, the one direct, the other inverted, thus CIC: agreeable to this, five hundred may be expressed IC C; and seven hundred, IC C C, &c.

The addition of C and S before, or after, raises CIC by tens, thus, CCIC, 1000, CCCIC, 100,000, &c.

This is the common way of notation, formerly used by the Romans; who also expressed any number of thousands by a line drawn over any numeral less than a thousand; e.g. V 5000, LX 60000, so likewise M is 1,000,000; MM is 2,000,000, &c.

Besides which, (I.) certain liberties or variations have been admitted, at least in some modern writers; e.g. IIX, 8; IICIX, 89. (II.) And certain *Characters* have been used, which seem to have been derived from the letters; e.g. M, by which they express (Mille) 1000, was turned into CXO, or CO; half of which, viz. IO, stood for 500. (III.) And for the easier writing of these *Characters*, 1. IO seems to have been altered into D; 2. IC into A, or V; (3.) IC into C or A: whence thus 10000, A A 20000. V. X.

Greek Numerals. The Greeks had three ways of expressing numbers.

(I.) The most simple way, for every single letter, according to its place in the alphabet, to denote a number from a 1 to a 24; in which manner the books of Homer's *Ilias* are distinguished.

(II.) Another way was by dividing the alphabet into (1.) 8 units: a 1, 2, &c. (2.) 8 Tens: a 10, 20, &c. (3.) 8 Hundreds: a 100, 200, &c. N. B. Thousands they expressed by a point or accent under a letter, e.g. a 1000, 2000, &c.

(III.) A third way was by six capital letters, thus, I [α for 100], II [β for 200], III [γ for 300], IV [δ for 400], V [ϵ for 500], VI [ζ for 600], VII [η for 700], VIII [θ for 800], IX [ι for 900], X [κ for 1000], XI [λ for 1100], XII [μ for 1200], XIII [ν for 1300], XIV [ξ for 1400], XV [\o for 1500], XVI [π for 1600], XVII [ρ for 1700], XVIII [σ for 1800], XIX [τ for 1900], XX [υ for 2000], XXI [ϕ for 2100], XXII [χ for 2200], XXIII [ψ for 2300], XXIV [ω for 2400].

N. B. 6,90,900, are expressed by *Characters*.

Hebrew Numerals. The Hebrew alphabet was divided into 9 Units: a 1, 2, &c. 9 Tens: a 10, 20, &c. 9 Hundreds: a 100, 200, &c. 9 Thousands: a 1000, 2000, &c. 9 Tens of thousands: a 10,000, 20,000, &c. 9 Hundreds of thousands: a 100,000, 200,000, &c. 9 Millions: a 1,000,000, 2,000,000, &c.

Thousands (1.) were sometimes expressed by the units prefixed to hundreds, as, 1534, &c. and even to tens, as, 1070, &c. (2.) But generally by the word 1000;

2000; 3000, with the other numerals prefixed, to signify the number of thousands: e.g. 2000, &c.

French Character, so called, because invented and chiefly used by the French, is more usually denoted, *Character of Account*, or *Finance*.

It consists of six figures; partly taken from the letters of the usual current hand, and partly invented by the contriver; the six *Characters* are j, b, x, L, C, y.

The j consonant standing for one, the b for five, the x for ten, the L for fifty, the C for an hundred, and the last *Character* y for a thousand.

This *Character* is only an imitation of the *Roman Character*; and its use is in most respects the same, particularly in what relates to the combination of certain letters, which placed before or after others, diminish or increase their value. Indeed it has these things peculiar in it, that when several units occur successively, only the last is expressed. 2dly, That ninety, and the following numbers to one hundred, are expressed thus, jiiij ninety; jiiijx ninety one; jiiijxx, &c.

It is principally used in the chambers of accounts, in the accounts given in by treasurers, receivers, farmers, and other persons concerned in the management of the revenue.

CHARACTERS in printing, denote the letters or types, by the va-

rious arrangement whereof, are composed forms; whence impressions are taken, by means of a press, on paper. For the method of casting these *Characters*, see *Letter-Foundry*.

CHARACTER is also used, in several of the arts, for a symbol, contrived for the more concise, immediate, and artful conveyance of the knowledge of things.

In this sense of the word, Paulus Diaconus refers the invention of *Characters* to Ennius; who, he says, contrived the first eleven hundred. To these were many more added by Tyro, Cicero's freedman, and by Philargyrus, Fannius, and Aquila, freedmen of Mecenas.

Lastly, L. Annaeus Seneca made a collection of them, reduced them into order, and increased their number to five thousand.

Tyro's notes may be seen at the end of Gruter's inscriptions.

Valerius Probus, a grammarian, in the time of Nero, laboured to good purpose in explaining the notes of the antients. P. Diaconus wrote an ample treatise of the explication of the *Characters* in law, under the reign of the emperor Conrad I. and Goltzius another for those of medals.

Characters, or symbols, are now chiefly affected in the several parts of mathematics; particularly in algebra, geometry, trigonometry, and astronomy: as also in medicine, chymistry, music, &c. The principal of each kind we shall here subjoin.

CHARACTERS used in Arithmetic and Algebra.

a, b, c, and d, the first letters of the alphabet, are the signs or *Characters* that denote given quantities; and x, y, z, &c. the last letters, are the *Characters* of quantities sought.

Note, Equal quantities are denoted by the same *Character*.

m, n, r, s, t, &c. are *Characters* of indeterminate exponents, both of ratios and powers; thus x^m, yⁿ, &c. denote indeterminate powers of different kinds; m, n, r, s, t, &c. different multiples, or submultiples of the quantities x, y, z, according as m, n, r, s, t, are either whole numbers or fractions.

+ Is the sign of real existence, and is called the *affirmative* or *positive* sign; importing the quantities to which it is prefixed, to be of a real and positive nature.

It is also the sign of addition, and is read *plus*, or *more*; thus 9 + 3, is read 9 plus 3; or 9 more 3: that is, nine added to 3, or the sum of 9 and 3, equal to 12.

— Before a single quantity, is the sign of *negation*, or *negative* existence; shewing the quantity to which it is prefixed to be less than nothing.

Between quantities, it is also the sign of subtraction, and is read *minus*, or *less*; thus 14 — 2, is read 14 minus, or abating 2; that is, the remainder of 14, after 2 has been subtracted, viz. 12.

= Is the sign of *equality*: thus, 9 + 3 = 14 — 2; signifies, 9 plus 3, to be equal to 14, minus 2.

This *Character* was first introduced by Harriot: Des Cartes in lieu of it uses >. Before Harriot there was no sign of equality at all.

Wolffius, and some other authors, use the same *Character*, =, for the identity of ratios; or to denote the terms to be in a geometrical proportion: which most authors express thus: x is the sign of multiplication, denoting the quantities on either side to be multiplied into one another: thus, 4 x 6, is read 4 multiplied by 6; or the factum, or product of 4 and 6 = 24; or the rectangle between 4 and 6.

Ordinarily, however, in algebra, the sign is omitted, and the two quantities put together: thus, b d expresses the product of the two numbers denoted by b and d, which suppose 2 and 4, the product whereof is 8, signified by b d.

Wolffius and others, make the sign of multiplication a dot (.) between the two factors: thus 6.2 signifies the product of 6 and 2 = 12.

Where one or both the factors are compounded of several letters, they are distinguished by a line drawn over them: thus, the factum of a + b into d, is wrote d . a + b.

Guido Grandio, and after him Leibnitz, Wolffius, and others, to avoid the perplexity of lines, in lieu thereof distinguishing the compound factors, by including them in a parenthesis, thus (a + b) d.

÷ Is the *Character* of division: thus, a ÷ b denotes the quantity a to be divided by b.

Indeed, ordinarily in algebra, the quotient is expressed fractionally; thus, $\frac{a}{b}$ denotes the quotient of a divided by b.

Wolffius, &c. make the sign of division (:), thus, 8 : 4 denotes the quotient of 8 divided by 4 = 2.

If either the divisor or dividend, or both, be composed of several letters; v.g. a + b, divided by c; instead of writing the quotient fractionally thus $\frac{a+b}{c}$ Wolffius, &c. include the compound quantities in a parenthesis; thus, $\frac{(a+b):c}{c}$.

⊙ Is the *Character* of *involution*, or of producing the square of any quantity by multiplying it by itself.

√ The *Character* of *evolution*, or of extracting the roots out of the several powers; the reverse of ⊙.

7 Is the sign of *Majority*, or of the excess of one quantity beyond another: some use this 7, or this 7.

ℒ Is the sign of *Minority*: these two *Characters* were first introduced by Harriot, and have been since used by Wallis and Lamy.

Other authors use others; some this, ⊖; but the generality none at all.

us The sign of *Similitude* commended in the *Miscellanea Berolinensia*, and used by Leibnitz, Wolfius, and others; though the generality of authors use none. See *SIMILITUDE*.
The same *Character* is used in other authors for the difference between two quantities, while it is yet unknown which is the greater.

✓ Is the *Character* of *Radicality*, and shews that the root of the quantity, to which it is prefixed, is extracted, or to be extracted: thus, $\sqrt{25}$, or $\sqrt[4]{25}$, denotes the square root of 25, viz. 5. and $\sqrt[3]{25}$, the cube root of 25. See *Root*.

This *Character* sometimes affects several quantities distinguished by a line drawn over them, thus $\sqrt{b+d}$, denotes the sum of the square roots of b and d .

Wolfius, &c. in lieu hereof, includes the roots composed of several quantities in a parenthesis, adding its index: thus $(a+b-c)^2$ denotes the square of $a+b-c$, ordinarily written $a^2+b^2+c^2$.

Is the *Character* of arithmetical proportion disjunct; thus 7 : 3 : 13 . 9. intimates three to be exceeded by 7, as much as 9 by 13; viz. by 4.

This is the *Character* of identity of ratio, and geometrical proportion disjunct; thus, 8 : 4 : 30 : 15. expresses the ratio of 30 to 15, to be the same with that of 8 to 4; or that the four terms are in geometrical proportion, viz. 8 to 4 as 30 to 15.

Wolfius, in lieu hereof, uses the *Character* of equality $=$; which he prefers to the former, as more scientific and expressive.

The *Character* of geometrical proportion continued, implying the ratio to be carried on without interruption: thus, 2, 4, 8, 16, 32, &c. are in the same uninterrupted proportion.

CHARACTERS in Geometry and Trigonometry.

|| is the *Character* of parallelism; implying two lines or planes to be equidistant from each other. See *PARALLEL*.

△ *Character* of a triangle. See *TRIANGLE*.

□ A square. = Equality of sides.

▭ A rectangle. = An angle.

○ A circle. = A right angle.

∠ Equality of angles. = A perpendicular.

° A degree; thus 75° implies 75 degrees.

' A minute, or prime; thus, 50' implies 50' minutes.

'' A second, &c. The *Characters* of seconds, thirds, fourths, &c. of a degree: thus, 5'', 6'', 18'', 20'', denotes 5 seconds 6 thirds, 18 fourths, and 20 fifths.

Note, the same *Characters* are sometimes used, where the progression is by tens, as it is here by sixties.

CHARACTERS used in the arithmetic of Infinites.

. The *Character* of an infinitesimal, or fluxion: thus, \dot{x} , \dot{y} , &c. express the fluxions, or differentials of the variable quantities x and y ; two, three, or more dots, denote second, third, or higher fluxions.

This method of denoting the fluxions, we owe to Sir Isaac Newton, the inventor of fluxions: it is adhered to by the English; but foreigners generally follow M. Leibnitz, and in lieu of a dot prefix the letter d to the variable quantity; on pretence of avoiding the confusion arising from the multiplication of dots, in the differencing of differentials.

d The *Character* of a differential of a variable quantity; thus, $d x$ is the differential of x ; $d y$ the differential of y .

The *Character* was first introduced by M. Leibnitz; and is followed by all but the English, who, after Sir Isaac Newton, express the differential by a dot over the quantity. See *CALCULUS Differentialis*.

CHARACTERS used in astronomy.

♄ *Character* of Saturn.

♃ Jupiter.

♂ Mars.

♀ Venus.

☿ Mercury.

☼ The Sun.

☾ The moon.

♁ The earth.

♈ Aries.

♉ Taurus.

♊ *Character* of Gemini.

♋ Cancer.

♌ Leo.

♍ Virgo.

♎ Libra.

♏ Scorpio.

♐ Sagittarius.

♑ Capricornus.

♒ Aquarius.

♓ Pisces.

CHARACTERS of the aspects, &c.

☿ Conjunction.

☿ Semiconjunction.

☿ Sextile.

☿ Quintile.

☿ Quartile.

☿ Tridectile.

☿ Trine.

☿ Biquintile.

☿ Quincunx.

☿ Opposition.

☿ Scorpion's head.

☿ Scorpion's tail.

CHARACTERS of time.

A M (ante meridiem) or A. morning.

O. or N. noon.

P. M. (post meridiem) or A. afternoon.

Rests or Pauses of Time.

CHARACTERS used in music.

Characters of the musical notes, with their proportions.

	A Large	8.	
	A long	4.	
	Breve	2.	
	Semibreve	1.	
	Minim	$\frac{1}{2}$.	
	Crotchet	$\frac{1}{4}$.	
	Quaver	$\frac{1}{8}$.	
	or Semiquaver	$\frac{1}{16}$.	
	or Demisemiquaver.	$\frac{1}{32}$.	

✕ *Character of a sharp Note*: this *Character* at the beginning of a line, or space, denotes all the notes in that line or space, to be taken a semitone higher than in the natural series. And the same affects all their octaves, above and below, though not marked.
When the *Character* is prefixed to any particular note, it shews that note alone to be a semitone higher than it would be without such *Character*.

✓ *Character of a flat Note*: this *Character*, at the beginning of a line, or space, shews, that all the notes in that line, or space, are to be taken a semitone lower than in the natural series; affecting, in like manner, all the octaves, both above and below. When prefixed to any note, it shews that note alone to be a semitone lower than it would otherwise be.

♮ *Character of a natural Note*. Where, in a line or series of artificial notes, marked at the beginning for either sharps or flats, the natural note happens to be required, it is denoted by this *Character*.

♫ *Character of Treble Clef*.

♭ *Mean Clef*.

♮ *Bass Clef*.

CHARACTERS of Time.

2, or 3, or 4; *Characters of common, or duple Time*; signifying the measure of two crotchets to be equal to two notes, whereof four make a semibreve.

♩ *Characters that distinguish the movements in common time*: the first implying flow; the second brisk; the third very quick.

♩, ♪, ♫, ♭, ♮; *Characters of the simple triple Time*; whose measure is equal either to three semibreves, or to three minims, &c.

♩, ♪, ♫, ♭, ♮; *Characters of mixed triple time*; where the measure is equal to six crotchets, or six quavers, &c.

♩, ♪, ♫, ♭, ♮; *Characters of compound triple Time*.
♩, ♪, ♫, ♭, ♮; *Characters of the fourth species of triple Time*; called, *The measure of twelve Times*.

For Characters in printing, see CORRECTION.

CHARACTER is also used for a certain manner, air, or assemblage of qualities, resulting from several particular marks, which distinguish a thing from any other, so as it may be known thereby.

Thus, we say, The Character of Achilles; generosity and greatness of mind was the Character of the Romans; Cicero had a Character of politeness, which is wanting in Demosthenes; every passion has its peculiar Character.

The writers of Characters are Theophrastus, whose fragments are still extant; Du Moulin, in his *Exemplar Morum*; Paschal, in *Characteres Virtutum et Vitiurum*; M. de la Chambre, in his *Characters of the Passions*; and de la Bruyere, in his *Characters and Manners of the Age*.

CHARACTER, in poetry, especially the epopee and drama, is the result of the manners, or that which each person has peculiar and singular in his manners, whereby he is distinguished from others.

The poetical Character, Boffu observes, is not properly any virtue or quality in particular; but 'tis a composition of several, mixed and combined in various degrees, according to the occasions of the fable, and the unity of the action. All the simple qualities that enter this compound, must not have the same rank, nor be equal to each other: since, in that case, one prevailing on one occasion, and another on another, the Character will appear changeable; and the poem, as well as the hero, will seem animated with several souls.

There must, therefore, be one to reign over all the rest; and this must be found in some degree in every part: just as the same hero in several paintings, should have the same lines and features, how different soever his postures and passions may be.

This first quality, in Homer's Achilles, is wrath; in Ulysses, dissimulation; and in Virgil's Æneas, mildness: each of which may, by way of eminence, be called the Character of those heroes.

These are never to go alone, but always are to be accompanied with others, to give them the greater lustre; either by hiding their defects, as in Achilles, whose anger is palliated by a world of courage; or by making them center in some solid virtue, as in Ulysses, whose dissimulation makes a part of his prudence; and Æneas, whose mildness is chiefly employed in a submission to the will of the gods.

These secondary qualities of courage, prudence, and submission, make the goodness of the Characters of those heroes, and even of the poems.

Boffu adds, that the quality of courage must always have a share in the Character of a hero, to serve as a support to the rest: the heroic Character, therefore, he makes a compound of three kinds of qualities. Those of the first kind are necessary and essential to the fable; those of the second are the supplements, or embellishments of the first; and courage, which sustains the other two, make the third.

The first, which is the chief, is to be some universal quality, to have place on all occasions, and to distinguish the hero wherever he is found.

For the unity of Character, we have Horace's express command, *Sit quodvis simplex duntaxat et unum*. Boffu adds, that the Character is not less the soul of the hero and the whole action, than the fable is of the poem; and of consequence the unity must be as exact in the one as the other: which accordingly we find observed both by Homer and Virgil.

The unity of Character is somewhat different from that of the manners: in the latter, the unity or equality consists in not giving contrary sentiments to the same person; which is not sufficient to the unity of Character, but to this must be added, that the same spirit must always appear on all occasions, whether contrary or otherwise: thus, Æneas, shewing a deal of goodness in the first part of the poem, and a world of valour in the second, but without discovering any of his former piety and gentleness; there had been no offence against the evenness of the manners, but much against the unity of the Character.

So that besides the qualities which have their particular place on different occasions, there must be one to have place throughout, and to reign over all the others. Without this there is no Character: as would be the case, should a poet give his hero the piety of Æneas, and the courage of Achilles, without considering the severity of the one, and the mildness of the other.

A hero, it is true, may be made as brave as Achilles, as mild or pious as Æneas, and, if one will, as prudent as Ulysses; but it would be a mere chimera to imagine a hero with the particular courage of Achilles, the piety of Æneas, and the prudence of Ulysses at the same time.

The unity of Character is not only to be kept in the hero, and the several other persons of the piece; but also in that of the poem itself: that is, all the characters how opposite soever, must center and reunite in that of the hero; and be so swayed by it, as that this alone may seem to govern throughout the whole. Thus Homer makes wrath prevail throughout the whole Iliad; and artifice and dissimulation throughout the Odyssey: the hero's Character is perceived every where, has its full swing, and is favoured by the similitude of the Characters of some of the other persons. Virgil had a great difficulty to grapple with to preserve his unity: in regard of the direct opposition between the humours of his hero, and those of some other of his persons, as Turnus, Mezentius, Dido, &c. He therefore takes care not to carry those opposite Characters to their full length, but moderates and refrains them: and as that moderation could not flow naturally from the persons themselves; it is produced either by some passion, as in Dido, or some dependance, as in Turnus and Mezentius. To this artifice he adds episodes, accommodated to the general Character, by which he interrupts the particular actions which require an opposite Character.

Claudian's conduct, in this respect, is unpardonable; from the horrible Characters of Pluto and the furies, with all the terrors of hell, he passes to the gaiety and pleasures of the graces, gilded palaces, flowery fields, &c. He has as many different prevailing Characters in his three books, as Homer and Virgil in their sixty.

CHA

CHARACTER is also used for certain visible qualities, which claim respect or reverence to those vested therewith.

The majesty of kings gives them a *Character*, which procures respect from the people. A bishop should sustain his *Character* by learning and solid piety, rather than by worldly lustre, &c. The law of nations secures the *Character* of an ambassador from all insults.

CHARACTER is also used among divines, especially those of the Romish church, for an indelible mark, or impression, which certain sacraments are supposed to leave behind them in those who receive them.

The sacraments that leave this *Character*, are incapable of being repeated. The *Character* is generally supposed to be something physical.

It is the sacraments of baptism, confirmation, and ordination, which leave such indelible *Character*.

CHARACTER of a Plant. See **GENUS, CHARACTERISTIC, &c.**

CHARACTERISTIC, in the general, is that which characterizes a thing, or person, *i. e.* constitutes its *Character*, whereby it is distinguished from all others.

CHARACTERISTIC, is peculiarly used in grammar, for the principal letter of a word; which is preserved in most of its tenses, and moods, its derivatives and compounds.

The *Characteristic* frequently shews its etymology; and ought constantly to be retained in its orthography; such is the letter *r* in course, fort, &c.

The *Characteristics* are of great use in the Greek grammar, especially in the formation of the tenses; as being the same in the same tenses of all verbs of the same conjugation, excepting in the present tense, which has several *Characteristics*; and the future, the Aoristus primus, the preterfect, and the pluperfect tense of the fourth conjugation, which have two *Characteristics*.

CHARACTERISTIC of a Logarithm, is its index, or exponent. See **INDEX and LOGARITHM**.

CHARACTERISTIC Triangle of a Curve, in the higher geometry, is a rectilinear right-angled triangle, whose hypotenuse makes a part of the curve, not sensibly different from a right line. It is so called, because curve lines are used to be distinguished hereby.

Suppose, *e. gr.* the semiordinate *p m*, (Tab. *Analysis*, fig. 7.) infinitely near another *P M*; then will *P p* be the differential of the abscissa: and letting fall a perpendicular, *M R = P p*, *R m* will be the differential of the semi-ordinate. Draw, therefore, a tangent *T M*; and the infinitely small arch *M m*, will not differ from a right line: consequently *M m R* is a rectilinear right-angled triangle; and constitutes the *Characteristic triangle* of that curve.

CHARAG, the tribute which Christians and Jews pay to the grand signior.

It consists of ten, twelve, or fifteen francs *per ann.* according to the estate of the party. Men begin to pay it at nine or at sixteen years old; women are dispensed with, as also priests, rabbins, and religious.

CHARCOAL, a sort of artificial coal, or fuel, consisting of wood half burnt; chiefly used where a clear strong fire, without smoke, is required; the humidity of the wood being here mostly dissipated, and exhaled in the fire wherein it was prepared.

The microscope discovers a surprising number of pores in *Charcoal*: they are disposed in order, and traverse it length-wise: so that there is no piece of *Charcoal*, how long soever, but may be easily blown thorough. If a piece be broke pretty short, it may be seen through with a microscope. In a range the 18th part of an inch long, Dr. Hook reckoned one hundred and fifty pores; whence he concludes, that in a *Charcoal* of an inch diameter, there are not less than five millions, seven hundred twenty-four thousand pores.

It is to this prodigious number of pores, that the blackness of *Charcoal* is owing: for the rays of light striking on the *Charcoal*, are received and absorbed in its pores, instead of being reflected; whence the body must of necessity appear black: blackness in a body being no more than a want of reflexion.

Charcoal was antiently used to distinguish the bounds of estates and inheritances, as being supposed incorruptible, when let very deep within the ground. In effect, it preserves itself so long, that there are many pieces found entire in the antient tombs of the northern nations.

M. Dodart says, there is sometimes found *Charcoal* made of corn, probably as old as the days of Cæsar: he adds, that it has kept so well, that the wheat may be still distinguished from the rye; which he looks on as a proof of its incorruptibility.

Method of making CHARCOAL.—The best is that made of oak, cut into lengths of about three foot. The ground whereon the operation is to be performed, is bared of all the turf, and other combustible matter; and is in form circular, a stake being driven in the center. This area is filled up with wood, eight foot high, placed alternately lengthwise, and perpendicularly; then coped atop in the form of a sugarloaf, and all inequalities filled up with small wood, till it lie very close: the whole is then to be covered over moderately thick with turf, and other rubbish.

CHA

A moveable skreen being then set up against the wind; the stake is pulled up, and fire set to the pile, by pouring into the cavity some *Charcoal* and other coal fully kindled; the vent, or tunnel a-top, is then covered with turf, and vent-holes are made through the stuff that covers the pile, two or three foot apart, quite round, a foot from the top. The next day a new range of holes is made, a foot and a half below the first; and thus on to the bottom: observing, that as the pile cools, and sinks to the center, it must be continually fed with short wood, that no part remain unfired; and that if any part chars faster than other, the vent-holes there are to be stopped up.

A parcel is thus burnt in five or six days: as it cools, the smoke grows thinner and bluer. The heap requires two or three days to cool; which is promoted by stopping the vents, and flipping off the covering by degrees, about a yard at a time; at first only taking off the coarsest part and leaving the rest; that the pile may neither cool too fast, nor endanger the reduction of the whole into ashes. Lastly, the coals are taken out from around the bottom, by which means the whole mass, coals and rubbish, sinks down, and extinguishes the fire at once.

Charcoal for powder-mills, is usually made of elder-wood; the process the same, but is finished in two days.

CHARDS, in gardening.—The *Chards* of artichokes, are the leaves of good artichoke plants, tied and wrapped up, all over but the top, in straw, during the autumn and winter; this makes them grow white, and lose some of their bitterness.

CHARDS of Beets, are white beets, covered with dry dung, during the winter season, when they produce large tops, with a downy cotton shoot; which is the true *Chard*, to be used in pottages, intermisses, &c.

CHARGE, in gunnery, the load of a piece; or the quantity of powder and ball, or shot, wherewith it is to be prepared for execution.

The rules for *charging* large pieces in war, are, that the piece be first cleaned or scoured within side; that the proper quantity of gunpowder be next driven in and rammed down; care, however, being taken, that the powder be not bruised in ramming, for that weakens its effect; that a little quantity of paper, hay, or the like, be rammed over it, and that then the ball, or shot be intruded.

If the ball be red-hot, a tampon, or trencher of green wood, is to be driven in before it.

The weight of gunpowder necessary for a *Charge*, is commonly in a subduple proportion to that of the ball. See **CANNON**.

CHARGE, in heraldry, is apply'd to any figure, or thing, bore, or represented in an escutcheon, or coat of arms; whether it be animal, vegetable, or other matter.

Too many *Charges* are not deemed so honourable as fewer.

Charges peculiar to the art and usage of armory, as the cross, chief, pale fesse, &c. are called *proper Charges*; and frequently *Ordinaries*.

Bloom restrains the term *Charges* to those additions, or rewards of honours frequently placed on escutcheons; as cantons, quarters, girons, flasks, &c.

CHARGE, in the manage, a sort of unguent, made of oil, honey, grease, turpentine, and sometimes of lees of wine, and other matters, apply'd externally to a horse, &c. for the cure of strains, bruises, and swellings.

CHARGE, or rather *Overcharge*, in painting, is an exaggerated representation of any person; wherein the likeness is preserved, but, withal, ridiculed.

Few painters have the genius necessary to succeed in these *Charges*: The method is, to pick out and heighten something already amis in the face, whether by way of defect, or redundancy: Thus, *v. g.* if nature have given a man a nose a little larger than ordinary, the painter falls in with her, and makes the nose extravagantly long: or if the nose be naturally too short, in the painting it shall be a mere stump; and thus of the other parts.

CHARGE of Lead, is thirty-six pigs. See **LEAD, &c.**

CHARGED, in heraldry. A shield, carrying on it some figure or impress, is said to be *charged* therewith.

So, also, when one bearing, or *charge*, has another figure added upon it, it is properly said to be *Charged*.

CHARIENTISMUS, in rhetoric, a figure wherein a taunting expression is softened by a jest.

CHAR, } See **CARR.**
CHARIOT, } See **COACH.**

CHARISTIA*, a family feast celebrated among the Romans, on the 11th of the calends of March; *i. e.* on the 19th of February; in honour of the goddess *Comcord*.

* The word comes from the Greek *χάρις*, grace, favour; *q. d.* a day of reconciliation, or of restoring into favour. It was also called *die charæ cognationis*. Vigenere, on Livy, calls it the day of good cheer.

The *Charistia* were instituted to re-establish peace and amity, in families embroiled, or at variance among themselves. It consisted in a great entertainment made in each family, to which no strangers were admitted, but only relations and kindred. The joy and

and freedom inspired by the repast, was looked upon as a proper means to re-unite divided minds; to which the good offices of so many friends would greatly contribute.

CHARISTICARY, *Comendatory*, or *Donatary*, a person to whom is given the enjoyment of the revenues of a monastery, hospital, or benefice.

The *Charisticaries* among the Greeks, were a kind of donataries, or commendataries, who enjoyed all the revenues of hospitals and monasteries, without giving an account thereof to any person.—The original of this abuse is referred to the Iconoclastæ, particularly Constantine Copronymus, the avowed enemy of the monks, whose monasteries he gave away to strangers.

In after times, the emperors and patriarchs gave many to people of quality, not by way of gift, to reap any temporal advantage from them; but to repair, beautify, and patronize them. At length avarice crept in, and those in good condition were given, especially such as were rich; and at last they were all given away, rich and poor, those of men and of women; and that to laymen and merry'd men.

M. Coutelier, in his *ecclésiæ Græcæ monumenta*, gives us the form of these donations: They were granted for life, and sometimes for two lives. See **ABBOT**.

CHARITATIVE, in the canon law. A *charitative Aid*, or *Subsidy*, is a moderate allowance which a council grants a bishop upon any urgent occasion; e. g. when his revenues will not bear his expences to a council, &c.

CHARITY, one of the three grand theological virtues, consisting in the love of God, and our neighbour.

Charity is the habit, or disposition of loving God with all our heart, and our neighbour as ourselves. It has two material objects, therefore, as the school expresses it, viz. God, and our neighbour.

CHARITY is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, assistance, or the like.

CHARITY SCHOOLS, are schools erected and maintained in various parishes, by the voluntary contributions of the inhabitants, for teaching poor children to read, write, and other necessary parts of education.

In most *Charity Schools*, the children are likewise clothed and put out to trades, services, &c. on the same charitable foundation.

Charity Schools are but of a few years standing: They were began in London; and have since spread throughout most of the considerable towns of England and Wales. In the year 1710, the account of the *Charity Schools* in and about London stood thus.

Number of schools 88.	Of boys taught therein 2181.	Of girls 1221.
Boys clothed 1863½	Girls 1114½	In all 2977.
Boys not clothed 373½	Girls 128½	In all 501.

Note, Out of the whole, 967 boys, and 407 girls, had been put out apprentices: but the number is, since that time, vastly increased.

In London we had likewise a **CHARITABLE Corporation** for the relief of the industrious poor, erected under queen Anne; for enabling indigent manufacturers and traders to take up money at common and legal interest; there being a sum of 30000 l. raised for that end.

Order of CHARITY. There are several religious orders which bear this title: one instituted by St. John de Dieu, for the assistance of the sick: This institute was approved of in 1520, by Leo X, and confirmed by Paul V. in 1617. The religious of this order apply themselves wholly to the service of the diseased.

CHARITY of the holy Virgin, is a religious order established in the diocese of Chalons, by Guy lord Joinville, &c. towards the close of the thirteenth century, approved under the rule of St. Augustine, by the popes Boniface VIII. and Clement VI.

In each parish of Paris, there is a society of women, who apply themselves to find out and relieve the wants of the poor of the parish; and on this account called, *Dames de la Charité*, and *Sœurs de la Charité*.

CHARKING, or **CHARRING**, the burning of wood to make charcoal. See **CHARCOAL**.

CHARKS, pit-coal charked or char'd. See **COAL**.

CHARLATAN*, or **CHARLETAN**, an empiric, or quack, who retails his medicines on a publick stage, and draws the people about him with his buffooneries, feats of activity, &c. See **EMPIRIC**.

* The word, according to Calepine, comes from the Italian *Charlatan*; of *Carriano*, a town near Spoleto in Italy, where these impostors are said to have first risen. Menage derives it from *Charlatano*, and that from *Circulatorius*, of *Circulator*, a quack.

CHARLESS-WAIN, in astronomy, seven stars in the constellation *Ursa Minor*.

CHARM*, a magic power, or spell, by which, with the assistance of the devil, forcerers and witches are supposed to do wondrous things, far surpassing the powers of nature. See **MAGIC**.

* The word comes from the latin *Carmen*, verse.

Philacteries, ligatures, &c. are all kinds of *Charms*.

We have the history of a notable *Charm*, wherewith great

Vol. L

things are pretended to have been done in the way of poisoning, and tormenting; described by a famous forcerer, one Brafs de Forthen, while under sentence of death in France, as follows.

It consists of a new earthen pan, varnished, not bought nor bargained for; wherein is put sheep's blood, wool, hair of several beasts, with poisonous herbs, mixed together with a great deal of grimace, and superstitious ceremonies, uttering certain words, and invoking devils. This pan is put in a secret place in the neighbourhood where the mischief is to be done, and sprinkled with vinegar, according to the effect it is to produce. The *Charm* holds a certain time, and cannot be taken away, but either by the party that lodged it, or some superior power which overcomes it; but these things are now sufficiently exploded.

CHARNEL, a portico, or gallery, antiently near the church-yard; over which were disposed the bones of the dead, when the flesh was consumed.

The *Charnels*, or *Charnel-Houses*, are now usually contiguous to the church.

CHART, or *Sea-CHART*, a hydrographical map; or a projection of some part of the sea, in plano; for the use of navigation.

The invention of *Sea-charts*, Fournier refers to Henry son of John king of Portugal. They differ very considerably from geographical, or land maps, which are of no use in navigation. Nor are *Sea-Charts* all of the same kind; some being what we call *Plain Charts*, others *Reduced*, or *Mercator's-Charts*, and others *Globular Charts*.

Plain CHARTS, are those wherein the meridians and parallels, are exhibited by right lines, parallel to each other.

These, Ptolemy, in his geography, rejects for the following faults, though their inventor judged them of good use; and experience has confirm'd his judgment; especially in short voyages. Their defects are, 1. That since in reality all the meridians meet in the poles; it is absurd to represent them, especially in large *Charts*, by parallel right lines. 2. That *Plain Charts* exhibit the degrees of the several parallels, equal to those of the equator; and of consequence the distances of places lying east and west, much larger than they should be. And 3. In a *Plain Chart*, while the same rhumb is kept, the vessel appears to sail in a great circle; which yet is false.

But notwithstanding these defects in the *Plain Chart*, yet the easiness of its application has so reconciled it to the mariners, that it is used almost alone; in exclusion of the more accurate ones.

Construction of a Plain CHART.—1. Draw a right line, as A B, (Tab. *Hydrography*, fig. 9.) and divide it into as many equal parts, as there are degrees of latitude in the portion of the sea to be represented. 2. Add another to it at right angles B C, divided into as many parts, and those equal to one another, and to the former, as there are degrees of longitude in the portion of the sea to be represented. 3. Complete the parallelogram A B C D, and resolve its area into little squares; then right lines, parallel to A B and C D, will be meridians; and those parallel to A D and B C parallels. 4. The coasts, islands, bays, sands, rocks, &c. infer from a table of longitudes and latitudes, in the same manner as is laid down under **MAP**.

Hence, 1. the latitude and longitude of a ship being given, her place is easily exhibited in the *Chart*. 2. The places F and G, to and from which the ship sails, being given in a map, the right line F G, drawn from the one to the other, makes, with the meridian A B, an angle A F G, equal to the inclination of the rhumb: And since the parts F 1, 1 2, 2 G, intercepted between equidistant parallels, are equal; and the inclination of the right line F G, to all the meridians or right lines parallel to A B, is the same; the right line F G truly represents the rhumb. After the same manner it may be shewn, that this *Chart* exhibits *latus mecdynamicum*, or miles of longitude truly.

It follows, that *Plain Charts* may be used to very good purpose in directing a ship; provided care be taken there escape no error in the distance of the places F and G.

Construction of a scale to correct the errors of the distances in Plain CHARTS.—1. Upon the right line A B, (fig. 10.) from the map transfer five degrees, and divide them into 300 equal parts, or geographical miles. 2. On this describe a small circle A C B, to be divided into 90 equal parts: If then it be desired to know how many miles make five degrees in the parallel fifty; in the compasses take the interval fifty, and transfer it on to the diameter A B; the number of miles required will here be shewn. It follows, that if a ship sail on an eastern or western rhumb, out of the equator; the miles answering to the degrees of longitude will be found as in the preceding article. If it sail on any collateral rhumb, still the sailing is supposed to be an eastern or western rhumb, in an intermediate parallel, between the parallel of the place whence the ship proceeds, and the parallel of the place at which the arrives.

It is true, this reduction, by an arithmetically mean parallel, is not accurate; yet is it frequently used in practice, as being accommodated to the apprehensions of the generality of mariners. In effect, it does not err any thing considerable, if the whole course be divided into parts, whereof each does not exceed one degree; whence it appears advisable, not to take the diameter of the semicircle A B above one degree, and to divide it at most into geographical miles.

For the application of the Plain CHART in sailing. See Plain SAILING.

Reduced CHART, or **CHART of Reduction**, is that wherein the meridians are represented by right lines converging towards the poles; and the parallels by right lines parallel to one another, but unequal. These, therefore, it appears by their construction, must correct the errors of the *Plain Charts*.

But since the parallels should cut the meridians at right angles; these *Charts* are defective, inasmuch as they exhibit the parallels inclined to the meridians.

Hence another kind of *Reduced Charts* has been invented, wherein the meridians are parallel, but the degrees thereof unequal; these are called *Mercator's Charts*.

Mercator's CHART, is that wherein the meridians and parallels are represented by parallel right lines; but the degrees of the meridians are unequal; still increasing, as they approach the pole, in the same proportion as those of the parallels decrease: By means whereof, the same proportion is preserved between them as on the globe.

This *Chart* has its name from that of the author who first proposed it for use, and made the first *Chart* of this projection, *N. Mercator*: But neither was the thought originally his own, as having been hinted by Ptolemy near 2000 years ago: Nor is the perfection of it owing to him; our countryman Mr. Wright being the first who demonstrated it, and shewed a ready way of constructing it, by enlarging the meridian line by the continual addition of secants.

Construction of Mercator's CHART.—I. Draw a right line, and divide it into equal parts, representing degrees of longitude either in the equator, or in the parallel wherein the *Chart* is to terminate. From the several points of division erect perpendiculars to represent meridians; so as right lines may cut them all under the same angle, and therefore represent rhumbs: Thus far as in the *Plain Chart*.

That the degrees of the meridians may have their just proportion to those of the parallels, the former are to be increased; in regard the latter continue the same, by reason of the parallelism of the meridians.

With the interval therefore of one degree in the equator CD, (Tab. *Hyd.* fig. 11.) describe the quadrant CDE, and in D erect a perpendicular DG; make the arch DL equal to the parallel of latitude, and through L draw CG: This CG will be the enlarged degree of the meridian, to be transferred to the meridian of the *Chart*: The rest as in *Plain Charts*.

In practice, suppose it required to draw a *Mercator's Chart* from the fortieth degree of north-latitude to the fiftieth, and from the sixth degree of longitude to the eighteenth. First draw a right line representing the fortieth parallel of the equator; which divide into 12 equal parts, for the 12 degrees of longitude the *Chart* is to contain. Then take a line of equal parts, on a scale whereof 100 parts are equal to each of these degrees of longitude; and at each extreme of the line raise two perpendiculars, to represent two parallel meridians to be divided by the continual addition of secants, which are proved to increase in the same proportion, as the degrees of longitude should decrease.

Thus, for the distance from forty degrees of latitude, take $131\frac{1}{2}$ equal parts, from the scale which is the secant of forty degrees thirty min. For the distance from forty-one deg. to forty-two deg. take $133\frac{1}{2}$ equal parts, from the scale which is the secant of forty-one deg. thirty min. and so on to the last degree of your *Chart*, which will be 154 equal parts, viz. the secant of forty-nine deg. thirty min. and will give the distance from forty-nine deg. of latitude to fifty deg. By this means, the degrees of latitude will be augmented, in the same proportion as the degrees of longitude on the globe decrease.

The meridians being divided, add the card, or compass; choosing some convenient place near the middle thereof: from this draw a line parallel to the divided meridians, which will be the north rhumb; and from this the other thirty-one points of the compass are to be set off.

Lastly, lay down the towns, ports, islands, coasts, &c. from a table of longitudes and latitudes; and the *Chart* is complete. In *Mercator's Chart*, the scale changes as the latitude is changed: if then, v.g. a ship sails between the fortieth and fiftieth parallels of latitude, the degrees of the meridians between those two parallels, are to be the scale for measuring the ship's way: whence it follows, that though the degrees of longitude be equal in extent on the *Chart*, yet they must contain unequal numbers of miles, or leagues; and that they will decrease as they approach nearer the pole, because measured by a magnitude continually increasing. This *Chart* is demonstratively true; though to appearance false: it is found by experience very accurate, and withal very easy of application. In effect, it has all the qualifications required to render it of service in navigation; yet do the generality of mariners decline the use of it, and rather chuse to keep the old erroneous *Plain Chart*.

For the use of *Mercator's CHART* in sailing. See *Mercator's SAILING*.

Globular CHART, is a projection so called, from the conformity it bears to the *Globe* itself; this has been since the others proposed to the world by Messrs. Senex, Wilton, and Harris; wherein the meridians are inclined; the parallels equidistant

and curvilinear; and the rhumbs real spirals, as on the surface of the globe.

We might be expected to expect something from this, as it came out under the protection of his majesty's patent, and with the recommendation of several able navigators, and among others, that of Dr. Halley; and as it has now stood the test of a pretty severe inquisition. We shall only add, that the projection is perfectly agreeable to nature, and therefore easily conceivable; and that it has been found to answer very exactly, even in very large distances; where its failure, if it have any, must needs be most conspicuous.

CHARTS composed by rhumbs and distances, are those wherein there are no meridians or parallels; but all is effected by the rhumbs, and the scale of miles.

These are chiefly used by the French, and especially in the Mediterranean.

They are patched up, without any great art, from the observations of the mariners; any regular account therefore how to make them would be needless. They are only used in short voyages.

CHARTA primarily signifies a sort of paper made of the plant *Papyrus*, or *Biblus*. See *PAPER*.

CHARTA Emporetica, in pharmacy, &c. a kind of paper made very soft and porous, and used to filter withal.

CHARTA is also used in our antient customs for a *Charter*, or deed in writing. See *CHARTER*.

CHARTA de Foresta. See *CHARTER of the Forest*.

CHARTA Magna, the great *Charter*, is an antient instrument, containing several privileges and liberties granted to the church and state, by Edward the confessor, together with others relating to the feudal laws of William the conqueror, granted by Henry I. all confirmed by the succeeding princes about thirty times. See *MAGNA CHARTA*.

CHARTA Pardonationis si defendendo, is the form of a pardon for killing another man in his own defence.

CHARTA Pardonationis Utlagarie, is the form of pardon of a man who is outlawed.

CHARTA Simplex, is a single deed, or deed-pole. See *DEED*.

CHARTEL. See the article *CARTEL*, *COMBAT*, *DUEL*, *CHAMPION*, &c.

CHARTER *, **CHARTA**, an instrument, or written evidence of a thing under the seal of a prince, lord, church, chapter, or community.

* The word *Charter* comes from the latin *Carta*, antiently used for a publick or authentick act, a donation, contract, or the like, from the Greek *χαρτης*, *thick paper*, or *passboard*, whereon publick acts were used to be wrote.

Bracton says, donations are sometimes made in *Charters*, in *perpetuum rei memoriam*.—He adds, that of *Charters* some are royal, others of private persons.

Of royal, some are private, some common, some universal.

Of private *Charters*, some are *de puro feoffamento*, others *de conditionali feoffamento*, others of recognition, pure or conditional, others of confirmation, &c.

CHARTER of the Forest, is that wherein the laws of the forest are comprized and established, together with the *Magna Charta*, or *Great Charter*. See *FOREST*.

Great CHARTER, *Magna Charta*. See *MAGNA CHARTA*.

CHARTERS of the King, are those whereby a king makes a grant to a person, or community; v.g. a *Charter of Exemption*, that a person should not be impannelled on a jury, &c.

CHARTER of Pardon, is that whereby a person is forgiven a felony, or other offence against the king's crown and dignity. See *PARDON*.

CHARTER-HOUSE. See the article *CHARTREUSE*.

CHARTER-LAND, in law, is such as a man holds by *Charter*, that is, by evidence in writing; otherwise called *Freehold*. See *FREEHOLD*.

This the Saxons called *Bockland*: which Lambard renders, *terra ex scripto*.

It was held on more easy conditions than the *Folkland*, or *terra sine scriptis*, held without writing: the former being *hereditaria libera & immunis*; whereas the latter *consensu penitus ab annuo atque officiorum quadam servitute erat obligatus*.

CHARTERPARTY, in commerce, denotes the instrument of freightage; or articles of agreement for the hire of a vessel.

The *Charterparty* is to be in writing; and is to be signed both by the proprietor, or the master of the ship; and the merchant who freights it.

The *Charterparty* is to contain the name and the burden of the vessel; those of the master and the freighter; the price or rate of freight; the time of loading and unloading; and the other conditions agreed on.

It is properly a deed, or policy, whereby the master or proprietor of the vessel engages to furnish immediately a tight sound vessel, well equipped, caulked and stopp'd, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship, with all its furniture, and the cargo, are respectively

ively subjected to the conditions of the *Charterparty*.

The *Charterparty* differs from a *bill of lading*, in that the first is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, or at most only for the voyage one way.

The president Boyer lays, the word comes from hence, that *per medium charta incidebatur, & sic fiebat charta partita*; because in the time when notaries were less common, there was only one instrument made for both parties: this they cut in two, and gave each his portion, and joined them together at their return, to know if each had done his part. This he observes to have been practised in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a staff, each party retaining a moiety thereof as a mark.

CHARTIS *Reddendis*, a writ which lies against him that has *Charters* of feoffment intrusted to his keeping, and refuseth to deliver them to the owner.

CHARTOPHYLAX*, an officer in the church of Constantinople, intrusted with the custody of the archives.

* The word is formed from *χαρτα*, and *φυλαξω*, *custodio*; and signifies *Charter keeper*.

Codin calls the *grand Chartophylax* the judge of all causes, and the right arm of the patriarch. He adds, that he was the depositary or keeper of all the *Charters* relating to the ecclesiastical rights; and that he presided over matrimonial causes, and was judge of all the clergy. He drew up all sentences and decisions of the patriarch, who signed and sealed them; he presided in the grand council of the patriarch; he took cognizance of all matters and causes ecclesiastical and civil, whether among the clergy, the monks, or the people.

He took place of all the bishops; though himself only a deacon; and, on occasion, discharged the functions of the priests: he had twelve notaries under him.

The *Chartophylax* was much the same at Constantinople with the *Charitulary* at Rome.

There were, in reality, two officers who bore this title; the one for the court, the other for the patriarch; the first was called also *Registrator*, and the latter *Scriniarius*: though the two are usually confounded together. Leunclavius, and others, confound *Chartophylax* with *Charitulary*.

CHARTREUSE, a celebrated monastery of Carthusians; so called from the name of a steep rocky place, in a frightful desert five leagues from Grenoble in France; where S. Bruno retired from the world, and first instituted the order of Carthusians. The name has since passed to all houses of Carthusians; and that near Grenoble, is now distinguished by the name of the *great Chartreuse*.

That of London, corruptly called *Charter-house*, is now converted into a college, called also from its founder Sutton's *hospital*; first endowed, with 4000 *l. per ann.* since improved to 6000 *l.* It is to consist of decayed gentlemen, soldiers, and merchants; eighty of whom have a plentiful maintenance of diet, lodgings, clothes, physick, &c. living together in a collegiate manner; and of scholars, or youths, forty-four of whom are taught, and supplied with necessaries, and such of them as are fit for the university sent thither, with an exhibition of 20*l. per ann.* for eight years; the rest are put to trades.

For the superintendency of this hospital there are sixteen governors, generally of the prime quality: vacancies being supplied by the election of the remaining governors. The ordinary officers are, a master, preacher, register, treasurer, school-master, &c.

CHARTREUX, religious of the order of S. Bruno, called also Carthusians. See **CARTHUSIANS**.

CHARTULARY, **CHARTULARIUS**, a title given to an antient officer in the Latin church, who had the care of *Charters* and papers relating to publick affairs.

The *Chartulary* presided in ecclesiastical judgments, in lieu of the pope.

In the Greek church, the *Chartulary* was called *Chartophylax*; but his office was there much more considerable; and some even distinguish the *Chartulary* from the *Chartophylax* in the Greek church. See **CHARTOPHYLAX**.

CHASE, or **CHACE**, in law, is used for a driving of cattle to, or from any place; as to a distress, a forelet, &c.

CHASE, or **CHACE**, is also a place of retreat for deer and wild beasts; of a middle kind, between a forest and a park; being usually less than a forest, and not possessed of so many privileges; but wanting, *v.g.* courts of attachment, swanimote, and justice seat.

Yet is it of a larger extent, and stocked both with a greater diversity of wild beasts, or game, and more keepers, than a park. Crompton observes, that a forest cannot be in the hands of a subject, but it forthwith loses its name, and becomes a *Chase*; in regard, all those courts lose their nature when they come into the hands of a subject; and that none but the king can make a lord chief justice in eyre of the forest.

Yet the same author adds, that a forest may be granted by the king to a subject, in so ample a manner, as that there may be courts equivalent to a court of attachment, swanimote, and justice seat.

CHASE, in the sea language, is to pursue a ship; which is called also *giving Chase*.

Stern CHASE, is when the chaser follows the chased a-stern, directly upon the same point of the compass.

To lie with a ship's fore-foot in a *Chase*, is to sail, and meet with her by the nearest distance, and so to cross her in her way, or to come a-cross her fore-foot.

A ship is said to have a *good Chase*, when she is so built forward on, or a-stern, that she can carry many guns to shoot forwards or backwards; according to which she is said to have a *good forward*, or *good stern Chase*.

CHASE-Guns, are such whose ports are either in the head (and then they are used in chasing of others) or in the stern, which are only useful when they are pursued or chased by any other ship.

CHASE of a Gun, is the whole bore, or length of a piece taken within-side. See **CANNON**.

CHASING, a method of working, or enriching gold, silver, &c. properly called *enchasing*. See **ENCHASING**.

CHASM, *Xaſm*. See the articles **GROTTO** and **HIATUS**.

CHATELET*, antiently signified a little castle, or fortress, where in the *Chatelain*, or governor lodged. See **CASTLE**.

* The word is a diminutive of *chateau*, formed from *castrum*, a diminutive of *castrum*; or from *castelletum*, a diminutive of *castrum*, castle.

At present, the term is used for certain courts of justice established in several cities in France: the *grand Chatelet* in Paris, *v.g.* is the place where the prefdial, or ordinary court of justice of the prevot of Paris is kept; consisting of a prefdial, a civil chamber, criminal chamber, and a chamber of policy. The term signifies the same at Montpellier, Orleans, &c.

The little *Chatelet* at Paris, is an antient fort, now serving as a prison.

CHATELS*, **CATALIS**, **CATALIA**, a Norman term, under which were antiently comprehended all moveable goods; those immoveable being termed *fiefs*, or, as we now say, *fee*.

* Spelman defines *Chattels* to be *bona quaecunque mobilia & immobilia; propriè tamen a bonorum pars, quæ in animalibus consistit, à quorum capitibus rei ipsæ, alia capita, alia capitalia distat*.

CHATELS, in the modern sense of the word, are all sorts of goods, moveable or immoveable, except such as are in the nature of freehold, or parcel thereof.

Chattels are either *personal*, or *real*.

CHATELS Personal, are such as do either belong immediately to the person of a man, as his horse, sword, &c. or such things as being injuriously withheld from him, a man has no way to recover but by personal action. See **PERSONAL**.

CHATELS Real, are either such as do not appertain immediately to the person, but to some other thing, by way of dependance; as charters of land, apples upon a tree, &c. or such as necessarily issue out of some immoveable thing to a person; as a lease, or rent for years.

CHAUNTOR, or **CHAUNTER**. See **CHANTOR**.

CHAUNTRY, or **CHANTRY**, was antiently a church, or chapel endowed with lands, or other yearly revenue, for the maintenance of one, or more priests, daily saying, or singing mass for the souls of the donors, and such others as they appointed.

Hence **CHAUNTRY-Rents**, are rents paid to the crown by the tenants, or purchasers of *Chauntry-Lands*.

CHAUFFE-WAX. } See { **CHAFE-WAX**.

CHAUSSE-TRAPE. } See { **CALTROP**, and **CROWSFEET**.

CHAZINZARIANS*, a sect of hereticks, who rose in Armenia in the seventh century.

* The word is formed of the Armenian, *chazai*, cross. In the Greek text of Nicephorus, they are called *Chazintzarians*, *χαζιντζαριαν*.

They are also called *flaurolatæ*, which, in Greek, signifies the same as *chazinzarians* in Armenian, *viz.* adorers of the cross; they being charged with paying adoration to the cross alone.

In other respects they were Nestorians; and admitted two persons in Jesus Christ. Nicephorus, l. xviii. c. 54. ascribes other singularities to them, particularly their holding an annual feast, in memory of the dog of their false prophet Sergius; which they called *artzeibartzes*.

CHECK-Roll, a roll, or book containing the names of such as are attendants, and in pay to the king, or other great persons; as their household servants.

It is otherwise called the *chequer-roll*. See **ROLL**.

Clerk of the CHECK, in the king's household, has the *Check* and controulment of the yeomen of the guard, and all the officers belonging to the royal family; allowing their absence or defects in attendance, or diminishing their wages for the same, &c.—He also, by himself or deputy, takes the view of those that are to watch in the court, and has the setting of the watch. 33H.8.c.12.

Clerk of the CHECK, in the king's navy at Plymouth, is also the name of an officer invested with like powers. 19 Car. 2. c. 1.

CHECK, in falconry, is where a hawk forsakes her proper game, to follow rooks, pies, or other birds that cross her in her flight.

CHECKER. See the article **EXCHEQUER**.

CHECKY, in heraldry, is where the shield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers, or squares.—See *Tab. Heraldry*, fig. 15.

Where there is but one row of squares, it is not properly called *checky*, but *countercompounded*.

Checky, according to Colombiere, is one of the most noble and antient figures in all armory; and ought never to be given, but

to persons who have distinguished themselves in war: for it represents a chess-board, which it self is a representation of a field of battle. The pawns and men, placed on both sides, represent the soldiers of the two armies; which move, attack, advance, or retire, according to the will of the two gamesters, who are the generals.

Chessy is always composed of metal, and colour. Some authors however would have it ranked among the sorts of furs.

When the whole escutcheon is chequered, it should ordinarily contain six ranges: there is no need of blazoning to express them; only it must be observed, to begin to blazon by the first square in chief on the dexter-side. So that if that be *or*, and the next *gules*, the house or family is said to bear *chessy, or, and gules*.

When the whole shield is not chequered, but only the chief, a bend, cross, or the like, the number of ranges should be expressed. **CHEEKS**, a general name among mechanicks, for almost all those pieces of their machines and instruments, that are double, and perfectly alike.

The *Cheeks of a printing-press*, are its two principal pieces: they are placed perpendicular, and parallel to each other; serving to sustain the three fommers, *viz.* the head, shelve, and winter, and to bear the spindle, and other parts of the machine.

The *Cheeks of a turner's Lathe*, are two long pieces of wood, between which are placed the *puppets*, which are either pointed; or otherwise; serving to support the work, and the mandrils of the workman. These two pieces are placed parallel to the horizon, separated from one another by the thickness of the tail of the puppets, and joined with tenons to two other pieces of wood, placed perpendicularly; called the *legs of the lathe*.

Cheeks of the glazier's vice, are two pieces of iron, joined parallel at top and bottom; in which are the axis, or spindles, little wheel, cushions, &c. whereof the machine is composed.

CHEESE, a popular food; being a preparation of milk curdled by means of rennet, and afterwards dried, and hardened. *Cheese* is nothing but milk purged of its serum, or whey; and sometimes too of the cream, or butyrous part of the milk. *Cheese*, when new, is found to load the stomach, by reason of its moisture and viscosity; and when too old, it heats and inflames it by its salts. The physicians advise it to be eat in small quantities; hence that Latin verse,

Cafeus ille bonus quem dat avara manus.

Dr. Quincy says, it cannot be too old: it is certain, the more it abounds with salts, the more will it contribute to digestion, and the clearing of the stomach of other food.

Indeed some condemn all use of *Cheese*; sheltering themselves under that antient maxim, *Cafeus est nequam quia concoquit omnia squama.*

CHEF. See the article **CHIEF**.

CHEF d'Oeuvre. See the article **MASTERPIECE**.

CHELIDONIUS*, in natural history, a stone pretended to be found in the stomachs of young swallows; much esteemed by some for the falling sickness.

* The word is formed from the Greek *χελιδων*, a swallow. See Supplement, article **CHELIDONIUS**.

CHELONITES*, a stone said to be found in the Indian tortoises, and said to have the faculty of resisting poison.

* The word is formed from the Greek *χελων*, a tortoise.

Some confound the *Chelonites* with the *bunonites*, or *toadstones*. See Supplement, article **CHELONITES**.

CHELSEY-College, or hospital. See **HOSPITAL**.

CHEMISE, in fortification, a wall wherewith a bastion, or ditch is lined, for its greater support and strength.

Fire CHEMISE, is a piece of linen cloth, steeped in a composition of oil of petrol, camphor, and other combustible matters; used at sea, to set fire to an enemy's vessel.

CHEQ. or **CHERIF**, the prince, or high-priest of Mecca; sovereign pontiff of the Mussulmans; and owned as such by all the sects into which they are divided.

The grand signior, sophies, mogols, kans of Tartary, &c. send him yearly presents; especially tapestry, to cover Mahomet's tomb withal, and tents for himself: for the *Cheq* has a tent near the mosque of Mecca, wherein he lives during the seventeen days of devotion in pilgrimage to Mecca. The tapestry and tent are changed each year, and pieces thereof are sent to the princes who furnish new ones.

His revenue is very considerable, consisting of presents made by the Mahometan princes, and pilgrims, to the mosque of Mecca and Medina.

The *Cheq* subsists all the pilgrims during the seventeen days of devotion; on which account, he is every year furnished with a very considerable sum of money from the grand signior: the better to obtain this, he makes him believe, that there are constantly, during this time, seventy thousand pilgrims; and that, should the number fall short, the angels, in form of men, would make it up.

CHERRY-Brandy, a drink made of Brandy, with the addition of *Cherries*.

The *Cherries* commonly used therein, are of the black kind; with these, a bottle being half filled, is filled up with Brandy, or spirits. The whole is to be shaken up now and then; and in a month's time it becomes fit for use.

To sweeten it, and improve the flavour, some chuse to put in Sugar, with a quantity of raspberries.

CHERSONESUS*, in geography, a peninsula; or a continent almost encompassed round with the sea, only joining to the main land by a narrow neck, or isthmus.

* The word is Greek, *χερσωνος*, which signifies the same.

This term is used by the moderns, in complaisance to the antients, who called all their peninsulas by this name: accordingly, such places as were hereby distinguished among them, retain the name among us; as the *Cherjonesus* of Peloponnesus, of Thrace, *Cherjonesus cimbrica*, *aurea*, &c.

CHERUB*, or **CHERUBIN**, a celestial spirit, which, in the hierarchy, is placed next in order to the seraphim. See **HIERARCHY**.

* The word is formed of the Hebrew *כרוב* *Cherub*; the plural whereof is *Cherubim*.

They are painted red, to signify that they are inflamed with the love of God.

CHERUBIN was also the name of an antient military order in Sweden, otherwise called the order of seraphim. It was instituted by Magnus IV. in 1334; and abolished by Charles IX. It took its denomination from the golden figures of cherubim, whereof the collar of the order was composed.

CHESS*, an ingenious game, performed with little round pieces of wood, on a board divided into sixty-four squares; where art and address are so indispensible requisite, that chance seems to have no place; and a person never loses but by his own fault.—On each side there are eight noble men, and as many pawns, which are to be moved and shifted, according to certain rules and laws of the game.

* Sarasin has a precise treatise on the different opinions of the origin of the Latin *Schacchi* whence the French *Echecs*, and our *Chess*, is formed. Menage is also very full on the same head. Leonclavius takes it to come from the Ufcoches, famous Turkish robbers: P. Sirmond from the German *Schach*, theft; and that from *Calculus*. He takes *Chess* to be the same with the *Ludus Latrunculorum* of the Romans, but mistakenly. This opinion is countenanced by Vossius and Salmassius, who derive the word from *calculus*, as used for *latrunculus*. G. Tolofanus derives it from the Hebrew *Schach*, *vallavit* & *mat mortuus*; whence *Chess* and *Chess-mate*. Fabricius says, a celebrated Persian astronomer, one Schatrenscha, invented the game of *Chess*; and gave it his own name, which it still bears in that country. Nicod derives it from *seque*, or *Reque*, a moorish word for lord, king, and prince: Bochart adds, that *schach* is originally Persian, and that *schachmat*, in that language, signifies the king is dead.—The opinion of Nicod and Bochart, which is likewise that of Scriverius, appears the most probable.

Donatus, on Terence's *Eunuch*, observes, that Pyrrhus, the most knowing and expert prince of his age, ranging a battle, made use of the men at *Chess* to form his designs; and to shew the secrets thereof to others. Vopiscus, in his life of Proculus, informs us, that one of the Roman emperors had the title Augustus given him, because of his gaining ten games at *Chess* successively.

Tamerlane is also recorded as a very expert gamester at *Chess*. *Chess* is doubtless a most antient and universal game: the common opinion is, that it was invented by Palamedes at the siege of Troy. Others attribute the invention to Diomedes, who lived in the time of Alexander: the romance of the role ascribes it to one Attalus; but the truth is, the game is so very antient, there is no tracing its author.

In China, it makes a considerable part of the education of their maids, and seems to take the place of dancing among us. In Spain, whole cities challenge each other at *Chess*.

John of Salisbury relates, that in a battle between the French and English, in 1117, an English knight seizing the bridle of Louis le Gros, and crying to his comrades, *the king is taken*, that prince struck him to the ground with his sword, saying, *Ne seais tu pas qu'aux echecs on ne prend pas le roy?* Dost thou not know, that at *Chess* the king is never taken? The reason is, that when the king is reduced to such a pass that there is no way for him to escape, the game ends, without exposing the royal piece to further affront.

Cardinal Cajetan, and other casuists, rank *Chess* in the number of prohibited games; as requiring too much application: and Montaign blames it as too serious for a game.

CHEST, in commerce, a kind of measure, containing an uncertain quantity of several commodities.

A *Chest of Sugar*, *v. g.* contains from ten to fifteen hundred weight: a *Chest of Glass*, from 200 to 300 foot; of *Cattle-Soap*, from 2½ to three hundred weight; of *Indigo*, from 1½ to two hundred weight; five score to the hundred.

CHEVAGE*, or **CHIEFAGE**, according to Bracton, signifies a tribute by the head; or a kind of poll-money antiently paid by such as held lands in villinage, or otherwise, to their lords, in acknowledgment.

* The word is formed of the French *Chef*, head.

The word seems also to have been used for a sum of money yearly given to a man of power, for his patronage and protection, as to a *Chief*, head, or leader.

In the first sense, Coke observes, there is still a kind of *Chevage* subsisting in Wales, called *Anabry*; paid to the prince of Wales for the marriage of his daughters; antiently by all, now only by some. Lambard writes it *Cbiage*.

The Jews, allowed to live in England, long paid *Chevage*, or poll-money; *viz.* three pence per head: It was paid at Easter.

CHEVAL

CHEVAL de Frise *, a large piece of timber pierced, and traversed with wooden spikes, armed or pointed with iron, five or six foot long.—See *Tab. Fortif. Fig. 15*.

* The term is French, and properly signifies a Friesland horse; as having been first invented in that country.—It is also called a *Turnpike*, or *Tournequet*.

Its use is to defend a passage, stop a breach, or make a retrenchment to stop the cavalry.

It is sometimes also mounted on wheels, with artificial fires, to roll down in an assault.

Ettard observes, that the prince of Orange used to inclose his camp with *Chevaux de Frise*, placing them over one another.

On a medal of Licinius, is found a kind of *Cheval de Frise*, made with spikes interposed; serving to express a fortified camp.

CHEVALIER *, a French term, ordinarily signifying a knight.

* The word is formed of the French *Cheval*, horse; and that of the Latin *caavallus*.

It is used, in heraldry, to signify any Cavalier, or horseman armed at all points; by the Romans called *cataphractus eques*, now out of use, and only to be seen in coat-armour. See *EQUES*.

CHEVELLE, a term used by the French heralds, to express a head where the hair is of a different colour from the rest of the head.

CHEVIN. See the article *FISHING*.

CHEVRON, or **CHEVERON**, in heraldry, one of the honourable ordinaries of a shield; representing two rafters of a house joined together, without any division.

It descends from the chief towards the extremities of the coat, in form of a pair of compasses half open.—Thus, he bears gules, a *Chevron* argent.—*V. Tab. Herald. fig. 16*.

The *Chevron* is the symbol of protection, *fy fonic*; or of constancy according to others: some say it represents the knights spurs; others the head attire of priestesses; others a piece of the lift, or the barrier or fence of a park.

When it is alone, it should take up the third part of the coat: when it is accompanied with any other bearings, its breadth must be adjusted thereby.

It is bore divers ways; sometimes in chief, sometimes in base, sometimes enarched, sometimes reversed, &c.

The *Chevron* is sometimes charged with another *Chevron*, $\frac{1}{2}$ of its own height.

Two *Chevrons* are allowed in the same field, but not more; when they exceed that number, they are called *Chevronwise*, or *Chevronels*. There are *Chevrons* of several pieces.

A *Chevron* is said to be *abased*, when its point does not approach the head of the chief, nor reach farther than the middle of the coat; *mutilated*, when it does not touch the extremes of the coat; *cloven*, when the upper point is taken off, so that the pieces only touch at one of the angles; *broken*, when one branch is separated into two pieces; *couched*, when the point is turned towards one side of the escutcheon; *divided*, when the branches are of several metals, or when metal is opposed to colour; and *inverted*, when the point is towards the point of the coat, and its branches towards the chief.

A coat is said to be *chevroned*, when it is filled with an equal number of *Chevrons*, of colour and metal.

Counterchevroned, is when it is so divided, as that colour is opposed to metal, and *vice versa*.

Per CHEVRON, or *party per CHEVRON*, is when the field is divided by only two fingle lines, rising from the two base points, and meeting in a point above, as the *Chevron* does.

CHEVRONEL, a diminutive of *Chevron*; and as such only containing half a *Chevron*.

CHEVRONNE, or **CHEVRONNY**, signifies the parting of the shield, several times *Chevronwise*. Gibbon says, *Chevronne of six*.

CHIAOUS *, an officer in the grand seignior's court, doing the business of an usher.

* The word, in the original Turkish, signifies envoy.

He bears arms offensive and defensive; and has the care of prisoners of distinction. His badge is a staff covered with silver, and he is armed with a scimitar, bow, and arrows.

The emperor usually chuses one of this rank to send as embassadors to other princes.

The *Chiaus* are under the direction of the *Chiaus-Baschi*, an officer who affixes at the divan, and introduces those who have business there.

CHICANE *, or **CHICANRY**, in law, an abuse of judiciary proceeding, tending to delay the cause, and deceive or impose on the judge, or the parties.

* Some derive the word from *Ciccum*, the skin of a pomegranate; whence the Spaniards formed their *Chico*, little, slender, *Chicane* being conversant about trifles.

The French call solicitors, attorneys, &c. *Gens de Chicane*.

CHICANE is also applied in the schools, to vain sophisms, distinctions, and subtilties, which immortalize disputes, and obscure the truth; as the *Chicane* of courts does justice.

CHIEF *, a term denoting head, or a principal thing, or person.

* The word is formed of the French *Chief*, head; of the Greek *κεφαλη*, *caput*, head: though Menage derives it from the Italian *Capo*, formed of the Latin *Caput*.

We say, the *chief* of a party; the *chief* of a family, &c. Agamemnon was the *chief* of the Greeks who besieged Troy; the Romans sometimes refused triumphs to their victorious generals; by reason the conduct of the *chief* was not answerable to his success. The abbies that are *chiefs* of their order are all regular; and it is there the general chapters are held.

CHIEF-JUSTICE. See the article *JUSTICE*.

CHIEF LORD, denotes the feudal lord, or lord of an honour, on whom others depend. See *LORD*; see also *HONOUR*.

Holding in CHIEF. See *CAPITE*, and *TENURE*.

CHIEF, in heraldry, is the upper part of the escutcheon, reaching quite across, from side to side.

The arms of France are three golden flower de lys's, in a field azure; two in *chief*, and one in point.

CHIEF is more particularly used for one of the honourable ordinaries, placed athwart the top of the coat, and containing one third part of its height.

When the escutcheon is cut in stone, or in relief, the *Chief* stands out prominent beyond the rest; and is supposed to represent the diadem of the ancient kings and prelates; or the cask of the knights.

It is frequently without any ornament; sometimes it is charged with other bearings; sometimes it is of a colour or metal different from that of the coat.

The line that bounds it at the bottom is sometimes frait, sometimes indented, engrailed, embatteled, lozenged, &c. Thus, say they, The field is gules, a *chief* argent, &c. again, he bears gules, a *Chief* crenele, or embatteled argent.

Sometimes one *Chief* is born on another; expressed by a line drawn along the upper part of the *Chief*: when the line is along the under part, it is called a *Filler*. The first is an addition of honour, the second a diminution.

The *Chief* is said to be *abased*, when it is detached from the upper edge of the coat, by the colour of the field which is over it; and which retrenches from it one third of its height. We also say, a *Chief* is *chevroned*, *paled*, or *banded*, when it has a chevron, pale, or bend contiguous to it, and of the same colour with itself. A *Chief* is said to be *supported*, when the two thirds at top are of the colour of the field, and that at bottom of a different colour.

In CHIEF.—By this is understood any thing born in the *Chief* part, or top of the escutcheon.

CHIEF-PLEDGE, the same as headborough. See *HEADS*.

CHIEF-POINT. See the article *POINT*.

CHIEFTAIN, the *Chief*, leader, or general of an army, or the like.

CHILBLAIN *, *Pernio* †, (in medicine) a tumour arising on the feet and hands; accompany'd with an inflammation, pain, and sometimes an ulcer, or solution of continuity: in which case it takes the denomination of *chaps* ‡, on the hands; and *kibes* §, on the heels.

* *Chilblain* is compounded of *chill* and *blain*; *q. d.* a blain or sore contracted by cold.

† *Pernio* is the Latin name adopted by the physicians; and is derived by Vossius from *perna*, a gammon of bacon, on account of some resemblance.

‡ *Chop* alludes to gape, both in found and appearance.

§ *Kibes*, in Welsh *kibai*, may be derived from the German *kiben*, to cut; the skin, when broke, and appearing as if cut.

Chilblains are occasioned by excessive cold stopping the motion of the blood in the capillary arteries.

The tumour, from white, generally inclines to bluefness. For the cure of *Chilblains* it is usual to wash them with warm brine, urine, &c. but petroleum, or warm hungary water, with spirit of wine camphorated, used with a sponge, are much better.

—For chaps and kibes, nothing exceeds the unguentum delicatium rubrum, or diapompholyx mix'd with a little camphor; and used, for the dressings, with emplastrum æminio, or diachylon simplex, let-down with oil of roses.

CHILD, a term of relation to parent.

We say, natural *Child*, legitimate *Child*, putative *Child*, bastard *Child*, adoptive *Child*, posthumous *Child*, &c. See *NATURAL*, *PUTATIVE*, *BASTARD*, *ADOPTIVE*, *POSTHUMOUS*, &c.

M. Derham computes, that marriages, one with another, produce four *Children*; not only in England, but in other parts also.

In the genealogical history of Tuscany, wrote by Gamarini, mention is made of a nobleman of Sienna, named Pichi, who of three wives had a hundred and fifty *Children*; and that, being sent ambassador to the pope and the emperor, he had forty eight of his sons in his retinue.

In a monument in the church-yard of St. Innocent, at Paris, erected to a woman who died at eighty-eight years of age, it is recorded, that she might have seen 288 *Children* directly issued from her. This greatly exceeds what Hakewell relates of Mrs. Honeywood, a gentlewoman of Kent, born in the year 1527, and married at sixteen to her only husband R. Honeywood, of Charing, Esq; and who died in her ninety third year.

She had sixteen *Children* of her own body; of which three died young, and a fourth had no issue: yet her *Grandchildren* in the second generation, amounted to 114; in the third to 228; tho' in the fourth they fell to 9. The whole number she might have

seen in her life-time being $367. 16 + 114 + 228 + 9 = 367$. So that she could say the same as the distich does of one of the Dalburg's family at Basil.

Mater ait natæ dic natæ filia natam,
5
6

Ut moneat, natæ, plangere filiulam.

Dr. Harris has an express treatise of the *acute diseases of Children, de morbis acutis infantum*. He takes them all to arise from the humours in the primæ viæ growing fowre, and degenerating into acidities; which is confirmed from their fowre belches and dejections. Hence all that is required to cure them, is to combat this acidity; which is to be effected two ways; by dissipating it to be evacuated, and by actual evacuation by rhubarb, and other gentle purgatives.

To dispose the effluent acid for evacuation, no subductions or cordials are to be used, those remedies being two violent; but crabs eyes and claws, oyster-shells, cuttlefish-bones, egg-shells, chalk, coral, pearls, bezoar, burnt ivory, scrapings of the unicorn's horn, armenian bole, terra sigillata, and lapis hematites; the goa stone, and the confectio of hyacinth. But of all these, he prefers old shells that have lain long on the edge of the sea, exposed to the sun, which is better than any chymical furnace.

CHILD-BED

See the article DELIVERY.

CHILD-BIRTH
CHILD-WELFARE

CHILD-WIT, a power to take a fine of a bond-woman unlawfully gotten with *child*, that is, without content of her lord. Every reputed father of a bafe *Child*, got within the manor of Writtel in Essex, pays to the lord for a fine 3 s. 4 d. where, it seems, *Child-wit* extends to free, as well as bond-women.—*Quicumque fecerit Child-wit, Archiepiscopus aut totam, aut dimidiam emendationis partem habebit, quietum esse de Child-wit.* Du Cange.

Charity-CHILDREN. See CHARITY-School, and HOSPITAL.

CHILDERMASS-*Day*, called also *Innocents-Day*, an anniversary feast of the church, held on the 28th of December, in memory of the *Children* of Bethlehem, massacred by order of Herod.

CHILIAD*, an assemblage of several things ranged by thousands.

* The word is formed of the Greek *χίλιας*, *mille*, a thousand.

ILIARCHA *, or CHILIARCHUS, an officer in the armies of the antients, who had the command of a thousand men.

* The word comes from the Greek *χλίας*, *thousand*, and *αρχή*, *command*.

ILIASTS. See the article MILLENARY.

CHILMINAR, CHELMINAR, or *Tchelmanar*.

most beautiful piece of architecture remaining of all antiquity; being the ruins of the famous palace of Persepolis, to which Alexander the great, being drunk, set fire, at the persuasion of the courtesan Thais.

Authors and travellers are exceedingly minute in their descriptions of the *Chilmnar*; particularly Gracias de Silva Figueroa, Pietro de la Valle, Chardin, and Le Brun.

A general idea thereof, may be conceived as follows. There appear the remains of near fourscore columns; the fragments whereof are at least six foot high: but there are only nineteen that can be called entire; with a twentieth all alone, 150 paces from the rest.

A rock of black hard marble, serves for the foundation of the edifice. The first plan of the building is ascended to by four-score and fifteen steps cut in the rock. The gate of the palace is twenty foot wide; on one side is the figure of an elephant, and on the other of a rhinoceros, each thirty foot high, and of shining marble. Near these animals are two columns; and not far off the figure of a Pegasus.

After this gate is passed, there are found a great number of columns of white marble; the remains whereof shew the magnificence of the work; the smallest of these columns is fifteen cubits high, the largest eighteen; each has forty flutings, three large inches broad; whence the height of the whole may be guessed at, with the other proportions. Near the gate is an inscription on a square piece of marble, smooth as glass, containing about twelve lines: the characters are of a very extraordinary figure, resembling triangles and pyramids.

These noble ruins are now the shelter of beasts, and birds of prey. Besides the inscription abovementioned, there are others in Arabic, Persian, and Greek. Dr. Hyde observes, that the inscriptions are very rude and unartful; and that some, if not all of them, are in praise of Alexander the great, and therefore are later than that conqueror.

M. Le Brun tells us, that he took his voyage to the East-Indies merely for the sake of viewing the *Chilminar*.

CHIMÆRA, or **CHIMÆRA**, a fabulous monster, which the poets feign to have the head and breast of a lion, the belly of a goat, and the tail of a dragon; and to have been killed by Belerophon, mounted on the horse Pegasus.

The foundation of the fable is this; that antiently in Lycia there was a volcano, or burning mountain of this name, the top whereof, which was desert, only inhabited by lions; the middle, having good pastures, was frequented by goats; and the foot, being marshy, by serpents. Thus Ovid :

Pectus, & ora lææ, caudam serpentis habebit.
Bellerophon being the first who caused this mountain to be in-

habited, it was feigned he flew *Chimera*. Pliny says, the fire thereof would burn in water, and could be extinguished with nothing but earth or dung.

CHIMES *of a clock*, a kind of periodical musick, produced at certain seasons of the day, by a particular apparatus added to a *Clock*.

To calculate numbers for the *Chimes*, and to fit and divide the *Chime-barrel*, it must be observed, that the barrel must be as long in turning round, as you are in finging the tune it is to play. As for the *Chime-barrel*, it may be made up of certain bars which run athwart it, with a convenient number of holes punched in them, to put in the pins that are to draw each hammer: by this means the tune may be changed, without changing the barrel. In this case, the pins, or nuts, which draw the hammers, must hang down from the bar, some more, some less; and some must stand upright in the bar: the reason whereof is, to play the time of the tune rightly: for the distance of each of these bars may be a femibreve; but the usual way, is to have the pins which draw the hammers fixed on the barrel.

For the placing of these pins, you may proceed by the way of changes on bells, viz. 1, 2, 3, 4, &c. or rather, make use of the musical notes: where it must be observed, what is the compass of the tune, or how many notes, or bells, there are from the highest to the lowest; and accordingly, the barrel must be divided from end to end.

Thus, in the following example, each of the tunes are eight notes in compass; and accordingly, the barrel is divided into eight parts. These divisions are struck round the barrel; opposite to which are the hammer-tails.

We speak here as if there were only one hammer to each bell, that it may be more clearly apprehended; but when two notes of the same found come together in a tune, there must be two hammers to the bell to strike it: so that if in all the tunes you intend to *chime* of eight notes compass, there should happen to be such double notes on every bell; instead of eight, you must have sixteen hammers; and accordingly you must divide the barrel, and strike sixteen strokes round it, opposite to each hammer-tail: then you are to divide it round about, into as many divisions as there are musical bars, semibreves, minims, &c. in the tune.

Thus the hundredth palm-tune has twenty femibreves, and each division of it is a femibreve: the first note of it also is a femibreve; and therefore on the *Chime-barrel* there must be a whole division, from five to five; as you may understand plainly, if you conceive the surface of a *Chime-barrel* to be represented by the following tables; as if the cylindrical superficies of the barrel were stretched out at length, or extended on a plane: and then such a table, so divided, if it were to be wrapped round the barrel, would shew the places where all the pins are to stand in the barrel: for the dots running about the table, are the places of the pins that play the tune.

Indeed, if the *chimes* are to be complete, yet ought to have a set of bells to the gamut notes; so as that each bell having the true sound of *fa, la, mi, fa*, you may play any tune with its flats and sharps; nay, you may by this means play both thebafs and treble with one barrel: and by fetting the names of your bells at the head of any tune, that tune may easily be transferred to the *Chime-barrel*, without any skill in mufick: but it muft be obferved, that each line in the mufick is three notes diftant; that is, there is a note between each line, as well as upon it.

The notes of the hundredth psalm.

A table for dividing the Chime-barrel of the hundredth psalm.

CHIMIN, or CHEMIN, in law, a road or way. See ROAD. Hence, CHIMINAGE, a toll for wayfarage, or passage through a forest. The Feudists call it *pedagium*.

CHIMNEY *, in architecture, a part of a house, or lodging, wherein the fire is made.

* The word *Chimney* comes from the French *Cheminee*; and that from the Latin *Caminata*, a chamber wherein is a *Chimney*: *Caminata*, again, comes from *Caminus*, and that from the Greek, *καμινος*, a *Chimney*; of *καω*, *aro*, I burn.

The parts of a *Chimney* are the jambs, or sides; the back or hood; the mantle-tree, resting on the jambs: the tube, or funnel, which conveys away the smoke; the *Chimney-piece*, or moulding, on the fore-side of the jambs over the mantle-tree; and the hearth, or fire-place.

Palladio settles the proportions of a chamber-*Chimney* thus; breadth on the inside, $5\frac{1}{2}$, 6 or 7 foot; height to the mantle-tree, 4, or $4\frac{1}{2}$; depth, 2, or $2\frac{1}{2}$ foot.

According to Wolfius, the breadth of the aperture, at bottom to be to the height, as three to two, to the depth as four to two. In small apartments the breadth is three foot, in larger five; in bed-chambers four; in small banquetting-rooms $5\frac{1}{2}$, in large 6. But the height is never to exceed $2\frac{1}{2}$, lest there being too much room for the air and wind, the smoke be driven down into the room. Nor must the height be too little, lest the smoke miss its way, and be checked at first setting out. The same author advises to have an aperture, through which the external air may, on occasion, be let into the flame, to drive up the smoke; which the internal air would otherwise be unable to do.

The mouth of the tube, or that part joined to the *Chimney* back, Felibien orders to be a little narrower than the rest; that the smoke coming to be repelled downwards, meeting with this obstacle, may be prevented from getting into the room.

Some make the funnel twisted, to prevent the smoke's descending too easily: but the better expedient is to make the funnel narrower at bottom than at top; the fire impelling it upward more easily when contracted at bottom; and in mounting, it finds more space to disengage itself, and therefore has less occasion to return into the chamber.

To prevent smoking CHIMNEYS, M. Lucar advises two holes, or two pipes, one over the other, to be left in each side of the *Chimney*; one sloping upwards, the other downwards: through one of these, says he, the smoke will pass in any position.

De l'Orme orders a brass ball full of water, with one small aperture, to be hung up in the *Chimney*, at a height a little above the greatest flame: here, as the water grows hot, it will rarefy and drive through the aperture in a vapoury steam, which will drive up the smoke that would otherwise linger in the funnel.

Others place a kind of moveable vane, or weathercock a-top of the *Chimney*: so that what way soever the wind comes, the aperture of the *Chimney* will be screened, and the smoke have free egress: but in truth the best prevention of a smoking *Chimney*, seems to lie in the proper situation of the doors of the rooms, and the apt falling back of the back, and convenient gathering of the wings and breast of the *Chimney*.

It is a rule, in building, that no timber be laid within twelve inches of the fore-side of the *Chimney* jambs; that all joists on the back of the *Chimney* be laid with a trimmer, at six inches distance from the back; and that no timber be laid within the funnel.

Chimneys are usually supposed a modern invention; the ancients only making use of stoves: but Octavio Ferrari endeavours to prove *Chimneys* in use among the ancients. To this end he cites the authority of Virgil: *Ei jam summa precui villarum culmina fumant*. And that of Appian, who says, 'That of those persons profcribed by the Triumvirate, some hid themselves in wells, and cloaca, common-floues; some in the tops of houses, and *Chimneys*:' for so he understands $\kappa\alpha\tau\alpha\ \sigma\upsilon\mu\phi\alpha\sigma\iota\varsigma$, *summaria sub tecto posita*. Add, that Aristophanes, in one of his comedies, introduces his old man, Polypleon, shut up in a chamber, whence he endeavours to make his escape by the *Chimney*.

However, the few instances remaining among the ancients, together with the obscurity of the rules of Vitruvius on this head, make us rather conclude the use of stoves, whereof the ancients had entire apartments, made them neglect this point of building, which the coldness of our climates obliges us to have a principal regard to.

In the year 1713, there appeared a French book, entitled, *La Mécanique du Feu*, or the art of augmenting the effects, and diminishing the expense of fire, by M. Gauger; since published in English, by Dr. Delisle; wherein the author examines what disposition of *Chimneys* is most proper to augment the heat; and proves geometrically, that the disposition of parallel jambs, with the back inclined as in the common *Chimneys*, is less fitted for reflecting heat into the room, than parabolical jambs, with the bottom of the tablette horizontal.

He gives seven several constructions of his new *Chimneys*, and the manner of executing them.

M. Gauger, however, does not appear to be the first inventor of the *Chimney* he describes; the description of a like *Chimney* being found in a German book, printed at Leipzig, in 1699.

CHIMNEY-JAMBS, are the sides of a *Chimney*, usually standing out perpendicularly, sometimes circularly, from the back; on the extremities whereof the mantle-tree rests.

CHIMNEY-MONEY, or hearth-money, a tax imposed by statute 24 Car. II. expressing, that every fire-hearth and stove of every dwelling, or other house within England and Wales, except such as pay not to church and poor, shall be chargeable with two shillings *per ann.* payable at Michaelmas and Lady-day, to the king and his heirs.

CHIMNEY-PIECE, in building, a composition of certain mouldings, of wood or stone, standing on the fore-side of the jamb, and coming over the mantle-tree.

CHINA, or CHINA-Ware, a fine sort of earthen ware, properly called *porcelain*. See PORCELAIN.

CHINA-CHINA, a name sometimes given to the Quinquina, or Peruvian Bark. See QUINQUINA.

CHINA-ROOT, a medicinal root, brought from the East-Indies; and lately also from Peru, and New Spain.

It is of a ruddy brown colour, bordering on black, without-side; and white, or reddish, within. It grows chiefly in fenny places, usually covered with the sea; which, upon its withdrawing, leaves great quantities thereof on the shore: the best is that which is firm, ruddy, and fresh.

It is esteemed a sweetener of the blood; and used as such in decoction, in venereal and scorbutic cafes.

CHINESE, or *Chinefs Tongue*, the language of the people of China.

F. le Comte observes, that the *Chinefs* has no analogy to any other language in the world: it only consists of three hundred and thirty words, which are all monosyllables; at least, they are pronounced so short, that there is no distinguishing above one syllable, or sound, in them. But the same word, as pronounced with a stronger or weaker tone, has different significations: accordingly, when the language is accurately spoke, it makes a sort of music, which has a real melody, that constitutes the essence and distinguishing character of the *Chinefs* tongue.

As to *Chinefs Characters*, they are as singular as the language: the *Chinefs* have not, like us, any alphabet, containing the elements, or as it were the principles of their words: in lieu of an alphabet, they use a kind of hieroglyphicks; whereof they have above eighty thousand.

CHIN-COUGH, a disease which children are chiefly subject to. It consists in a violent and immoderate coughing, to a danger of suffocation. Letting of blood, and balsamicks, are the usual cure.

CHIRAGRA*, in medicine, the gout in the hands.

* The word comes from the Greek $\chi\epsilon\iota\rho$, *manus*, hand; and $\alpha\gamma\epsilon\iota\varsigma$, *captura*, seizing.

The *Chiragra*, has its seat in the carpus, or extreme part of the hand, or the ligaments and junctures of the fingers.

CHIROGRAPH*, CHIROGRAPHUM, was antiently a deed which requiring a counterpart, was engrossed twice on the same piece of parchment, counterwise; leaving a space between, wherein was wrote *CHIROGRAPH*; through the middle whereof the parchment was cut, sometimes straight, sometimes indentedly; and a moiety given to each of the parties.

* The word is compounded of the Greek $\chi\epsilon\iota\rho$, *hand*; and $\gamma\rho\alpha\phi\eta$, *scribo*, I write: *g. d. hand-writing*.

This was afterwards called *videnda*, and *charta divisæ*; and was the same with what we now call *charter-party*. See CHARTER-PARTY.

The first use of these *Chirographs* with us, was in the time of king Henry III.

According to some, a deed was properly a *Chirograph*, when it was subscribed by the hand-writing of the vendor, or creditor, and delivered to the buyer, or debtor. These authors make the *Chirograph* differ from a *Syngraph*, in this; that in the latter, the word *Syngraph* was wrote in the middle, and cut through, in the manner just observed of *Chirograph*. Those authors, therefore, make the *Syngraph* and the *Chirograph* a different thing.

CHIROGRAPH was also antiently used for a fine: the manner of engrossing the fines, and cutting the parchment in two pieces, is still retained in the office, called the *Chirographer's Office*.

CHIROGRAPHER of Fines, an officer in the common pleas, who engrosses fines acknowledged in that court, into a perpetual record, (after they have been examined, and passed by other officers;) and writes and delivers the indentures thereof to the party.

He makes two indentures, one for the buyer, the other for the seller; and a third indented piece, containing the effect of the fine, and called *the foot of the fine*; and delivers it to the *custos brevium*.

The same officer also, or his deputy, proclaims all fines in court every term, and endorses the proclamations on the backside of the foot; keeping, withal, the writ of covenant, and the note of the fine.

CHIROMANCY*, the art of divining the fate, temperament, and disposition of a person, by the lines, and lineaments of the hand; this is otherwise called *palmistry*.

* The word comes from the Greek $\chi\epsilon\iota\rho$, *hand*; and $\alpha\pi\alpha\epsilon\iota\varsigma$, *divination*.

We have a great number of authors on this vain and trifling art; as Artemidorus, Fludd, and Johannes de Indagine: Tautnerus, and M. de le Chambre have done the best.

This last insists on it, that the inclinations may be known from inspecting the hand; there being a very near correspondence between the parts of the hand, and the internal parts of the body, the heart, liver, &c. whereon the passions and inclinations much depend. He adds, however, that the rules and precepts of *Chiromancy* are not sufficiently warranted, the experiments whereon they stand, not being well verified. He concludes, that there must be a new set of observations, made with justice and exactness; in order to give *Chiromancy* the form and solidity which an art or science demands.

CHIROTANIA*, the imposition of hands, in conferring any priestly orders. See **IMPOSITION**.

* The word comes from the Greek *χρῶσις*, the action of stretching out the hands: and because the antients gave their suffrages by stretching out the hands, they gave the name *Chirotania* to the election of magistrates.

This custom was first established in Greece; as appears from an oration of Demosthenes against Neera, and that of Æschines against Ctesiphon: thence it passed to the Romans. From prophane authors it passed to ecclesiastical ones; and was used by them, not only in speaking of elections, but also of ordinations.

CHIRURGERY*, popularly called *Surgery*, the third branch of medicine; consisting in operations performed by the hand, for the cure of wounds, and other disorders.

* The word *Chirurgery* is formed from the Greek *χειρ*, manus, hand; and *εργον*, *εργα*, operation.

Chirurgery may be defined the art of curing wounds, and various diseases, by the opening of veins, application of topics, and by incisions, and amputations of several parts of the body.

Chirurgery is divided into speculative, and practical; one whereof does that in effect, which the other teaches to do.

All the operations of *Chirurgery* are reduced under four kinds: the first whereof rejoins what has been separated; and is called *synthesis*.

The second divides, with discernment, those parts whose union is prejudicial to health; and is called *diæresis*.

The third extracts with art, foreign bodies; called *exarexis*.

And the fourth, called *præthesis*, adds and applies what is wanting.

The principal things that come under the consideration of *Chirurgery*, are tumors, ulcers, wounds, dislocations, and fractures. *Chirurgery* has the advantage of medicine in the solidity of its foundation, the certainty of its operations, and the sensibility of its effects; inasmuch, that those who deny medicine to be of any significance, yet allow the usefulness of *Chirurgery*.

Chirurgery is very antient; and even much more so than medicine, whereof it now makes a branch. It was, in effect, the sole medicine of the first ages: they beating themselves to the cure of external disorders, before they came to examine or discover what related to the cure of internal ones.

Apis, king of Egypt, is said to be the first inventor of *Chirurgery*; after him, Æsculapius composed a treatise of wounds and ulcers. He was succeeded by the philosophers of the following ages, in whose hands *Chirurgery* wholly lay; such were Pythagoras, Empedocles, Parmenides, Democritus, Chiron, Pæon, Cleombrotus, who cured king Antiochus, &c. Pliny tells us, upon the authority of Cassius Hemina, that Arca-gathus was the first of the profession that settled at Rome: that the Romans were wonderfully pleased with this *Vulnerarius*, as they called him, at his first coming, and shewed him some extraordinary marks of their esteem; but that they were disgusted at him afterwards, and nick-named him *Carnifex*, for his cruelty in cutting off limbs. Some pretend, that he was even stoned by them to death in the Campus Martius. But if he really came to such an unlucky end, it is strange Pliny should take no notice of it. Vid. Pliny, Hist. Nat. l. 29. c. 1.

Chirurgery was cultivated with much more earnestness by Hippocrates, than by any of the preceding physicians: It is said to have been perfected in Egypt by Philoxenus, who wrote several volumes on that subject. Among the Greeks, Gorgias, Sofrates, Heron, the two Apollonius's, Ammonius of Alexandria; and at Rome, Trypho the father, Evelpistus, and Mege, made it flourish, each in their time.

The more modern authors, who have contributed most to the perfection of *Chirurgery*, are Paræus, Fab. ab Aquapendente, Harvey, Wharton, Glisson, Du Laurence, Diemerbroeck, Vieussens, Barbet, Dionis, Charrière, Heister, &c. Scultetus has published a description of all the instruments used in *Chirurgery*, under the title of *amentarium chirurgicum*; and our countryman, Mr. Wiseman, Serjeant-Chirurgion to king Charles II. a folio volume of *Chirurgical treatises*, containing practical observations, both in respect to the internals and externals, of a number of cases in each branch of the art, from his own experience; under the title of *several chirurgial treatises*. This work has been made use of ever since, by the most knowing of our English *Chirurgians*; and has been the foundation of most *chirurgical treatises* since its publication, Anno 1676. In England there are two distinct companies now occupying the science or faculty of Surgery; the one company called *Barbers*, the other *Surgeons*, which latter were not till very lately incorporated.—The two were united to sue, and be sued, by the name of masters or governors and commonalty of the mystery of Barbers and Surgeons of London. 32 H. 8. c. 42. No person using any Barbary, or shaving, in London, was to occupy any Surgery, letting of blood, or other matter; drawing of teeth only excepted.—And no person using the mystery or craft of Surgery was to occupy or exercise the feat or craft of Barbary, or shaving; neither by himself, nor any other for his use. 32 H. 8. c. 42.

By the same statute, Surgeons were obliged to have signs at their doors.

The French *Chirurgians* being refused to be admitted into the

universities, notwithstanding that their art makes a branch of medicine, one of the four faculties; on pretence of its bordering a little on butchery, or cruelty; associated themselves into a brotherhood, under the protection of S. Cosmas, and S. Damian: on which account, according to the laws of their institution, they are obliged to dress and look to wounds gratis, the first Monday of each month.

They distinguish between a *Chirurgion of the long robe*, and a *Barber Chirurgion*: the first has studied physick, and is allowed to wear a gown.

The skill of the other, beside what relates to the management of the beard, is supposed to be confined to the more simple and easy operations in *Chirurgery*; as bleeding, tooth-drawing, &c. They were formerly distinguished by badges; those of the long gown bore a case of instruments; and the barber a basin.

CHISEL, an instrument much used in sculpture, masonry, joinery, carpentry, &c.

There are *Chissels* of different kinds; though their chief difference lies in their different size and strength, as being all made of steel well sharpened and tempered: but they have different means, according to the different uses to which they are applied.—The *Chissels* used in carpentry and joinery, are, 1. The *Former*, which is used first of all before the paring-*Chissel*, and just after the work is finished. 2. The *Paring-Chissel*, which has a fine smooth edge, and is used to pare off, or smooth the irregularities which the former makes. This is not struck with a mallet, as the former is, but is pressed with the shoulder of the workman. 3. *Skew-former*, this is used for cleaning acute angles with the point, or corner of its narrow edge. 4. The *Mortice-Chissel*, which is narrow, but very thick and strong, to endure hard blows; and it is cut to a very broad half: its use is to cut deep square holes in the wood, for mortices. 5. The *Gauge*, which is a *Chissel* with a round edge; one side whereof serves to prepare the way for an auger, and the other to cut such wood as is to be rounded, hollowed, &c. 6. *Socket-Chissels*, which are chiefly used by carpenters, &c. have their shank made with a hollow socket at top, to receive a strong wooden sprig, fitted into it with a shoulder. These *Chissels* are distinguished, according to the breadth of the blade, into half inch *Chissels*, three quarters of an inch *Chissels*, &c. 7. *Ripping-Chissels*, which is a socket-*Chissel* an inch broad; having a blunt edge, with no bevel to it: its use is to rip, or tear two pieces of wood asunder, by forcing in the blunt edge between them.

CHITTING, in gardening.—A feed is said to *chit*, when it first shoots its small roots into the earth.

CHIVALRY, or **CHEVALRY**, in law, a tenure of land by knight-service; whereby the tenant was antiently bound to perform service in war, to the king, or the mesne lord of whom he held by that tenure.

By a statute of 12 Car. II. all tenures by *chivalry*, in capite, &c. are abolished.

CHIVES, or **CHIEVES**, in botany, the small knobs growing on the ends of the fine threads, or stamina of flowers: by Ray and others called also *apices*.

Dr. Grew calls the stamina, or threads themselves, on which the apices are fixed, the *Chives*.

CHLAMYS, in antiquity, a military habit, worn by the antients over the tunica.

Chlamys was the fame, in time of war, that the *taga* was in time of peace; each belonged to the Patricians. It did not cover the whole body, but chiefly the hind-part; though it also came over the shoulders, and was fastened with a buckle on the breast. There were four or five kinds of *Chlamys*; that of children, that of women, and that of men; which last was divided into that of the people, and that of the emperor.

CHLOROSIS*, in medicine, a feminine disease, vulgarly called the *green-sickness*, *white-jauundice*, &c.

* The word *Chlorosis* signifies *greenness*, *verdure*; formed from *χλωρ*, *erast*.

Its usual subjects are girls, maids, and widows; or even wives, whose husbands are deficient, &c. It gives a pale, yellow, or greenish tincture to the complexion, with a circle of violet under the eyes. The patient is melancholy and uneasy; has frequently a low wandering fever, with an unequal pulse, vomiting, heaviness, listlessness, drowsiness, difficulty of breathing, longing for absurd foods, &c.

It comes on, commonly, antecedent to, or about the time of the eruption of the menses.—Though the stoppage of the menses is not always the cause of this distemper; for they sometimes, though but seldom, flow regularly, in the progress thereof. According to Etimuller, the suppression of the menses is rather the effect than the cause of this disease.

The cure is chiefly to be attempted by chalybeats and bitters. In the colder constitutions, decoctions of gualiacum are found of use. See *Supplement*, article **CHLOROSIS**.

CHOCOLATE, a kind of cake, or confection prepared of certain drugs; the basis, or principal whereof, is the *cacao nut*.

The name *Chocolate* is also given to a drink, prepared from this cake, of a dusky colour, soft, and oily; usually drank hot: and esteemed not only an excellent food, as being very nourishing, but also a good medicine; at least a diet, for keeping up the warmth of the stomach, and assisting digestion.

The

The Spaniards were the first who brought *Chocolate* into use in Europe; and that, perhaps, as much out of interest, to have the better market for their cacao nuts, vanilla, and other drugs which their West-Indies furnish, and which enter the composition of *Chocolate*; as out of regard to those extraordinary virtues, which their authors so amply enumerate in it. The qualities abovementioned, are all that the generality of physicians, and others, allow it.

Original manner of making CHOCOLATE.—The method first used by the Spaniards, was very simple, and the same with that in use among the Indians; they only used cacao nut, maize, and raw sugar, as expressed from the canes, with a little achiote, or rocou, to give it a colour. Of these four drugs, ground between two stones, and mixed together in a certain proportion, those barbarians made a kind of bread, which served them equally for solid food, and for drink; eating it dry when hungry, and steeping it in hot water when thirsty.

This drink the Mexicans called *Chocolate*, from *cacao*, sound, and *alte*, or *atte*, water; *q. d.* water that makes a noise: from the noise which the instrument used to mill and prepare the liquor, made in the water.

But the Spaniards, and other nations, afterwards added a great number of other ingredients to the composition of *Chocolate*; all of which, however, vanilla alone excepted, spoil rather than mend it.

Method of making CHOCOLATE, now in use among the Spaniards of Mexico.—The fruit being gathered from the cacao tree, is dried in the sun, and the kernel taken out, and roasted at the fire, in an iron pan pierced full of holes; then pounded in a mortar; then ground on a marble stone, with a grinder of the same matter, till it be brought into the consistence of a paste; mixing with it more or less sugar, as it is to be more or less sweet. In proportion as the paste advances, they add some long pepper, a little achiote, and lastly, vanilla: some add cinnamon, cloves, and anise; and those who love perfumes, musk and ambergris.

There is also a kind of Mexican *Chocolate*, in the composition whereof there enter almonds and filberts; but 'tis rather to spare the cacao, than to render the *Chocolate* better: and accordingly, this is looked on as sophisticated *Chocolate*.

The *CHOCOLATE* made in Spain, differs somewhat from that made in Mexico: for besides the drugs used in this last, they had two or three kinds of flowers, pods of campeche, and generally almonds and hazel nuts. The usual proportion, at Madrid, is to a hundred kernels of cacao, to add two grains of Chilé, or Mexican pepper, or in lieu thereof, Indian pepper; a handful of anise; as many flowers, called by the natives *vinacaxtilides*, or little ears; six white roses in powder; a little machuia; a pod of campeche; two drachms of cinnamon; a dozen almonds, and as many hazel nuts; with achiote enough to give it a reddish tincture. The sugar and vanilla are mixed at discretion; as also the musk and ambergris. They frequently work their paste with orange-water, which they think gives it a greater consistence and firmness.

The paste is usually made up into cakes, sometimes into large rolls. And sometimes the cakes are made up of pure *Chocolate*, without any admixture; those who use it being to add what quantity they please of sugar, cinnamon, and vanilla, when in the water.

Among us, in England, the *Chocolate* is chiefly made thus simple and unmixed, though (perhaps not unadulterated) of the kernel of the cacao; excepting that sometimes sugar, and sometimes vanilla is added: any other ingredients being scarce known among us.

The newest *Chocolate* is esteemed the best; the drug never keeping well above two years; but usually degenerating much before that time.

It is to be kept in brown paper, put up in a box; and that in another in a dry place.

The manner of preparing the *malt* into a liquor, with the proportions, are various: ordinarily, the *Chocolate* is boiled in water, sometimes in milk; and sometimes, by good economists, in water-gruel: when boiled, it is milled, or agitated with a wooden machine for the purpose, and boiled again, till it be of the proper consistence for drinking; then sugared, if the *malt* were pure; then milled afresh, and poured off.

Note, the best *Chocolate* is that which dissolves entirely in the water, leaving no grounds, or sediment at the bottom of the pot.

There is a dispute among the casuists, whether or no *Chocolate* break the fast? the negative is very stiffly asserted by cardinal Brancaccio, who has wrote expressly on the subject: though some have endeavoured to shew, that there is more nutritious juice in an ounce of cacao, than in a pound of beef or mutton.

The quantity of *Chocolate* made in New Spain is such, that there are annually used twelve millions of pounds of sugar in the preparation thereof. The Spaniards esteem it the last misfortune that can befall a man, to be reduced to want *Chocolate*: they are never known to leave it, excepting for some other liquor that will fuddle.

CHOIR *, that part of a church, cathedral, &c. where the clergy and choristers, or singers are placed.

* The word, according to *Lidore*, is derived à *coronis circumstantibus*.

tium; because, antiently, the choristers were disposed round the altar to sing: which is still the manner of building altars among the Greeks.

The *Choir* with us is distinguished from the chancel, or sanctuary, where the communion is celebrated: as also from the nave, or body of the church, where the people are placed.

The patron is said to be obliged to repair the *Choir* of a church; and the parishioners the nave.

The *Choir* was not separated from the nave, till the time of Constantine: from that time the *Choir* was raised in with a ballustrade, with curtains drawn over: not to be opened till after the consecration.

In the twelfth century they began to enclose the *Choir* with walls: but the antient ballustrades have been since reformed; out of a view to the beauty of the architecture.—The chantor is master of the *Choir*.

In nunneries, the *Choir* is a large hall, adjoining to the body of the church; separated by a grate, where the religious sing the office.

CHOLAGOGUE *, *Χολαγογ* *, a medicine which purges the bile downward.

* The word comes from *χολη*, *bile*, and *αγω*, to lead, draw.

Of these some are simple, others compound; and both the one and the other are distinguished into three kinds, with regard to their activity; the *benign*, the *moderate*, and the *violent*.

Of the first kind are manna, cassia, roses, tamarinds, &c.

Of the second, are sena, rhubarb, aloes, &c.

Of the third, jalop, scammony, &c. See each under its article, MANNA, CASSIA, SENA, &c.

CHOLEDOCHUS *, in anatomy, a term applied to a canal, or duct, called also *ductus communis*; formed of the union of the porus biliaris, and ductus cysticus.

* The word comes from the Greek *χολη*, *chole*, and *δωκευα*, I receive or contain.

The *Choledochus Ductus*, passing obliquely to the lower end of the duodenum, serves to convey the bile from the liver to the intestines. Some have imagined, that it conveyed the bile from the liver to the gall-bladder: but it being observed, that it is the duodenum, not the gall-bladder, that swells upon blowing through this duct; it is evident the bile contained therein, is conveyed no where else but to the duodenum. See BILE, LIVER, GALL-BLADDER, &c.

CHOLER. See the article BILE.

CHOLERA-MORBUS, a sudden overflowing, or eruption, of the bile, or bilious matters, both upwards, and downwards. See BILE.

It is supposed to have its rise from the great abundance of bilious humours, which being very acrimonious, vellicate the membranes of the stomach and intestines; and by that means occasion unusual and violent contractions.

It is very dangerous: whence the French antiently called it *Trouffe-Galand*.

It has its name, either from the great quantity of *Choler* it evacuates; or because the matter is incessantly expelled at the intestines, which they antiently called *Cholades*.

Dr. Sydenham observes, it generally attacks people about the latter end of summer; and proceeds, not unfrequently, from surfeits: that the cure depends upon large quantities of chicken-broth, drank so as to excite vomiting plentifully; and that the broth is also to be injected clysterwise: after which, he says, the cure is to be completed by laudanum, given at proper intervals, and in proper doses.

The remedy in the Indies for the *Cholera-morbus*, or *Mandechin*, is to keep the patient from drinking; and to burn the soles of his feet. See Supplement, article CHOLERA MORBUS.

CHONDROGLOSSUM, in anatomy, a very small muscle of the tongue, mentioned by Verheyen, and several other authors, exceedingly short and narrow; arising from the cartilaginous processes of the os hyoides, and meeting in the middle of the basis of the tongue, where 'tis inserted, forming an arch under it. This pair of muscles is not found in all subjects; whence some have questioned its existence: but nature takes so many liberties, in matters even of greater moment than a pair of muscles; that we need not on that score dispute the veracity of so many authors as profess to have seen it.

CHOP-CHURCH, or CHURCH-CHOPPER, a name, or rather nick-name, given to parsons, who make a practice of exchanging benefices.

Chop-church, occurs in an antient statute as a lawful trade, or occupation; and some of the judges say it was a good addition. Brook holds, that it was no occupation, but only a thing permissible by law.

CHOPIN, or CHOPINE, a French liquid measure; containing half their pint.

The Paris *Chopin* is nearly equal to the English pint. A *Chopin* of common water weighs a Paris pound. See PINT.

CHORD *, or **CORD**, primarily denotes a slender rope, or cordage.

* The word is formed of the Latin *Chorda*, and that from the Greek *χορδη*, a gut, whereof strings may be made.

CHORDS, or CORDS, in musick, denote the strings, or lines, by whose vibrations the sensation of sound is excited; and by whose divisions the several degrees of tune are determined.

They are called *Chords*, or *Chords* from the Greek $\chi\omicron\rho\delta\alpha$, a name which the physicians give to the intestines; in regard, the strings of musical instruments are ordinarily made of guts: though others are made of brass or iron wire; as those of spinets, harpicoords, &c.

Chords of gold wire, in harpicoords, yield a sound almost twice as strong as those of brass: *Chords*, or strings of steel, yield a feeble sound than those of brass; as being both less heavy, and less ductile.

Mr. Perrault observes, that of late they have invented a way of changing the *Chords*, to render the sound stronger, without altering the tone.

The sixth *Chord* of bass-viol, and the tenth of large theorbos, consist of fifty threads, or guts: there are some of them 100 foot long, twisted and polished with equisetum, or horse-tail.

For the division of *CHORDS*, so as to constitute any given interval, the rules are as follow: 1. To assign such a part of a *Chord* A B, as shall constitute any concord, v. g. a fifth, or any other interval, with the whole.

Divide A B into as many parts, as the greatest number of the interval has units;

v. g. the fifth being

2:3, the line is divided into 3. Of

these take as many

as the lesser number v. g. $2 = AC$. Then is A C the part sought: that is, two lines, whose lengths are to each other as A B to A C, make a fifth.

Hence, if it be required to find several different sections of the line A B, ϕ . g. such as shall be 8^{ve} 5th and 3d^g. Reduce the given ratios 1:2, 2:3, and 4:5, to one fundamental; the series becomes 30:24, 20:15. The fundamental is 30; and the sections sought are 24, the third g; 20, the fifth; and 15, the octave.

2. To find several sections of a line A B, that from the least, gradually to the whole, shall contain a given series of intervals in any given order; viz. to as the least to the next greater contain a third g; that to the next greater, a fifth; and that to the whole an octave.

Reduce the three ratios 4:5, 2:3, 1:2, to one series; hence we have 8:10:15:

30. Divide the line A B into the number of

parts of the greatest extreme of the series, viz. 30; we have the sections sought at the points of division answering the several numbers of the series, viz. at the points C, D, and E; so as A C to A D is a third, A D to A E a fifth, and A E to A B octave.

3. To divide a line A B into two parts, to contain betwixt them any interval, v. g. a fourth.

Add together the numbers containing the ratio of the interval, v. g. 3:4; and the line into as many parts as the sum, v. g. 7; the point of division answering to any of the given numbers, v. g. 4 or C, gives the thing sought.

4. For the harmonical division of *CHORDS*. To find two sections of a line, which with the whole shall be in harmonical proportion, with regard to their quantity.

Take any three numbers in harmonical proportion, as 3, 4, 6; and divide the whole line into as many parts as the greatest of these three numbers, v. g. 6; and at the points of division answering the other two numbers, v. g. 3 and 4, you have the sections sought.

5. To find two sections of a line, which together with the whole shall be harmonical, with respect to quality or tune.

Take any three numbers concords with each other, v. g. 2, 3 and 8, and divide the line by the greatest; the points of division answering the other two, give the sections sought.

6. To divide a *CHORD* A B, in the most simple manner, so as to exhibit all the original concords.

Divide the line into two equal parts at C, and subdivide the part C B into equal parts at D; and

again, the part C D into two equal parts at E. Here A C to

A B is an octave; A C to A D a fifth; A D to A B a fourth; A C to A E a third g; A E to A D a third l; A E to E B a sixth g and A E to A B a sixth l.

CHORD is also used in music, for the note or string to be touched, or sounded; in which sense, it is applicable to all the intervals of music.

CHORD, CHORDA, in geometry, a right line connecting the two extremes of an arch.

Or, it is a right line, terminated at each extreme in the circumference of a circle, without passing through the center; and dividing the circle into two unequal parts, called *Segments*.—Such is the line A B, Tab. Geometry, fig. 6.

CHORD of the complement of an arch, is the *Chord* that subtends the rest of the arch; or so much as makes up the arch a semicircle.

The *Chord* is perpendicular to a line drawn from the center of the circle to the middle of the arch, as C E; and has the same

disposition thereto, as the *Chord*, or string of a bow, has to the arrow: which occasioned the ancient geometricians to call this line the *Chord* of the arch, and the other the *sagitta*, or arrow; the former of which names is still continued, though the latter is disused. What the antients called *sagitta*, is now termed the *versed Sine*.

Half the *Chord* of the double arch, B a, is what we now call the *right sine*; and the excess of the radii beyond the *Chord*, e E, the *versed sine*.

The *Chord* of an angle, and the *Chord* of its complement to a semicircle, are the same thing. The *Chord* of fifty degrees is also the *Chord* of 130.

It is demonstrated, in geometry, that the radius C E, bisecting the *Chord* B A in D, does also bisect the arch in E, and is perpendicular to the *Chord* A B; and *vice versa*. And again, if the right line N E bisect the *Chord* A B, and be perpendicular thereto; that it passes through the center, and does bisect both the arch A E B, and the circle A N B.

Hence we derive several useful corollaries: as, 1. To divide a given arch A B into two equal parts. Draw a perpendicular to the middle point D of the *Chord* A B; this bisects the given arch A B.

2. To describe a circle, that shall pass through any three points A, B, C, fig. 7. From A and C describe arches intersecting in D and E; and also others, G and H, from C and B; draw the right lines D E and G H. The point of intersection I, is the center of the circle to be described through A, B, and C.

Demonstration. For the points A, B, and C, are in the periphery of some circle; and therefore, the lines A C and C B are *Chords*. But E D is perpendicular to A C, and G H to B C; E D bisects A C, and G H bisects B C; wherefore each passes through the center. Now as D E and G H only intersect in I, I will be the center of a circle, passing through the given points A, C, and B.

Hence, assuming three points in the periphery, or arch of any circle, the center may be found, and the given arch completed. Hence also, if three points of one periphery do agree or coincide with three points of another; the whole peripheries agree, and therefore the circles are equal.

And hence, lastly, every triangle may be inscribed in a circle. The *Chord* of an arch A B, (fig. 6.) and the radius C E being given; to find the *Chord* of the half arch A E. From the square of the Radius C E, subtract the square of half the given *Chord* A D, the remainder is the square of e C; from which, extract the square root = D C: this subtracted from the radius E C, leaves e E. Add the squares of A E and E a; the sum is the square of A E: whence, the root being extracted, we have the *Chord* of the half arch A E.

Line of *CHORDS*, is one of the *Lines* of the sector and plain scale. See its description and use under the words *SECTOR* and *PLAIN SCALE*.

CHORD, CHORDA, in anatomy, a little nerve extended over the membrana tympani, or drum of the ear. See *TYMPANUM*.

Anatomists are not agreed about the use of the *Chorda Tympani*: some say, it serves to vary and modify the sound of the tympanum, in the same manner as the strings, or braces, stretched over the war-drum. Others will have it to be no more than a branch of the fifth pair.

*CHORDAPUSUS**, in medicine, a disease of the intestines, otherwise called *volvulus*, the *slow passion*, and *miserere mei*: though others make it a distinct species of the *miserere*.

* The word comes from the Greek $\chi\omicron\rho\delta\alpha$, gut, and $\alpha\upsilon\tau\omicron\upsilon$, nels, I knot or tie.

Galen defines it, a tumidity, or inflation of the small intestines, which makes them appear filled, and stretched like a *Chord*. Archigenes makes it a kind of *miserere*; consisting in a tumor in a certain place of the small intestines; which links in, and gives way to the hand when pressed: he adds, that 'tis exceedingly dangerous, and ordinarily kills in three or four hours, unless it comes to supuration; which, however does not take away all the danger.

It is probable, however, that the *Chordapusus* is in reality nothing else but the *miserere* not well understood. Celsus informs us, that in his time they were esteemed the same thing.

CHORDEE, in medicine, an inflammation and contraction of the frenum, and under part of the penis; so as to render erection painful.

It happens in gonorrhoea, and is generally proportional to the degree of the virus received; so that in virulent gonorrhoea, it is usually a very troublesome symptom.

It proceeds from the acrimony of the matter which runs from the urethra, irritating the under part of the penis; by which it is, as it were, tied or held forcibly downwards in erection, especially its *frenum*. When the acrimony is considerable, it it sometimes gives rise to unnatural erections, or the symptom called a *priapism*.

If the *Chordee* be violent, or does not decrease proportionally to the other symptoms in gonorrhoea, an emetic of turbith mineral is usually given with success; it causing a revulsion from the part.

CHOREA sancti viti, in medicine, a distemper which some authors reckon as an hysterical case; or a species of furor uterinus.

It is supposed to proceed from a turgency and repletion of hot juices, especially in the uterine vessels, which raises violent motions; and that only females are affected by it: but Dr. Sydenham more properly observes it to be an universal Convulsion, which sometimes continues several weeks, nay months, without intermission.

Those affected with this disease, are continually in strange motions with their head, legs, and arms; so that they are unfit to feed themselves.—It differs from other convulsions, in that the motions are not painful, nor are any of the extremities or parts forcibly contracted, or extended for any time. Boys and girls are most subject to this disease, and that from ten years of age to puberty: though the latter oftner than the former.

It sometimes precedes the first eruption of the menfes; in which case, proper cathartics, with calomel and deobstruents, are generally used; otherwise evacuations and antiepileptics, as in other nervous distempers.

It takes the name *Chorea sancti viti*, or St. Vitus's dance, from the chapel of S. Vitus; because it was supposed to seize persons about May, which was the time of the year they visited that chapel, and to make them leap and dance about in a strange manner. See Supplement, article VITI CHOREA.

CHOREPISCOPUS*, an episcopal officer in the ancient church, about whose function the learned are extremely divided.

* The word comes from the Greek *χορηγος*, a region, or little country, and *ἐπίσκοπος*, a bishop, or overseer.

M. de la Roque thinks, that the *Chorepiscopi* were the country bishops, and had the same authority in villages, that the bishops had in cities; but that, by degrees, as the church flourished, the country bishops grew too proud for the country life; and imagined the episcopal honour debased, and rendered contemptible in a rural retreat. Accordingly, the Sardic council prohibited the consecration of bishops in the country, or in little towns; that the episcopal character might always be sustained by the splendor of great cities.

M. du Bois adds, that though the *Chorepiscopi* exercised most of the episcopal functions in country towns, &c. yet they were not ordained like bishops, nor vested with the whole authority of that order, but were only a step above mere priests.

M. le Maitre is of opinion, that the office of a *Chorepiscopus*, which is that now discharged by the rural deans, was to overlook, under the bishops, those parishes that were at a distance from the see in the country. He adds, that they were abolished, by reason they usurped the authority of the bishops.

Others, again, say, the *Chorepiscopi* were properly what we now call *bishops in partibus*; to whom, in quality of suffragans, were committed the administration of dioceses, during the bishop's absence.

Others rather think, the institution of *Chorepiscopi* gave occasion to that of the *episcopi in partibus*; which last, however, have privileges that the others had not.

Lastly, others take the *Chorepiscopi* to be no more than priests, vested by the bishops with most of their authority, in country places.

The council of Antioch, held in 342, appoints, "That those who in burghs and villages, called *Chorepiscopi*, know the bounds prescribed them; they may ordain readers, subdeacons, and exorcists, but not priests or deacons, without the bishop whereon they depend; and the *Chorepiscopus* shall be ordained by the bishop of the city."

Pope Leo, in 936, says, the *Chorepiscopi* may not ordain priests, or consecrate churches: yet pope Nicholas, in a letter to Raoul, in the ninth century, declares that the *Chorepiscopi* shall have the episcopal functions; and that the ordinations of priests and deacons performed by them are valid.

The first time we read of *Chorepiscopi* in the east, is in the beginning of the fourth century; and in the west, about the year 439. They ceased, both in the east and west, in the tenth century.

CHOREPISCOPUS* is also the name of a dignity still subsisting in some cathedrals, particularly in Germany; signifying the same with *Chori Episcopus*, or bishop of the choir.

* The word, in this sense, does not come from *χορηγος*, place, but *χορηγος*, choir, &c.

In the church of Cologne, &c. the first chantor is called *Chorepiscopus*.

CHOREUS, *Χορεύς*, a foot in the ancient poetry, more commonly called *Trocheus*. See TROCHEE.

CHORIAMBUS, in the Latin poetry, a foot compounded of a chorueus, or trocheus, and an iambus. See FOOT.

It consists of four syllables; of which the first and last are long, and the two middle ones short: as *ΕΙΛΑΒΑΙ*.

CHORION*, the exterior membrane which invests the foetus in the womb.

* The word comes from the Greek *χορηγος*, capere, to contain.

It is very thick and strong; on the inside, where it joins another membrane, called *Ammios*, very smooth; but rough and uneven without side; interspersed with a great number of vessels, and fastened to the matrix, or womb, by means of the placenta, which adheres very closely to it.

This membrane is found in all animals.

The *Chorion*, with the amnios and placenta, make what we call the *Secundine*, or after-birth. See SECUNDINE.

CHORIST, or **CHORISTER**, a chantor, or singer in the choir. **CHOROBATES***, a kind of water level, used among the ancients; composed of a double square, in form of a T, described by Vitruvius.

* The word comes from the Greek *χορηγιστης*, to over-run a country.

CHOROGRAPHY*, the art of making a map, or description of some country or province.

* The word comes from the Greek *χορηγος*, region, country, place.

Chorography is distinguished from Geography, as the description of a particular country, is from that of the whole earth. See GEOGRAPHY.

From *Topography* it is distinguished, as the description of the same country is from that of a single place, town, or district in it.

CHOROIDES*, or **CHOROIDES**, in anatomy, a term applied to several parts of the body; bearing some resemblance to the chorion.

* The word is formed from the Greek *χορηγος*, chorion, and *ειδος*, image, likeness.

CHOROIDES is particularly used for the inner membrane which immediately invests the brain; so called as being intermingled with a great number of blood-vessels, like the chorion; but more usually denominated the *pia mater*, or *meninx tenuis*.

Plexus, or *Lacis CHOROIDES*, is a knot of veins and arteries in the anterior ventricle of the brain, wove out of the branches of the carotid.

CHOROIDES is also applied to the inner, and posterior tunic of the eye, immediately under the sclerotica.

It is soft, thin, and black; and its inner, or concave surface, is very smooth and polite.—It has its name from its being interperfed with vessels.—Its anterior part is called the *Uvea*.

M. Mariotte maintains, that vision is performed rather in the *Choroidea* than the retina: in which he agrees with Bar. Torinus, and is seconded by M. Mery; but most other authors are of a different sentiment.

Next under the *Choroidea* is the retina. Ruysch, indeed, says, he has found another tunic between the *Choroidea* and retina; and denominates it from himself, *Tunica Ruyschiana*. He adds, that it grows so firmly to the *Choroidea*, that it is overlooked in the common dissections.

But Verheyen, though he found the *Choroidea* of a bird divisible into two membranes, could never separate those of the human eyes; and therefore he thinks there needed not any new name.

The *Choroidea* is black in men; in lions, camels, bears, sheep, cattle, dogs, cats, and most fishes, it is of a shining colour, like the brilliancy of silver, or the lustre of oriental pearl; and makes what naturalists call the *Tapis*, or colour of the eye.

CHORUS, in dramatic poetry, one, or more persons, present on the stage during the representation, and supposed to be bystanders thereto, without any particular share or interest in the action.

Tragedy in its origin, M. Dacier observes, was no more than a single *Chorus*, who trod the stage alone, and without any other actors; singing dithyrambics, or hymns in honour of Bacchus. Thespis, to relieve the *Chorus*, added an actor, who rehearsed the adventures of some of their heroes. Aeschylus, finding a single person too dry an entertainment, added a second; and at the same time greatly reduced the singing of the *Chorus*, to make more room for the recitation.

Every thing introduced between the four songs of the *Chorus*, they called by the term *Episodæ*; and those four songs made the four intervals, or acts of the piece.

But when once tragedy began to be formed, those recitatives, or episodes, which at first were only intended as accessory parts, to give the *Chorus* a breathing time, became now the principal parts of the performance: and whereas, before, they were taken from various subjects, they were now all drawn from one and the same.

The *Chorus*, by degrees, became inserted and incorporated into the action, to which at first it was only intended as an addition or ornament. Sometimes the *Chorus* was to speak, and then their chief, whom they called *Coryphæus*, spoke in behalf of all the rest: The singing was perform'd by the whole company; so that when the *Coryphæus* struck into a song, the *Chorus* immediately joined him.

Besides the four songs, which made the division of the piece, and which were managed by the *Chorus*, the *Chorus* sometimes, also, joined the actors in the course of the representation, with their plaints and lamentations; on occasion of any unhappy accidents that befel them.

But the proper function of the *Chorus*, when tragedy was formed, and that for which it seemed chiefly retained, was to shew the intervals of the acts: while the actors were behind the scenes, the *Chorus* engaged the spectators; their songs usually turned on what was just exhibited; and were not to contain any thing but what was suited to the subject, and had a natural connection with it: so that the *Chorus* concurred with the actors for advancing the action.

It is a fault observed in Euripides's tragedies, that his *Chorus's* are detached from the action, and not taken from the same subject. There were some other poets, who to save the pains of composing *Chorus's*, and adapting them to the piece, contented themselves with invented songs, which had no relation at all to the action. These foreign *Chorus's* were the less pardonable, as the *Chorus* was esteemed to act a part in the piece; and to represent the spectators, who were looked on as interested therein; inasmuch that the *Chorus* was not always to be mute, even in the course of the acts. In the modern tragedies, the *Chorus* is laid aside; and the musick supplies its place. M. Dacier looks on this retrenchment as of ill consequence; and thinks it robs tragedy of a great part of its lustre. He adds, that it is ridiculous to have a tragic action broke, and interrupted by impertinent flourishes from the music box: and to have the spectators who are supposed to be moved by the representation, become all of a sudden calm and easy, break off at the height of a passion, and amuse themselves peaceably with a foreign entertainment. The re-establishment of the *Chorus* he judges necessary, not only for the embellishment and regularity of the piece; but also, in regard it was one of its principal functions, to redress and correct any extravagancies that might fall from the mouths of the actors, when under any violent passion, by prudent, and virtuous reflections.

That which occasioned the suppression of the *Chorus*, was its being incompatible with certain complots, and secret deliberations of the actors. For it is in no wise probable, that such machinations should be carried on in the eyes of persons interested in the action. As the *Chorus*, therefore, never went off the stage, there seemed a necessity of laying it aside, to give the greater probability to these kind of intrigues, which require secrecy. M. Dacier observes, there was a *Chorus*, or *grego*, also in the ancient comedy; but this too is suppressed in the new: chiefly because it was made use of to reprove vices, by attacking particular persons.

The *Chorus* in comedy was at first no more than a single person, who spoke in the ancient compositions for the stage; the poets, by degrees, added to him another; then two, afterwards three, and at last more: so that the most ancient comedies had nothing but the *Chorus*, and were only so many lectures of virtue.

To give the *Chorus*, among the Greeks, was to purchase a dramatic piece of the poet, and defray the expences of its representation.

The person who did this was called *Choragus*. At Athens, the office of choragus was imposed on the archon; and at Rome on the *Aediles*.

CHORUS is likewise used in musick, where, at certain periods of a song, the whole company are to join the finger, in repeating certain couplets, verses, or clauses.

CHOSE, *Thing*, this word in law, is used in various circumstances, and with various epithets; as,

CHOSE in Action, is not any thing corporeal, but only a right, *q. g.* an annuity, obligation, covenant, &c.

Chose in Action, may also be called *Chose in Suspence*, as having no real existence, and not being properly in possession.

CHOSE Local, is something annexed to a place, *v. g.* a mill.

CHOSE Transitory, something moveable, and which may be transported from place to place.

CHRISM, *Χρῖσμα*, oil consecrated by the bishop, and used in the Romish, and Greek churches, in the administration of baptism, confirmation, ordination, and extreme unction.

The *Chrism* is prepared on Holy Thursday with a world of ceremony. In Spain, it was antiently the custom for the bishop to take one third of a sol for the *Chrism* distributed to each church; on account of the balsam that entered its composition.

Du Cange observes, there are two kinds of *Chrism*; the one prepared of oil and balsam, used in baptism, confirmation, and ordination; the other of oil alone, consecrated by the bishop, used antiently for the catechumens, and still in extreme unction.

The Maronites, before their reconciliation with Rome, besides oil and balsam, used musk, saffron, cinnamon, roses, white frankincense, and several other drugs mentioned by Rynaldus, in 1541, with the doses of each. The jesuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a synod held there in 1596, that *Chrism*, for the future should be made only of two ingredients, oil and balsam; the one representing the human nature of Jesus Christ, the other his divine nature. The action of imposing the *Chrism*, is called *Chrismation*: this the generality of the Romish divines hold to be the next matter of the sacrament of confirmation.

The *Chrismation* in baptism, is performed by the priest; that in confirmation by the bishop: that in ordination, &c. is more usually fitted *Unction*.

CHRISM Pence, *CHRISMATIS Denarii*, or *CHRISMALES Denarii*, a tribute antiently paid to the bishop by the parish clergy, for their *Chrism*, consecrated at Easter for the ensuing year: this was afterwards condemned as simoniacal.

CHRISOM, *CHRISMALE*, was antiently the face-cloth, or piece of linnen laid over the child's head when it was baptized.

Whence, in our bills of mortality, children who die in the

month are called *Chrifoms*.—The time between the child's birth and baptism, was also called *Chrifomas*.

CHRIST *, an appellation usually added to Jesus: and, together therewith, denominated the *Messiah*, or saviour of the world. See *MESSIAH*.

* The word in the original Greek *Χριστός*, signifies *Anointed*, of *Χρίω*, *Chrino*, I anoint.

Sometimes the word *Christ* is used singly, by way of antonomasia, to denote a person sent from God, an anointed prophet, or priest.

Order of CHRIST, a military order, founded in 1318, by Dionysius I. king of Portugal, to animate his nobles against the Moors.

Pope John confirmed it in 1320, and appointed the knights the rule of St. Bennet. Alexander VI. permitted them to marry. The order became afterwards insensibly reunited to the crown of Portugal; and the king took upon him the administration thereof.

The arms of the order are, gules, a patriarchal cross, charged with another cross argent. They had their residence, at first, at Caffromarin; afterwards they removed to the city of Thomar, as being nearer to the Moors of Andalusia, and Estramadura.

CHRIST is also the name of a military order in Livonia, instituted in 1205, by Albert bishop of Riga. The end of their institution was to defend the new christians who were converted every day in Livonia, but were persecuted by the heathens.

They wore on their cloaks a sword with a cross over it; whence they were also denominated *Brothers of the Sword*.

CHRISTENING. See the article *BAPTISM*.

CHRISTIAN, something that relates to Christ. See *CHRIST*. The king of France bears the title, or surname of the *Most Christian King*, *Rex Christianissimus*. The French antiquaries trace the origin of the appellation up to Gregory the great; who writing a letter to Charles Martel, occasionally gave him that title, which his successors have since retained.

Lambecius, in the III^d tome of his catalogue of the emperor's library, holds, that the quality of *Most Christian* was not ascribed to the antient French kings, Louis le Debonair, &c. as kings of France, but as emperors of Germany: but the French historians endeavour to refute this plea.

CHRISTIAN Church. See the article *CHURCH*.

CHRISTIAN Court, *Curia CHRISTIANITATIS*, denotes the ecclesiastical or bishop's Court; in contradistinction to civil courts, which are called *King's Courts*, *Curia Domini regis*.

CHRISTIAN Name, that given at baptism. See *NAME*.

CHRISTIAN Religion, that instituted by Jesus Christ.

CHRISTIAN is peculiarly and absolutely used for a person who believes in Christ, and is baptized in his name.

The name *Christian* was first given at Antioch, to such as believed in Christ, as we read in the acts: till that time they were called *Disciples*.

CHRISTIANS of St. John, a corrupt sect of *Christians*, very numerous in Baffora, and the neighbouring towns.

They formerly inhabited along the river Jordan, where St. John baptized; and it was thence they had their name. But after the Mahometans became masters of Palestine, they retired into Mesopotamia and Chaldaea.

They hold an anniversary feast of five days; during which, they all go to their bishops, who baptize them with the baptism of St. John: their baptism is always performed in rivers, and that only on fundays.

They have no notion of the third person in the trinity; nor have they any canonical books, but abundance full of charms, &c. Their bishopricks descend by inheritance, as our estates do; though they have the ceremony of an election.

CHRISTIANS of St. Thomas, or *San Thoma*, a sect of antient *Christians*, found in the East-Indies, when the Europeans touched at the port of Calcut; who pretend to be descended from those S. Thomas converted in the Indies: whence the name.

The natives call them, by way of contempt, *Nazarenes*; their more honourable appellation is *Mappuleym*. See *THOMEAN*.

Some learned men in Europe say, it was not St. Thomas the apostle that converted that country, but another St. Thomas: others say, it was a Nestorian merchant, called *Thomas*. It is certain they are Nestorians, and have been so a long time; inasmuch, that *Christians* of St. Thomas, now passes for the name of a sect.

They have a patriarch, who resides at Mosul.—The pope has made several attempts to reduce them under his obedience, but to no purpose.

CHRISTMASS, the feast of the nativity of Jesus Christ.

It appears from S. Chrysostom, that in the primitive times, *Christmasts* and Epiphany were celebrated at one and the same feast: that father observes, it was but of a little while that *Christmasts* had been celebrated at Antioch on the twenty-fifth of December, as a distinct feast; and that the use thereof came from the west. He adds, that the Armenians made but one feast of them, as low as the XIIIth century.

mong the people of fashion in Turkey, and some even in the seraglio.

CHURCH, an assembly of persons united by the profession of the same Christian faith, and the participation of the same sacraments.

Bellarmin, and the Romish divines, to this definition add, *Under the same pope, sovereign pontiff, and vicar of Jesus Christ on earth*: in which circumstance it is that the Romish, and reformed notion of *Church* differ.

Amelotte, and others, make a visible head, or chief, essential to a *Church*: accordingly, among the catholics, the pope; in England the king, are respectively allowed heads of the *Church*. Bishop Hoadly sets aside the notion of a visible head: Christ alone, according to him, is head of the church; which position he has maintained with great address, in a celebrated sermon before the late king on those words, *My kingdom is not of this world*; and in the several vindications thereof.

Sometimes, we consider *Church* in a more extensive sense, and divide it into several branches.—The *Church Militant* is the assembly of faithful on earth.—*Church Triumphant*, that of the faithful already in glory.—To which the catholics add the *Church Patient*, which, according to their doctrines, is that of the faithful in purgatory.

The term *ecclesia*, *ἐκκλησία*, synonymous with our *Church*, is used in the Greek and Latin profane authors for any kind of public assembly; and even for the place where the assembly is held. The sacred and ecclesiastical writers sometimes also use it in the same sense; but ordinarily they restrain the term to the Christians; as the term *synagogue*, which originally signifies nearly the same thing, is in like manner restrained to the Jews.

Thus, in the new testament, the Greek *ἐκκλησία*, signifies almost always, either the place destined for prayer, as 1 Cor. xiv. 34. or the assembly of the faithful diffused over the whole earth, as Ephes. v. 24. or the faithful of a particular city, or province, as 2 Cor. viii. 1, 2. or even of a single family, as Rom. xvi. 1. or the pastors or ministers of a *Church*, as Matt. xviii. 17.

The christian *Church* is frequently divided into Greek and Latin. *Greek, or Eastern Church*, comprehends the *Churches* of all the countries antiently subject to the Greek, or eastern empire; and through which their language was carried; i. e. all the space extended from Greece to Mesopotamia and Persia, and thence into Egypt; which has been divided ever since the time of the emperor Photius, from the Roman *Church*.

Latin, or Western Church, comprehends all the *Churches* of Italy, France, Spain, Africa, the north, and all other countries whither the Romans carried their language.

Great-Britain, part of the Netherlands, of Germany, and of the north, have been separated hence ever since the time of Henry VIII. and constitute what we call the *Reformed Church*, and what the Romanists call the *western schism*; as the Greek *Church* does the eastern one.

The *Reformed Church* is again divided into the *Lutheran Church*, The *Calvinist Church*, the *Church* of England, &c.

CHURCH is also used for a christian temple, built and consecrated to the honour of God; and, antiently, under the invocation of some particular saint, whose name it assumed.

In this sense, *Churches* are variously denominated, according to their rank, degree, discipline, &c. as *Metropolitan Church*, *Patriarchal Church*, *Cathedral Church*, *Parochial Church*, *Cardinal Church*, &c. See each under its proper article, *METROPOLIS*, *PATRIARCH*, *CATHEDRAL*, *PAROCHIAL*, *CARDINAL*, &c. In ecclesiastical writers, we meet with *Grand Church*, for the chief church of a place; particularly in the Greek liturgy, for the *Church* of S. Sophia at Constantinople, the see of the patriarch, founded by Constantine, and consecrated under Justinian: It was at that time so magnificent, that Justinian is said to have cried out in the consecration thereof, *ἐκκλησίαν ἱεροδομῶν, I have out-done thee, Solomon*. The dome, which is said to have been the first that was built, is 330 foot diameter. The first *Church* publicly built by the christians, some authors maintain to be that of S. Saviour at Rome; founded by Constantine: others contend, that several *Churches* abroad, called by the name of S. Peter *Prætorii*, were built in honour of that apostle during his life-time.

Mother-CHURCH, matrix ecclesia.

CHURCH, with regard to architecture, Daviler defines a large oblong edifice, in form of a ship, with nave, choir, isles, chapel, belfry, &c. See each part under its proper head.

Simple Church, is that which has only a nave and a choir.

CHURCH with Isles, that which has a row of porticos, in form of vaulted galleries with chapels in its circumference.

CHURCH in a Greek Cross, that where the length of the traverse part is equal to that of the nave; so called, because most of the Greek *Churches* are built in this form.

CHURCH in a Latin Cross, that whose nave is longer than the cross part, as in most of the Gothic *Churches*.

CHURCH in Rotondo, that whose plan is a perfect circle, in imitation of the Pantheon.

For the form of the antient Greek *Churches*, when they had all their parts, it was as follows: first was a porch, or portico,

called the *nauni-nave*, *ναυνη*, this was adorned with columns on the outside, and on the inside surrounded with a wall; in the middle whereof was a door, through which they passed into a second portico. The first of these porticos was destined for the Eucharist, and penitents in the first stage of their repentance; the second was much longer, destined for penitents of the second class, and the Catechumens, and hence called *ναυνη*, *ferula*; because those placed in it began to be subject to the discipline of the *Church*. These two porticos took up about one third of the space of the *Church*. From the second portico, they passed into the *nave*, *ναος*, which took up near another third of the *Church*. In the middle, or at one side of the nave, was the ambo, where the deacons and priests read the gospel and preached. The nave was destined for the reception of the people, who here assisted at prayers.

Near the entrance of this was the baptistery, or font. See **BAPTISTERY** and **FONT**.

Beyond the nave was the choir, *χορος*, set with seats, and round: the first seat on the right, next the sanctuary, being for the cantor, or choragus.

From the choir, they ascended by steps to the sanctuary, which was entered at three doors. The sanctuary had three apses in its length; a great one in the middle; under which was the altar, crowned with a baldachin, supported by four columns: See **SANCTUARY**, **BALDACHIN**, &c. Under each of the small apses, was a kind of table, or cupboard, in manner of a buffet.

Though, of the Greek *Churches* now remaining, few have all the parts above described; most of them having been reduced to ruins, or converted into mosques.

M. Frezier, engineer to the French king, and F. Cordemoy, a regular canon, have disputed the form of the antient and modern *Churches*, and the best manner of building them, with a good deal of learning, in the journals de Trevoux.

For the form of the Latin *Churches*, though it be various, yet may all the variety be reduced to two heads; viz. those in form of a ship, and those of a cross.

CHURCH-YARD, a sacred place adjoining to a *Church*, destined for the interment of the deceased. See **COEMETERIUM**.

CHURCH-GOVERNMENT, Discipline, &c. See **ECCLESIASTICAL, GOVERNMENT, DISCIPLINE, POLICY, &c.**

CHURCH-REVES. See the article **CHURCH-WARDENS**.

CHURCH-SCOT, or CHURCHESSET, a payment, or contribution, by the Latin writers frequently called *primitia* *seminum*; being, at first, a certain measure of wheat, paid to the priest on St. Martin's day, as the first-fruits of harvest.

This was enjoined by the laws of king Malcolm IV. and Canut. c. 10. But after this, *Church-Set* came to signify a reserve of corn-rent paid to the secular priests, or to the religious; and sometimes it was taken in so general a sense as to include poultry, or any other provision that was paid in kind to the religious.

CHURCH-WARDENS, antiently called *CHURCH-REVES*, are officers chosen yearly in easter week, by the parson and his parishioners, according to the custom of the place; to look to the *Church*, *Church-yard*, *Church-revenues*, &c. observe the behaviour of the parishioners with regard to faults that come under the jurisdiction of the ecclesiastical court; prevent scandalous livors to the bishop; take care none preach without license, &c. The *Church-wardens* are a kind of corporation; and are enabled by law to sue, and be sued for any thing belonging to the *Church*, or the poor of the parish.

CHYLE*, in the animal economy, a whitish juice, into which the food is immediately converted by digestion, or more properly, by that first branch thereof called *Chylification*.

* The word comes from the Greek *χυλος*, *juice*.

The *Chyle*, Dr. Drake observes, is nothing but a mixture of the oily and aqueous parts of the food, incorporated with the saline ones; which, while they yet remain mixed with the grosser parts in the stomach, make a thick, whitish, partly fluid mass, called *Chyme*: which, as soon as it is reduced to a consistence loose enough to be obedient to the pressure and peristaltic motion of the stomach, is gradually thrust out at the pylorus into the duodenum, and then is denominated *Chyle*.

Thus is the *Chyle* begun to be formed in the stomach: It is perfected in the intestines by the mixture of the bile and the pancreatic juice; and is thence received into the lacteal veins, which carry it to the receptaculum chylis, or Pecquet's reservoir: thence it passes into the thoracic duct, which terminates in the left subclavian vein: in this vein, the *Chyle* first begins to mix with the blood; into which it is afterwards converted by the action called *angustification*.

Some of the antients supposed the *Chyle* was changed into blood in the liver; others of them in the heart: but the moderns, with more reason, take the change to be effected by the blood itself, in all the parts of the body.

Some take *Chyle* to be the immediate matter of nutrition; others the blood.

CHY

Dr. Lister is of opinion, that in the digestion of meat in the stomach, there is made a separation, or solution of urinous salts, no otherwise than in the rotting of plants, or animals: that the *Chyle* is highly impregnated with this urinous salt; that it owes its whiteness to the fermentation it acquires from that mixture: that the salt *Chyle* is conveyed into the venal blood, and with it enters the heart; and is thence thrown out *Chyle*, as it comes in, by a continual pulsation, into the arteries: that as oft as it enters the emulgent arteries, it leaves behind part of its saline liquor, or urine, and consequently abates of its colour: and that when sufficiently freed of its salts, it becomes a lymph; which seems to be nothing else but the residue of the *Chyle* not yet converted into blood; as not yet sufficiently depurated of its saline particles. See *LYMPHA*.

CHYLIFICATION, the formation of the *Chyle*; or the act whereby the food is changed into *Chyle*. See *FOOD*, and *CHYLE*.

Chylification is begun by comminuting, or breaking the aliment in the mouth, mixing it with saliva, and chewing it with the teeth.

By such means, the food is reduced into a kind of pulp, which falling through the oesophagus into the warm stomach, there mixes with the juices thereof; and being thus diluted, begins to ferment, or putrify, and assumes a very different form from what it had before; growing either acid or rancid.

Here it mixes with a juice separated from the blood by the glands of that part, whose excretory ducts open into the stomach; as also with the remains of the former aliment: and thus it becomes better macerated, diluted, dissolved, and acquires still a greater likeness to the animal fluids, and is called *Chyme*.

Add to this, that the fleshy membrane of the stomach continually contracting and pressing its contents by its peristaltic motion, occasions a more intimate mixture, and by degrees works the more fluid parts through the pylorus into the duodenum; along the sides whereof, and the rest of the intestina tenuia, the lacteals are planted; into the minute orifices whereof, the finer parts of the mass is received.

The fabric of the stomach being considered, the heat of the circumambient parts, the pulsations of innumerable arteries, the great trophics of the aorta underneath, the constant compression of the diaphragm and abdominal muscles; it must necessarily follow, that the finer parts of the aliment will be first expelled the stomach; and that the grosser will remain; till, by the repeated action of the fluids, and the contraction and pulsation of the solids, they also become fine enough to go off: thus is the stomach left empty; and by means of its muscular coat, reduced to a state of contraction, and appetite is renewed.

Thus will even the fleshy membranes, cartilages, &c. of animals fed on, be squeezed, and be obliged to give out their juices; and thus is a fluid obtained, that shall have in some measure the same properties with those of our bodies.

This juice being got through the pylorus into the intestines, its liquefaction is still promoted by its mixture with two other dissolvents, the pancreatic juice and the bile; which divide and subtilize those parts that were left too gross; and by the peristaltic motion of the guts it is protruded forwards. In the passage through the small intestines, the finer part of the mass, which we call the *Chyle*, enters the orifices of the lacteal veins of the first kind, wherewith the whole mesentery is intermixed; which either alone, or together with the mesaraic veins, discharge themselves into the glands at the basis of the mesentery.

Then the *Chyle* is taken up by the lacteals of the second kind, and is conveyed into glands between the two tendons of the diaphragm, known heretofore under the name of the *lumbar* glands, now called *Pecquet's* reservoir; whence it is carried to the heart by the thoracic duct and the subclavian vein; wherein it begins to be mixed with the blood, and to circulate, and in time becomes assimilated thereto.

CHYLOSIS, *Χυλωση*, in medicine, the action whereby the aliment is converted into *Chyle*, or *Chyme*, in the stomach, &c. whether it be by a ferment in the stomach, or the contractile force of the stomach, or both.

CHYME, *Χυμος*, an animal juice, which is according to some the same with that commonly called *Chyle*. See *CHYLE*.

Some, however, distinguish between *Chyme* and *Chyle*; restraining the word *Chyme* to the mass of food, &c. while in the stomach, ere it be sufficiently comminuted and liquified to pass the pylorus into the duodenum, and thence into the lacteals, to be further diluted and impregnated with the pancreatic juice; where it commences *Chyle*.—And others distinguish and denominate them the contrary way.

CHYMISTRY*, or **CHEMISTRY**, the art of separating the several substances whereof mixed bodies are composed, by means of fire; and of composing new bodies in the fire, by the mixture of different substances or ingredients.

CHY

Chymia. Others, making *Cham* the inventor of *Chymistry*, derive the term from his name; supporting their etymology on the signification of the word *Cham*, which in the Hebrew signifies *heat, hot, black*; all of them bearing some relation to the operations of *Chymistry*. *Chymistry* is also known under various other names: it is sometimes called the *hermetical art*, from a supposition of its being invented by *Hermes Trismegistus*. Others call it, the *Egyptian art*, from the people among whom it was first practised: others the *sacred, or divine art*; and *Poiesis*, or the art of *making gold*, &c. Others call it the *spagyric art*: *Paracelsus*, the *hyssopic art*: and others *pyrotechnia*.

The chief object of *Chymistry*, is to analyse, or decompound natural bodies; reduce them to their first principles; discover their hidden virtues, and demonstrate their inner contexture, or the center, as they call it, wherein natural substances concur. In a word, *Chymistry* is the anatomy of natural bodies, by means of fire; which is the definition *Hanneman* gives us of the art.

Boerhaave defines *Chymistry* more scientifically: 'An art whereby by sensible bodies contained in vessels, or capable of being contained therein, are so changed, by means of certain instruments, and principally of fire, that their several powers and virtues are thereby discovered, with a view to philosophy, medicine, &c.' This definition appears very prolix and circumstantial, and more like a description than a definition; but with all his endeavours, that author assures us, he could not frame a shorter that would express the full scope, objects, and instruments of *Chymistry*, so as to distinguish it from every other art: which is a point all the writers of *Chymistry* have stumbled at.

For *Chymistry* cannot justly be called the art of *resolving bodies*, as *Regius*, *Paracelsus*, &c. define it; since mechanics will also do that: nor is the matter mended, by saying, it is the art of *analysing bodies by fire*; as *Helmont* has done: nor by *salt*, as others would have it. These definitions include only a part, instead of the whole. And with as little propriety is it termed, the art of *separating the pure from the impure*; inasmuch as it compounds as well as separates, and frequently mixes the pure with the impure. *Chymistry*, on this footing, appears a very extensive art: Its object, or the *materia chymica*, is all sensible bodies, capable of being contained in vessels; and is accordingly divided into three kingdoms, *sessile, vegetable, and animal*.

The operations of *Chymistry*, include all the changes produced in bodies by natural agents or instruments, *viz. decoction, infusion, exhalation, calcination, extraction, distillation, crystallization*, &c.

The effects, or productions of *Chymistry*, may be reduced to *magisteries, extracts, tinctures, elixirs, and clysters*.

The instruments, or agents of *Chymistry*, whereby its operations are performed, are *fire, water, air, earth, menstruums, and instruments properly so called, as alembics, cucurbits, retorts, pelicans, furnaces, and lutes*.

Chymistry is an art of very great antiquity, and is held by some very learned persons to have been practised in the antediluvian world. *Cham*, the son of *Noah*, is commonly held to have been its inventor, from whom it is supposed to have taken its name. But others refer the invention to *Tubal Cain*, whom the scripture records as the inventor of instruments of brass and iron. This is pretty certain, that some of the highest and most difficult things in *Chymistry*, must have been known by him; among which are the separating and purifying of copper and iron, the making of brass, &c.

The first mention we find made of the art, is in *Zosimus*, the *Panopolite*, who lived about the year of Christ 400. 'In the sacred writings, says that author, we find certain *Genii* spoke of, who had commerce with women. *Hermes* says as much in his books upon nature; and scarce any author but has some footsteps of this tradition. These *Genii*, intoxicated with the love of women, discovered them all the secrets of nature; and taught them abundance of things unfit for them to know: for which reason they are banished from heaven. The book wherein their secrets was contained, was called *Chema*; and hence the name *Chemia*, or *Chymia*.'

The text of scripture *Zosimus* here refers to, is that passage in *Moses*, *The sons of God saw the daughters of men, and took them to wife*.

This antediluvian origin of *Chymistry* is confirmed by *Tertullian*: 'The angels that fell, says that father, discovered gold and silver to men, with the arts of working them, of dying wool, &c. for which reason they were banished, as is related by *Enoch*.'

Borrichius looks on these passages as authentic; but adds, that *Enoch* was mistaken, for that the angels he speaks of, were not real angels; but the descendants of *Seth* and *Tubal Cain*, who degenerating from their fathers, gave themselves up to criminal pleasures with the women descended from *Cain*; and in the course of their intrigues, divulged the secrets God had trusted them withal.

Be this as it will, *Chymistry*, no doubt, was first practised in *Egypt*. According to *Moses*, *Tubal Cain* should be the first inventor,

* Critics are divided as to the etymology of the name *Chymistry*: it is usually derived from the Greek *χυμος*, *juice*; or from *χημ*, *to melt*. *Boerhaave*, and others, more justly derive it from the Egyptian *Chema*, or *Kema*, *black*; and write it *Chemia*, not

ventor. Profane authors refer it to Vulcan; and some of the latest and best critics endeavour to shew, that Tubal Cain and Vulcan were the same; as, indeed, there is a great resemblance between their names.

After Tubal Cain, the first *Chymist* we read of is Moses; whose skill in *Chymistry* is incontestable, from his burning and pulverizing the golden calf the Israelites had set up, and giving it the people to drink. There being scarce a more difficult operation in all *Chymistry*, than to make gold potable.

Chymistry had the common fate of the other arts, at the declension of the eastern empire: and lay buried and forgot till the time of Roger Bacon, who retrieved it. He was followed by Lully, Ripley, Basil Valentine, Paracelsus, Van Helmont, Glauber, Boyle, Lemery, Homberg, &c. by whom the art has been carried to its present degree of perfection.

The first *Chymists* confined themselves to metals: in these latter ages, the bounds of *Chymistry* have been greatly enlarged; and plants, animals, minerals, &c. have been taken into it.

It is but of late that *Chymistry* has been applied to the preparation of medicines: Basil Valentine, and Arnoldus de Villa Nova, seem to have been the first that attempted it. Paracelsus and Van Helmont carried it to such a length, as to render medicine almost wholly *chymical*.

Chymistry is divided into *metallurgia*, *alchemy*, *chymical pharmacy*, and *chymical philosophy*. See METALLURGIA, ALCHEMY, &c. Some authors observe, that Dioclesian, after the taking of Alexandria, ordered all the books of *Chymistry*, antiently wrote by the Egyptians, for making gold and silver, to be sought out and burnt; that they might not have the power of enriching themselves by this art, or of putting themselves, by this means, into a condition of revolving again.

Authors on the subject of *Chymistry* are very numerous: Borel has published a catalogue of most of them, under the title of *bibliotheca chymica*; containing the names of above four thousand. Boerhaave is the latest, fullest, and apparently the best; he has given both the history, theory, and practice, in an orderly, and scientific way. Dr. Friend has reduced *Chymistry* to *Newtonianism*, and accounted for the reasons of the operations on mechanical principles.

CHYMOSIS*, *χυμωσις*, in medicine, the act of making, or preparing *Chyme*. See CHYME.

* The word comes from *χυμω*, *succus*, of *χμα*, *fundo*, I melt.

Chymosis, according to some, is the second of the concoctions made in the body; being a repeated preparation of the most impure and gross parts of the chyle, which being rejected by the lacteals, is imbibed by the mesenterics, and thence carried to the liver, to be there elaborated, purified, and subtilized afresh. It is of this, according to Rogers, that the animal spirits are formed.

CHYMOSIS*, or rather **CHEMOSIS**, is also used for an inflammation of the eyelids, which turns out their inside to sight.

* In which sense, the word comes from the Greek *χυμωσις*, *bisfo*, I gape.

CICATRICULA, in natural history, a little whitish speck, or vesicle, in the coat of the yolk of an egg; wherein the first changes appear towards the formation of the chick. The *Cicatricula* is what is otherwise called the eye of the egg. See EGG.

CICATRISIVE, **CICATRIZANS**, in medicine, is applied to such remedies as are very desiccative; and on that account aid nature to repair the skin, and to form a cicatrix, or eschar.

Such are Armenian bole, powder of tutty, and the unguents diaphorolygis, desiccativum rubrum, &c.

Cicatrificus medicines are otherwise called *escharotics*, *epulotics*, *incarnatives*, *agglutinants*, &c.

CICATRIX*, in medicine, &c. a little seam, or elevation of callous flesh, rising on the skin, and remaining there after the healing of a wound, &c. ordinarily called a *scar*, or *eschar*.

* Some derive the word from *cicra cutem*: others fetch *cicatrix* from *accicatrix*, the *cicatrix* being only *obdusio vulneris*, the covering up, or hiding of the wound: but it is better derived from *cacatrix*, which has the same force; of the verb *cacare*, to bind.

The *Cicatrix* is the same with regard to the joining of the fleshy parts, as a *callus* is to the bones.

In young infants, these callosities, or scars, sometimes much diminish, and oftentimes quite vanish when come to age, as is particularly observed in the pits of the small-pox: and, in growing, they are sometimes observed to change their situation.

CICUTA, a vegetable poison, celebrated as such both among antients and moderns.

The modern *Cicuta* is the plant hemlock; whereof there are two kinds: the *Cicuta*, absolutely so called, or *cicuta major*; and the *cicuta minor*.

The first grows in places a little moist, in the shade, among old ruins, or along roads.—So many unhappy effects have been experienced from it, that its use, internally, is by no means to be recommended: and yet some persons boast of it as a powerful sudorific. Externally it may be applied, to resolve wens, and hardiness of the spleen and liver. It is the basis of the plaister which bears its name.

Physicians have generally ranked it among the cold poisons; but the later writers, with more justice, regard it as an acrimonious dissolving, or hot poison: and say that it kills by corroding and lacerating the stomach. The reasons they give, as related by Wepper, are, that it bites the tongue; that the effluvia it yields are hot, and arise from a volatile salt, and an impure sulphur; that the madness it occasions, as well as the other symptoms, shew a great activity of parts; and that if the blood be found coagulated by it after death, spirit of wine also does the same. See Mead's Essay on Poisons.

The lesser *Cicuta* is not less dangerous than the greater; it is even supposed more violent, as well as more hafty in its operation.

Several persons have been rendered delirious, by eating porridge wherein this *Cicuta* has been infused of partly.—According to some, it has much such an enmity to the brain, as *cantharides* have to the bladder, and *scelus marinus* to the lungs.

CICUTA is also used, chiefly among the antients, for a poisonous juice, or liquor, expressed from a plant called *Cicuta aquatica*; being the common poison wherewith the state-criminals at Athens were put to death.

The *Cicuta* of the antients is a secret now scarce possible to be discovered. Wepper, in an express treatise on the subject, will have it the *Oenanthe cicuta facie*, *succo virido*; which he describes by the name of *cicuta aquatica*; and of the dismal effects of which he gives a very ample relation.—At least the violence of this plant makes it a much fitter instrument of hasty death than the common *cicuta* or hemlock, which is by much less malignant.—Though some have suggested, that the poisonous draught to which the Athenians doomed their criminals was an inspissated juice compounded of the juice of *Cicuta* and some other corrosive herbs. Vid. Mead's Essay on Poisons, ap. Bibl. Anal. Med. T. 3. p. 287.

Socrates drank the *Cicuta*.—Plato, in his dialogue on the immortality of the soul, observes, that 'The executioner advised Socrates not to talk, for fear of causing the *Cicuta* to operate too slowly.' M. Petit, in his *observations miscellaneæ*, remarks, that this advertisement was not given by the executioner out of humanity, but to save the *Cicuta*: for he was only allowed so much poison *per ann.* which if he exceeded, he was to furnish the rest at his own expence. This construction is confirmed by a passage in Plutarch: the executioner who administered the *Cicuta* to Phocion, not having enough, Phocion gave him money to buy more; observing, by the way, that it was odd enough, that at Athens a man must pay for every thing, even his own death. See Supplement, article **CICUTA** and **ENANTHE**.

CIDER, or **CYDER**, a brisk, tart, cool liquor, prepared from apples.

Manner of making CYDER. The fruit is first ground, or stamped, and the juice squeezed out in a press; then it is strained through a sieve, or other strile, and tunned up; the vessel is not to be full. For two or three days it is to be stopped loosely, then quite closed with clay. Henceforward, a small quantity is to be drawn out every day for some weeks, till such time as it is supposed pretty clear: then it is pierced, to see how fine it is; the summer fruit after a month; the gennet-moil, after the first frosts; the redstreak not till after January; and the other winter fruits about the same time.

If it be not now found fine enough, it stands a month longer; and if after this it be defective, it is racked off like wine, so as to keep out the air.

Some, instead of racking, fine it with ising-glass, steeped in white wine, and dissolved over the fire; this they boil in a quantity of the liquor to be fined, and then mix it with the rest: and others, instead of dissolving the ising-glass over the fire, let it steep in the white wine for about a month, in which time it dissolves into a jelly of itself: a quantity of this is mixed with some of the liquor, and the whole beat to a froth; then mingled, together with some broom, with the rest. The liquor once fine, it is drawn out, or bottled off, as occasion requires.

It is observed, that a mixture of fruits is a great advantage to *Cider*; the worst apples, mixed together, making as good *Cider* as the best make alone: always observing, however, that they be of equal ripeness.

The best mixture, according to Mr. Worlidge, is that of red-streaks with golden-reinets: bitter apples spoil the *Cider*, but the juice of them, and of crabs, yield as good spirits, as the best apples, when fermented: neither the four nor the bitter taste arising with the spirit upon distillation.

If the apples be pounded in a stone mortar, which is the custom of some, the kernels and stalks are bruised with them, which gives the liquor an ill flavour.

CIDERKIN, or **PURRE**, is a liquor made of the muck, or gross matter remaining after the *Cider* is pressed out.

For this purpose, the muck is put up in a large fat, with a proper quantity of boiled water, which has stood till it be cold again: if half the quantity of water be used that there was of *Cider*, it will be good; if the quantities be equal, the *Ciderkin* will be small. The whole is left to infuse forty-eight hours, and then well pressed: what is squeezed out by the press, is immediately tunned up and stopped; it is fit to drink in a few days.

It clarifies of itself, and serves in families instead of small beer. It will keep, if boiled after preflure, with a convenient quantity of hops.

CILIA, in anatomy, the hairs wherewith the palpebræ, or eyelids are fringed; especially the upper, which are larger and stiffer than those of the under.

Their use seems to be, to break the too fierce impression of the rays of light; as also to keep out flies and moats, and other things floating in the air, which might annoy the eye.

These *Cilia* spring from a small row of glands, which cover a thin tender cartilage, edging each eyelid, and serving as a kind of rod, or ring to stretch them upon.

CILIARE, in anatomy, an epithet given to a part of the eye, called *ligamentum ciliare*; because of its relation to the *cilia*, or hair of the eyelids.

The *ligamentum ciliare*, called also *processus ciliaris*, consists of a range of black fibres disposed circularly; having their rise in the inner part of the uvea, and terminating in the prominent part of the crystalline, which they encompass round.

Anatomists generally imagine their use to be to suspend the crystalline in the globe of the eye, to lengthen or shorten its figure, and bring it nearer to or further from the uvea; and even to open or contract the pupil as occasion requires, i. e. as near or remote objects, obscure or bright objects, are to be viewed.

The motion of the pupil, some say, is effected by the circular and strait fibres of the uvea; others attribute it to the *Ciliary* ligament: yet, there is no great doubt, but they both concur in the same action; and that the *ligamentum ciliare* doth, at the same time the pupil opens or shuts, dilate or compress the crystalline, and bring it nearer, or carry it further off the retina. Derham *phys. theol.*

M. Mariotte denies the *ligamentum ciliare* to have any connection with the crystalline, or to serve for any purposes thereof.

CILIARIS, in anatomy, a muscle, otherwise called *orbicularis palpebrarum*. See **ORBICULARIS**.

CIMA, or **SIMA**, in architecture, a member or moulding, called also *gee*, and *cymatium*.—See *Tab. Archit. fig. 8*.

CIMIER, in the French heraldry. See **CREST**.

CINCTURE *, or **CEINTURE**, in architecture, a ring, or list, at the top and bottom of the shaft of a column; separating the shaft, at one end, from the base; and at the other from the capital. See *Tab. Archit. fig. 28. and 24. lit. q. s.*

* The word in its original French signifies *girde*, of the Latin, *cingo*, I gird.—

That at bottom is peculiarly called *apophyse*; as if the pillar took its flight hence: and that at top, *colaris*, or collar.

The *Cincture* is supposed to be an imitation of the girths, or ferils, antiently used to strengthen and preserve the primitive wooden columns. See **ORDER**.

CINERATION, in chymistry, the reduction of wood, or any other combustible matter into ashes, by means of fire.—This, others call *cincifaction*.

CINERES. See the article **ASHES**.

CINERES Clavellati, among chymists, are the ashes of tartar, or lees of wine, burnt.

CINERITIOUS, a term applied to things resembling ashes; particularly in point of colour, and consistence.

Thus, the cortical part of the brain, is also called the *cineritious* part.

CINNABAR *, in natural history, a mineral substance, red, heavy, and brilliant; found chiefly in the quicksilver mines, and being one of the ores of that mineral.

* The word comes from the Greek *κινναβη*, the smell of goats; by reason, says Matthiolus, in digging one kind of mineral *Cinnabar*, it yields to strong a scent, that the diggers are obliged to stop their nostrils.

Some have wildly imagined *Cinnabar* to be dragon's-blood, gathered, as Pliny and Solinus have it, when the dragon and elephant fight together: this fable is refuted by Dioscorides, and Scaliger. See **DRAGON'S BLOOD**.

Cinnabar is either *native*, or *salutious*.

Native, or *Mineral CINNABAR*, which is that above-mentioned, is found in moist places where there are quicksilver mines.

It may be esteemed as an ore of quicksilver, or rather, as quicksilver petrified and fixed, by means of sulphur, and a subterraneous heat: chymistry being found to reduce it without much trouble or loss, to the nature of mercury. Each pound of good *Cinnabar* yields fourteen ounces of mercury. Accordingly, the principal property and use of this mineral, is to yield a most excellent mercury; and that which the alchymists maintain to be the best disposed for attaining to the transmutation of gold.

The best mineral *Cinnabar* is of a high colour, brilliant, and free from stony matter.—It is used by physicians in venereal cases, and others occasioned by sharp serosities. It is also esteemed a good cephalic, and accounted of service in epilepsies, and other

nervous distempers: add, that it is reckoned of efficacy in catenaceous cases, as the scurvy.

Salutious, or artificial **CINNABAR**, is formed of a mixture of mercury, and sulphur, sublimed, and thus reduced into a kind of fine red glebe.—The best is of a high colour, and full of fibres, like needles.

The method of preparing *salutious CINNABAR*, is thus.—They take sulphur, one part, melt it in a pipkin; then put to it, by a little at a time, three parts of quicksilver, stirring them together till no mercury appears: then letting them cool, they grind the mixture, put it in a bolt-head, bake it, and place it over a naked fire, which they augment by degrees; a coloured fume arises first to the top of the subliming vessel, which, in the further progress of the heat, becomes, at length, of a red, crimson hue. Taking it off the fire, the *Cinnabar* is found at top.

This serves for the same medicinal purposes with the *native Cinnabar*: besides which, it is likewise used by the farriers, to make pills for their horses; and by painters, as a colour: it being a very vivid red; but drying with some difficulty.

This *Cinnabar*, called also by the painters, *vermilion*, is rendered more beautiful by grinding it with gum-water, and a little saffron: this preventing its growing black. See **VERMILION**.

There is likewise a *blue Cinnabar*, made by mixing two parts of sulphur with three of quicksilver, and one of fal ammoniac: these being sublimed produce a beautiful blue substance; whereas quicksilver and sulphur alone produce a red. See *Supplement, article CINNABAR*.

The chymists prepare other kinds of artificial *Cinnabar*; as, *CINNABAR of Antimony*, a composition of mercury, common sulphur, and crude antimony, sublimed.

It is held a diaphoretic, and alterative; and is used in scrophulous and other chronic cases.

CINNAMON, an agreeable aromatic spice, brought from the East-Indies.

Cinnamon is allowed to be the bark of a tree, growing in the island of Ceylon, and, as some say, also in Java, and in Malabar.

The *Cinnamon-tree*, grows in woods, like other trees. It never rises high: its leaves resemble those of the laurel, both as to substance, and colour *. The flowers, when they first begin to open, are red as scarlet; and if rubbed between the hands, they yield an odour more like that of cloves than of *Cinnamon*. Seba says he found them blue, and of the bigness of the Italian bean flowers. The fruit resembles an acorn, or olive; and has neither the smell nor taste of the bark. When boiled in water, it yields an oil, which, as it cools and hardens, becomes as firm and white as tallow; and is called by the Dutch *Cinnamon wax*. Its smell is agreeable, and they make candles of it, which are only allowed to be burnt in the king's palace. It is also used in physic, as a balsamic and healer.

* The leaves of the *Cinnamon tree* are called *folia Malabatris*, and yield a bitterish aromatic oil, called *oleum Malabatris*, reputed excellent against cephalalgia, &c.

The chief virtue of the *Cinnamon tree* is in its bark; which, when green, appears to be double: its exterior surface being brownish, and the inner of the common *Cinnamon* colour.

It is then divisible into two barks of different colours; but these drying together become inseparable, and pass for the same bark; the brownish colour changing in proportion as it dries. When the *Cinnamon* is fresh taken from the tree, it is flat, and has little taste, smell, or colour; but it twists, or convolves, as it dries, in form of a stick, or cane: whence the French call it *canelle*.

By thus exhaling its superfluous humidity, it acquires a sweet brisk smell, and a sharp pungent taste. It is said, that after the tree has been stripped of its bark, in three years it forms a new one, which is as good as the first: but this is not very probable. The Ceylonese cut down their *Cinnamon trees* as soon as they are stripped, close to the root: and from the stump there spring up new ones, which, in 5 or 6 years time, become trees fit for barking.—A sort of pigeons which feed on the fruit of the *Cinnamon tree*, are the chief agents in propagating it. In carrying the fruit to a distance to their young, they drop it in various places, where it takes root. *Vid. Phil. Trans. N° 409. p. 104. seq.*

Some hold, that the small branches of the same tree make the *Cassia*; but that is a great mistake. See **CASSIA**.

The natives draw from the roots of the tree a liquor, which, as it hardens, in all respects resembles camphor; and which in reality is a true camphor.

Cinnamon, to be good, must have a brisk, agreeable taste, and a bright brown colour. Its qualities are, to heat and dry; to promote the menses, to fortify the spirits, and to help digestion: but its chief use, in medicine, is an astringent; with which intention it is prescribed in diarrheas, and weaknesses of the stomach.

The *Cinnamon* of the antients was different from that of the moderns; they distinguished five kinds of *Cinnamon*: the *malabatic*; *Cinnamon of the mountain*; black and branched *Cinnamon*;

mon; another white and spongy; and a fifth of less value, reddish, and of a strong smell: as also a *bastard Cinnamon*, called *zinziber*: this last species was antiently in very high esteem, but is now no longer known.

They extract an oil from *Cinnamon*, called its *essence*, or *quintessence*, which is an excellent cardiac: it is drawn by distillation, like the oils of other vegetables. Indeed, being heavier than most other essential oils, it requires a greater heat to raise it. And for the same reason it sinks to the bottom of the water that comes over with it into the receiver, whereas others swim a-top, the essential oils of cloves, saffras, guaiacum, and box, excepted. The Dutch are said to have a method of preparing, or rather, adulterating oil of *Cinnamon*, which is kept a secret among themselves. And the common *Cinnamon* is often adulterated with that out of which this essence has been extracted.

Cinnamon, by means of fire, furnishes, beside its oil, waters, extracts, and salts; out of which are compounded syrups, and pastills, called *oleo-sacchara*; together with an essence, that serves to turn all manner of wines, white and red, into hypocras.

CINNAMON-WATER, is made by distilling the bark, (first infused for some days) in spirit of wine, brandy, or white-wine. All the *Cinnamon* consumed in Europe, comes from the Dutch; who have got the whole commerce thereof in their own hands, by becoming masters of the Isle of Ceylon, and destroying all the other *Cinnamon* trees about the kingdom of Cochin.

Clove CINNAMON, is also the bark of a tree growing in Brazil and Madagascar; where it is known under the name of *ra-vensdara*. The Portuguese call it *crêvo de marenham*.

This bark, pulverized, is sometimes substituted for real cloves, though far short of them in respect of flavour.

Saffras, is sometimes also called *Cinnamon-wood*. See *SASSAFRAS*.

White CINNAMON, which some call *costus corticus*, or *corticus*, or *cortex Winteri*, *Winter's bark*, from the person's name who first brought it into England; is the bark of a tree resembling the olive tree, frequent in the islands of S. Domingo, Guadalupe, and Madagascar; called by the natives *simple*.

This bark, which dries like that of *Cinnamon*, is at first brownish, of a sharp biting taste, like pepper; and a smell like musk: as it dries it whitens.—Some use it in lieu of nutmeg: and in medicine, it is used as a stomachic, and sometimes as an antiscorbutic.

The same tree also yields a gum, called *alouch*, sometimes *bdellium*, which is no disagreeable perfume. See *Supplement*, article *CINNAMOMUM*, and *WINTERANUS CORTEX*.

CINQUE-PORTS, *Quinque ports*, five havens that lie on the east part of England, towards France; thus called, by way of eminence, on account of their superior importance; as having been thought by our kings to merit a particular regard, for their preservation against invasions.

Hence, they have a particular policy, and are governed by a keeper, with the title of *Lord-warden of the Cinque ports*.

They have various privileges granted them, as a particular jurisdiction; their warden having the authority of an admiral among them, and sending out writs in his own name.

Camden tells us, that William the conqueror first appointed a warden of the *Cinque-ports*; but King John first granted them their privileges; and that upon condition they should provide eighty ships at their own charge for forty days, as often as the king should have occasion in the wars: he being then straitened for a navy to recover Normandy.

These five ports are Hastings, Romney, Hythe, Dover, and Sandwich.—Thorn tells us, that Hastings provided twenty-one vessels; and in each vessel twenty-one men. To this port belong Seaford, Pevensey, Hedney, Winchelsea, Rye, Hamne, Wakebourne, Creneth, and Forthelipe.—Romney provided five ships, and in each twenty-four men. To this belong Bromhal, Lyde, Olwarthone, Dangemares, and Romanhal.—Hythe furnished five ships, and in each twenty-one seamen. To this belongs Westmeath.—Dover the same number as Hastings. To this belong Folkton, Feverham, and Marge.—Lastly, Sandwich furnished the same with Hythe. To this belong Fordwic, Reculver, Serre, and Deal.

CION, or *CYON*, in gardening, a young shoot, sprout, or sprig, put forth by a tree.

Grafting is performed by the application of the *Cion* of one plant upon the stock of another.

To produce a stock of *Cions* for grafting, planting, &c. the gardeners sometimes cut off the bodies of trees, a little above the ground, and only leave a stump or root standing: in this case the redundant sap will not fail next spring to put forth a great number of shoots.

In dressing dwarf-trees, a great many *Cions* are to be cut off. See *DWARF*; see also *PRUNING*.

CION, in anatomy, is sometimes used for the uvula. See *UVULA*. *CIPHER**, or *CYPHER*, one of the numeral characters, or figures; formed thus, o.

* The word *Cipher*, comes from the Hebrew *Sifre*, number, enumeration.

The *Cipher* of itself implies a privation of value; but when

disposed with other characters on the left thereof, in the common arithmetic, it serves to augment each of their values by ten; and in decimal arithmetic, to lessen the value of each figure to the right thereof, in the same proportion.

CIPHER, denotes also a kind of enigmatic character, composed of several letters interwoven; which are ordinarily the initial letters of the persons names, for whom the *Cipher* is intended.

These are frequently used on seals, coaches, and other moveables.—Antiently, merchants and tradesmen were not allowed to bear arms: in lieu thereof, they bore their *Ciphers*, or the initial letters of their names, artfully interwove about a cross; of which we have divers instances on tombs, &c.

CIPHER is also applied to certain secret characters, disguised and varied; used for the writing of letters that contain secrets not to be understood by any but those between whom the *Cipher* is agreed on. This is now reduced into a separate art, called, *Cryptographia*, *Polygraphia*, and *Steganographia*; but it appears to have been little known to the antients.

De la Guilletiere, in his *Lacedæmon antient and modern*, endeavours to make the antient Spartans the inventors of the art of writing in *Cipher*.

Their scytala, according to him, was the first sketch of this mysterious art: these scytale were two rollers of wood, of equal length and thickness; one of them kept by the ephory; the other by the general of the army sent on any expedition against the enemy.

Whensoever those magistrates would send any secret orders to the general, they took a slip of parchment, and rolled it very justly about the scytala which they had reserved; and in this state wrote their intentions, which appeared perfect and consistent while the parchment continued on the roller: when taken off, the writing was maimed, and without connection; but it was easily retrieved by the general, upon his applying it to his scytala. Polybius says, that *Aeneas Tacticus*, 2000 years ago, collected together twenty different manners of writing so as not to be understood by any but those in the secret; part whereof were invented by himself, and part used before his time.—*Trithemius*, *Bap. Porta*, *Vigenere*, and *P. Nicéron*, have wrote expressly on the subject of *Ciphers*.

As the writing in *Cipher* becomes an art; so is the reading, or unravelling thereof, which is called *deciphering*. See *DECIPHERING*.

CIPHER with a single Key, is that wherein the same character is constantly used to express the same word, or letter: this is easily deciphered with a little application.

CIPHER with a double Key, is that wherein the alphabet, or key is changed in each line, or in each word; and wherein are inserted many characters of no significance, to amuse and perplex the meaning.

CIPHERING, or *CYPHERING*, is popularly used for the art of accounting; properly called *arithmetic*.

CIPPUS, among antiquaries, a little, low column, erected in roads, or other places, with an inscription thereon; either to shew the way to travellers, to serve as a boundary, or preserve the memory of something remarkable, and particularly the grave of a defunct.

The *Cippi* placed in the highway, for the convenience of travellers, were more properly called *military columns*. See *MILITARY Column*.

Hottinger has an express treatise of the *Cippi* of the Jews, *de cippiis hebraeorum*; wherein he takes *Cippus* for the tomb-stone of a defunct.

CIPPUS was also used in antiquity, for a wooden instrument, wherewith criminals and slaves were punished; being a kind of clog, or stocks for the feet.

CIRCELLIONES. See *AGONISTIC*.

CIRCENSES Ludi, *CIRCENSESIAN Games*, or *Games of the Circus*, a general term, under which were comprehended all combats exhibited in the Roman *Circus*, of what kind soever; whether on foot, on horseback, or in a car; wrestling, or boxing; with swords, pikes, darts, or arrows; against men, or against beasts; on the ground, or aboard vessels.

There were few except slaves that gave the people this cruel pleasure: it was an exercise that would have disgraced people of any account. See *GLADIATOR*.

Some say, the *Circensian Games* were so called from the Latin *Circumensis*; because they were held in a place incircumfused round with naked swords, that the combatants might not have an opportunity of escaping.

At first they are said to have been exhibited on the brink of the river Tyber, and the ground incircumfused, to the landward, with naked swords.

Most of the feasts of the Romans were accompanied with *Circensian Games*; and the magistrates, or other officers of the republic, frequently presented the people with them on other occasions.—The grand ones were held for five days, commencing on the 15th of September.

CIRCLE, *CIRCULUS*, in geometry, a plane figure, comprehended under one single line, which returns into itself; having a point in the middle, from which all the lines drawn to its circumference are equal.

Properly speaking, it is the space included within the circumference,

CIR

CIR

rence, or periphery, that is the *Circle*: tho' in the popular use of the word, *Circle* is frequently used for the periphery alone. Every *Circle* is supposed to be divided into 360 degrees.

The area of a *Circle*, is found by multiplying the periphery by the fourth part of the diameter; or half the periphery by half the diameter.—The area is also had by finding a fourth proportional to 1000,785, and the square of the diameter: or, to 452,355, and the square of the diameter.

Circles, and similar figures inscribed in them, are always as the squares of the diameters: so that they are in a duplicate ratio of their diameters; and therefore of their radii.

A *Circle* is equal to a triangle whose base is equal to the periphery, and its altitude to the radius. *Circles*, therefore, are in a ratio compounded of the peripheries and the radii.

To find the proportion of the diameter of a *CIRCLE* to its periphery.—Find, by continual bisection, the sides of the inscribed polygons, till you arrive at a side subtending any arch, howsoever small: this found, find likewise the side of a similar circumscribed polygon; multiply each by the number of sides of the polygon; by which you will have the perimeter of each polygon. The ratio of the diameter to the periphery of the circle, will be greater than that of the same diameter to the perimeter of the circumscribed polygon; but less than that of the inscribed polygon.

The difference of the two being known, the ratio of the diameter to the periphery, is easily had in numbers very nearly true; though not justly so.

Thus, Welfius finds it as 100000000000000 to 3141592-653897932. Archimedes fixed the proportion as 7 to 22. Ludolphus a Ceulen carries it to a much greater accuracy; finding, that putting the diameter for 1, the periphery is greater than 3.14159: 5358979323846264338387950; but, less than the same, number with the last cypher changed into an unite.

Metius gives us the following proportion, which is the best that is expressed by small numbers: if the diameter be 113, the periphery (113.31415): 10000; that is, 355, nearly.

To circumscribe a *CIRCLE* about a given regular polygon: bisect two of the angles of the polygon E and D, (Tab. Geometry, fig. 28.) by the lines EF and DF; and on the point of concurrence F, as on a center, with the radius EF, describe a *Circle*. See CIRCUMSCRIBING.

To inscribe any given regular polygon in a *CIRCLE*: divide 360 by the number of sides, to find the quantity of the angle EFD; which being made, in the center apply the chord ED to the periphery, as often as it will go: thus is the figure inscribed in the *Circle*.

Through three given points, not in a right line, A, B, C, fig. 7. to describe a *CIRCLE*. On A and C strike arches intersecting in D and E; and others, G and H; from C and B draw the right lines DE and HG: the point of intersection, I, is the center of the *Circle*. Hence, if, by assuming three points in the periphery, or the arch of any *Circle*, the center may be found, and the given arch be perfected.

zdy, If three points of any periphery agree, or coincide with three points of another; the whole peripheries agree, and the *Circles* are equal.

gdy, Every triangle may be inscribed in a *Circle*.

In optics, it is shewn, that a *Circle* never appears truly such, unless either the eye be directed perpendicularly to its center; or the distance of the eye from the center, when directed obliquely, be equal to the semidiameter of the *Circle*: in every other case, the *Circle* appears oblong; and to make a *Circle* that shall appear such, it must be oblong.

Parallel, or concentric *CIRCLES*, are such as are equally distant from each other in every point of their peripheries; or are described from the same center: as, on the contrary, those struck from different centers, are said to be *eccentric*.

The Quadrature of the *CIRCLE*, or the manner of making a square, whose surface is perfectly and geometrically equal to that of a *Circle*, is a problem that has employed the geometers of all ages. See QUADRATURE.

Many maintain it to be impossible; Des Cartes, in particular, insists on it, that a right line, and a *Circle*, being of different natures, there can be no strict proportion between them: and, in effect, we are likewise at a loss for the just proportion between the diameter and circumference of a *Circle*.

Archimedes is the person who has come the nearest to the quadrature of the *Circle*: all the rest have made paralogisms.—Charles V. offered a reward of 100000 crowns to the person who should solve this celebrated problem; and the states of Holland have also proposed a reward for the same.

Circles of the higher kinds, are curves wherein $AP^m : PM^m :: PM^m : PB^m$. Or, $AP^m : PM^m :: PM^m : PB^m$. Tab. Analysis, fig. 8. Cor. I. Suppose $AP = x$, $PM = y$, $AB = a$: then will $PB = a - x$. And consequently $x^m : y^m :: y^m : (a - x)^m$. Hence we have an equation that defines infinite *Circles*, viz. $ym + 1 = ax^m - x^{m+1}$; and another defining infinite other *Circles*, viz. $ym + n = (a - x)^n$.

Cor. II. If $m = 1$, then will $y = ax - x^2$; and therefore a *Circle* of the first order is contained under this equation alone. If $m = 2$, $y^2 = ax^2 - x^3$, which equation defines a *Circle* of

the second order.

CIRCLES of the Sphere, are such as cut the mundane sphere, and have their periphery either on its moveable surface, or in another immoveable, conterminous, and equidistant surface.

Hence arise two kinds of *Circles*, moveable, and immoveable.

The first, are those whose peripheries are in the moveable surface, and which therefore revolve with its diurnal motion; as, the meridians, &c.

The latter, having their periphery in the immoveable surface, do not revolve; as the *ecliptic*, *equator*, and its *parallels*, &c.

If a sphere be cut in any manner, the plane of the section will be a *Circle*, whose center is in the diameter of the sphere.

Hence the diameter of a *Circle* passing through the center, being equal to that of the *Circle* which generated the sphere; and that of a *Circle* which does not pass through the center, being only equal to some chord of the generating *Circle*; the diameter being the greatest of all chords, there hence arises another division of the *Circles* of the sphere, viz. into great and lesser.

Great *CIRCLE* of the Sphere, is that which divides it into two equal parts, or hemispheres; having its center in the center thereof.

Hence, all great circles are equal, and cut each other into equal portions, or semicircles.

The great *Circles* are the horizon, meridian, equator, ecliptic, the colures, and the azimuths; which see in their places.

Lesser *CIRCLE* of a Sphere, is that which divides the sphere into two unequal parts, and has its center in the axis of the sphere, but not in the center thereof.

These are usually denominated from the great *Circles* they are parallel to; as, *parallels* of the equator, &c.

CIRCLES of Altitude, otherwise called *altimontars*, are *Circles* parallel to the horizon, having their common pole in the zenith, and still diminishing as they approach the zenith.

They have their names from their use; which is to shew the altitude of a star above the horizon.

CIRCLES of Declination, are great *Circles* intersecting each other in the poles of the world.

Diurnal *CIRCLES*, are immoveable *Circles*, supposed to be described by the several stars, and other points of the heavens, in their diurnal rotation round the earth; or rather, in the rotation of the earth round its axis.

The Diurnal *Circles* are all unequal: the equator is the greatest.

CIRCLE Equant, in the Ptolemaick astronomy, is a *Circle* described on the center of the equant.

Its chief use is, to find the variation of the first inequality.

CIRCLES of Excursion, are *Circles* parallel to the ecliptic, and at such a distance from it, as that the excursions of the planets towards the poles of the ecliptic, may be included within them; usually fixed at 10 degrees.

It may be here added, that all the *Circles* of the sphere above described, are transferred from the heavens to the earth; and thence come to have a place in geography, as well as in astronomy: all the points of each *Circle* being conceived to be let fall perpendicularly on the surface of the terrestrial globe, and so to trace out *Circles* perfectly similar to them.

Thus, the terrestrial equator is a line, conceived precisely under the equinoctial line, which is in the heavens; and so of the rest.

Horary *CIRCLES*, in dialling, are the lines which shew the hours on dials; though these be not drawn circular, but nearly so.

CIRCLES of Latitude, or *Secondaries* of the Ecliptic, are great *Circles* parallel to the plane of the ecliptic, passing through the poles thereof, and through every star and planet.

They are so called, because they serve to measure the latitude of the stars, which is nothing but an arch of one of these *Circles*, intercepted between the star and the ecliptic.

CIRCLES of Longitude, are several lesser *Circles*, parallel to the ecliptic; still diminishing, in proportion as they recede from it.

On the arches of these *Circles*, the longitude of the stars is reckoned.

CIRCLE of perpetual Apparition, one of the lesser *Circles*, parallel to the equator; described by any point of the sphere touching the northern point of the horizon; and carried about with the diurnal motion.

All the stars included within this *Circle* never set, but are ever visible above the horizon.

CIRCLE of perpetual Occultation, is another *Circle* at a like distance from the equator; and contains all those stars which never appear in our hemisphere.

The stars situate between these *Circles*, alternately rise and set at certain times.

Polar *CIRCLES*, are immoveable *Circles*, parallel to the equator, and at a distance from the poles equal to the greatest declination of the ecliptic.

That next the northern pole is called the *arctic*; and that next the southern one the *antarctic*.

CIRCLES of *Position*, are *Circles* passing through the common intersections of the horizon and meridian, and through any degree of the ecliptic, or the center of any star, or other point in the heavens; used for finding out the situation or position of any star.

They are usually made six in number; and cut the equator into twelve equal parts, which the astrologers call the *celestial houses*. Hence some call them *circles of the celestial houses*.

Antarctic Circle. See the article ANTARCTIC.

Arch of a Circle. See the article ARCH.

Arctic Circle. See the article ARCTIC.

Axis of a Circle. See the article AXIS.

Center of a Circle. See the article CENTER.

Eccentric Circle. See the article ECCENTRIC.

Equal Circle. See the article EQUAL.

Fairy Circle. See the article FAIRY.

Right Circle. See the article RIGHT.

Secondary Circles. See the article SECONDARY.

Segment of a Circle. See the article SEGMENT.

Vertical Circles, or azimuths. See VERTICAL, and AZIMUTH.

CIRCLE, CIRCULUS, is understood among the schoolmen, of a vicissitude of generations, arising one out of another.

Thus, good concoction causes a good habit of body; a good habit of body produces strength and vigour; these occasion frequent exercises; and these a good concoction.

It is a celebrated dogma of the Scotists, 'There is no *Circle* in 'causes of the same order, or kind.'

CIRCLE, in logic, that fault of an argument that supposes the principle it should prove, and afterwards proves the principle by the thing it seemed to have proved.

Or, a *Circle* in logic, called also *sylogistic Circle*, is when the same terms are proved, *in orbem*, by the same terms; and the parts of the syllogism, alternately by each other, both directly and indirectly.

There are two kinds of *Circles*; the one *material*, the other *formal*.

The *formal* is that which in two reciprocal syllogisms begs the medium, which is the next cause of the greater extreme. This kind is by no means to be admitted: otherwise, the same thing becomes both prior and posterior; the cause and effect of itself; which is absurd.

The *material Circle*, called also *regressus*, consists of two syllogisms, the former whereof proves the cause by the effect; and the latter the effect by the cause: this may be admitted.

CIRCLES of the Empire, are such provinces, and principalities of the empire, as have a right to be present at diets.

The division of the empire into six *Circles*, was established by Maximilian I. in 1500, at Augsburg: twelve years afterwards he divided it afresh, into ten *Circles*; which partition was confirmed by Charles V. at the diet of Nuremberg, in 1522.

Though the order of these *Circles* has never been well regulated; yet, in the imperial matricula, it is as follows: the *Circle* of Austria, that of Burgundy, of the Lower Rhine, of Bavaria, Upper Saxony, Franconia, Suabia, Upper Rhine, Westphalia, and the Lower Saxony. See DIET.

CIRCUIT, or CIRCUIVITY, in law; a longer course of proceeding to recover the thing sued for, than is needful.

Thus, if a man grant a rent-charge of 10 *l.* out of his manor, and after, the grantee disleizeth the grantor of the same manor, who brings an assize, and recovers the land, and 20 *l.* damages; which being paid, the grantee brings his action for 10 *l.* of his rent, due during the time of the disleizin, and which he must have had, if no disleizin had been: this is called *Circuit of Action*; because, whereas the grantor was to receive 20 *l.* damages, and to pay 10 *l.* rent, he might have received but 10 *l.* for damages, and the grantee have kept the other.

CIRCUIT, is also the journey, or progress the judges take, twice every year, through the several counties of England and Wales, to hold courts, and administer justice, where recourse cannot so well be had to the king's courts at Westminster. See JUDGE, and ASSIZE.

England is divided into six *circuits*; viz. the Home-circuit, Norfolk Circuit, Midland Circuit, Oxford Circuit, Western Circuit, and Northern Circuit.

CIRCUITORES. See AGONISTICI.

CIRCULAR, any thing that is described, or moved in a round; as the circumference of a circle, or the surface of a globe. See CIRCLE.

The *circular* form is of all others the best disposed for motion; and the most capacious.

The modern astronomers shew, that the heavenly bodies do not move in *circular*, but in elliptic orbits. See ORBIT, PLANET, &c.

CIRCULAR Arches. See the article ARCH.

CIRCULAR Letter, a letter directed to several persons, who have the same interest in some common affair; as, in the convocation of assemblies, &c.

CIRCULAR Lines, an appellation given by some to such straight lines as are divided from the divisions made in the arch of a circle.—Such are sines, tangents, secants, &c. See SINE, and TANGENT.

CIRCULAR Numbers, are such whose powers end in the roots themselves; whose square is 25, and cube 125. See NUMBER.

CIRCULAR Sailing, is that performed in the arch of a great circle.

Circular sailing, of all others, goes the nearest or shortest way; and yet there are such advantages in sailing by rhumbs, that this latter is generally preferred. See SAILING.

CIRCULAR winding Stairs. See the article STAIRS.

Resistance of a Circular Segment. See RESISTANCE.

CIRCULAR Velocity, a term in astronomy, signifying that velocity of a planet, or revolving body, which is measured by the arch of a circle: as suppose by A *b*, (Tab. *Astronomy*, fig. 10.) described on the center of attraction S.

The *Circular velocity* of a body moving from B to C, is measured by the arch B C.

CIRCULATION, the act of moving round, or in a *Circle*.

We say, the *Circulation* of the blood; the *Circulation* of the sap; of the spirits, &c.

As in the great world we find a perpetual and orderly *Circulation* of waters, conveyed from the sea by subterraneous passages, springs, &c. and returned thither again by rivers, &c. so in the little world, man, a like circuit is observed; the blood being continually driven from the heart, by the arteries, to all parts of the body; and brought back again to the heart by the veins.

CIRCULATION of the blood, denotes a natural motion of the blood in every living animal; whereby that humour is alternately conveyed from the heart to all the parts of the body, by the arteries, and returned from the same parts to the heart by the veins.

The heart, we have elsewhere shewn, is a muscle, into the ventricles or cavities whereof, all the veins discharge themselves, and from which all the arteries arise; having withal, a reciprocal action of dilatation, or diastole; and contraction, or systole. Now, the necessary effect of such alternate action, is, that the heart, by turns, both receives and expels the blood. The blood expelled out of the right ventricle, must be carried through the pulmonary artery (which arises thence) into the lungs; from which it must be returned, by the pulmonary vein, to the left ventricle, (in which that vein terminates.) From the left ventricle, the blood thus imported, is by the contraction of that part, again expelled into the aorta, and by it distributed all over the rest of the body; and thence is returned again to the right ventricle by the cava, which compleats the *Circulation*.

The *Circulation* of the blood, has been generally allowed to have been first discovered in England, in the year 1628, by Harvey, a physician of our own country; though there are several authors who dispute it with him.

Janston ab Almeloveen, in a treatise of *new inventimi*, printed in 1684, quotes several passages from Hippocrates, to prove that the *Circulation* was known to him. Walkeus, *ep. ad Barthol.* pretends, it was known not only to Hippocrates, but also to Plato and Aristotle.—It is added, that the Chinese physicians taught it 400 years, before it was spoke of in Europe.

Some go back as far as Solomon, and imagine they see some traces of it in Ecclesiastes, chap. xii.—Bern. Genga, in an Italian treatise of anatomy, quotes several passages from Realdus Columbus, and And. Cæsalpinus, whereby he endeavours to prove that they admitted a *Circulation*, long enough before Harvey.

He adds, that Fra. Paolo Sarpi, the famous Venetian, from a consideration of the structure of the valves of the veins, and other experiments, concluded a *Circulation*.

Leonicens adds, that F. Paolo durst not make known his discovery, for fear of the inquisition; that he therefore only communicated the secret to Fab. ab Aquapendente; who, after his death, deposited the book he had composed on it in the library of S. Mark; where it lay hid a long time, till Aquapendente discovered the secret to Harvey, who then studied under him at Padua; and who, upon his return to England, a country of liberty, published it as his own.—But much of this is fable. Sir Geo. Ent has shewn that Father Paul received the first notice of the circulation of the blood from Harvey's book on the subject, which was carried to Venice by the ambassador of the republic at the court of England, who shewed it to F. Paul, by whom some extracts were made from it, which coming afterwards into the hands of his heirs, gave rise to an opinion in several persons that he was the author of the papers and the invention. See Douglas's Biblioth. Anat. Spec. p. 227. Edit. 1734.

The *Circulation* of the blood is evinced, from the following considerations.—1. All the blood of a living animal, upon wounding any one of the larger arteries, is, in a little time, evacuated; and that with a considerable force: as appears from the operations of butchers, &c.

Hence, it follows, that the blood has a passage from every part of the animal body into every artery; and if the whole mass of blood be found to move on this occasion, it is evident it must have moved before.

2. The great quantity of blood driven out of the heart into the arteries at every pulse, makes a *Circulation* necessary; since, without it, an infinitely greater stock of blood must be supposed

in the body of a man, than any observation, or experiment will allow of.

For though the antients, who knew not this *Circulation*, imagined that only a drop or two was expelled at each systole; which they were necessitated to suppose, to avoid the too great distension of the arteries, from a more considerable influx: yet it is certain, and even demonstrable, that there must needs be an ounce, or more, driven into them at each time; and yet some compute that there are five or six thousand pulsations in an hour.

3. Any of the arteries, being tied with a thread, swell, and beat, between the bandage and the heart; but they grow flaccid between the bandage and the extremities of the body. If now the artery be cut between the bandage and the heart, blood streams out, even to death: if it be cut between the bandage and the extremities of the body, the quantity of blood it yields is very small.

The vital blood, therefore, flows through the arteries; and its course is from the heart towards the extremes of the body: and this it does in every point of the body, internal and external; fill out of a wider part into a narrower; out of the trunk into the branches. And it is on this principle alone, that all the blood may be derived into any artery, and evacuated at it.

4. Any one of the larger veins being bound up with a thread, swells between the extremes of the body and the bandage; but without beating: and between the bandage and the heart it becomes flaccid.

If opened in the former part, it bleeds largely; if in the latter, it scarce bleeds at all. The blood, therefore, flows briskly from every part of the body into this vein; and its course is from the extremes of the body towards the heart; from the narrower parts of the vein towards the wider parts; from the branches to the trunk.

From the whole, it is evident, that all the arteries of the body are continually bringing the blood from the left part of the heart, through the trunks of the arteries, into the branches; and from those to all parts of the body, internal and external: and on the contrary, that all the veins, excepting the porta, are perpetually bringing back the blood from the extreme parts into the smaller branches; from those it passes into the larger, at length into the trunks, and thence into the cava; and thro' the sinus venosus, or trunk of that vein (which ends in the cavity of the right auricle) into the heart.

The blood being arrived here, its motion, or *Circulation*, is continued as follows.

The auricles of the heart being large hollow muscles, furnished with a double series of strong fibres proceeding with a contrary direction to two opposite tendons, the one adhering to the right ventricle, the other to the sinus venosus; as also with innumerable veins and arteries; by the contractile force of these auricles, the blood will be vigorously expressed, and drove into the right ventricle; which, upon this contraction, is rendered flaccid, empty, and disposed to admit it.

If now the right ventricle, thus full of blood, by the contraction of its fibres press the blood towards the aperture again; the venous blood at the same time pouring in, will drive it back again into the cavity, and mix it more intimately; till rising up against the parietes, it raise the valvule tricuspidales, which are so connected to the fleshy columns extended on the opposite side, as that when laid quite down they cannot close the parietes of the right ventricle: these it thrusts towards the right auricle, till being there joined, they stop the passage very closely, and prevent any return.

By the same means, the same blood rises up into the three femilunar valves, placed in the extremity of the other mouth, and lying open to the pulmonary artery: these it shuts close against the sides of the artery, and leaves a passage into the artery alone. The venous blood therefore, that is, the blood of the whole body continually moves out of the sinus, or trunk of the vena cava, through the right auricle, and right ventricle, into the pulmonary artery, and that in a continued and forcible stream.

The blood carried by this artery into the lungs, and distributed by its branches through the whole substance thereof, is first admitted into the extremities of the pulmonary vein, called *arteria venosa*; whence passing into four large vessels, which unite together, it is brought to the left sinus venosus, or trunk of the pulmonary vein; by the force of whose muscular structure it is driven into the left ventricle, which, on this occasion, is relaxed, and by that means prepared to receive it.

Hence, as before, it is driven into the left ventricle, which is relaxed by the same means; and the valvule mitrales opening, admit it into the left ventricle, and hinder its reflux into the pulmonary vein.

From hence it is forced into the aorta; at whose orifice there are three femilunar valves, which also prevent a reflux by closing the same.

And thus is *Circulation* effected; all the blood sent into the lungs, and received into the arteria venosa, sinus venosus, left auricle and ventricle, being here continually propelled into the aorta; whose ramifications are spread throughout all the rest of the body, with a violent motion.

This motion, in living animals, is attended with the following phenomena.

1. Both the venous sinus's are filled, and grow turgid at the

same time. 2. Both auricles grow flaccid at the same time; and both are filled at the same time, with blood impelled by the contractile force of its correspondent muscular venous sinus.

3. Each ventricle contracts, and empties itself of blood at the same time; and the two great arteries are filled and dilated at the same time. 4. As soon as the blood, by this contraction, is expelled, both ventricles being empty, the heart grows longer and broader; and consequently more flaccid and capacious.

5. Upon which, the muscular fibres of both venous sinus's contract, and express the blood contained in them into the ventricles of the heart. 6. In the mean time, the venous sinus's are again filled, as before; and the auricles, &c. return into their former habitude.

7. And this alternation continues till the animal begins to languish, under the approach of death; at which time the auricles and venous sinus's make several palpitations, for one contraction of the ventricle.

Thus is all the blood, in its return from every point of the body, internal and external, and from every point of the heart and its auricles, impelled into the right ventricle; out of that into the lungs; thence into the left ventricle; and thence through the whole extent of the body; and thence again is brought back to the heart.

As to the manner of the blood's passing out of the arteries into the veins, in order to its being returned to the heart; there are two opinions.

In the first, the veins and arteries are supposed to open into each other, or to be continued from each other, by anastomoses, or inosculation of their extremities.

In the latter, the extreme capillary arteries are supposed to let out their blood into the pores of the substance of the parts; on whose nutrition part is spent, and the rest is received in at the mouths of the capillary veins.

Each of these manners must be allowed to have its reason: For without the first, it were difficult to account for so quick a return of the blood to the heart, as in effect we find; besides, that in some of the larger vessels, there is a confessed anastomosis, *v. g.* in the splenic artery with the plemic vein, &c. whence authors conclude the same contrivance to hold in the lesser vessels; even in the smallest twigs in the extreme parts of the body, though not discovered by the eye; nature being ordinarily found very uniform, and consistent with herself.

Riolanus, however, who will allow of no *Circulation* but by anastomoses; allows of none, neither, but by the larger vessels.

The reason of the latter opinion is deduced hence, that if part of the arterial blood did not ooze out into the substance of the parts, they could not be nourished thereby: for the blood, while contained in the vessels, may indeed convey warmth thereto, but no nutriment; the very vessels themselves being not nourished by the fluid running in their cavity, but by capillaries passing their coats.

If then the blood be driven out of the vessels in a greater quantity than is required for nutrition; the redundancy must be imbibed by the capillary veins.

M. Leewenhoeck seemed to have put this matter out of doubt by his microscopes, with which he discovered the inosculations, or continuations of the extremities of the veins and arteries in fishes, frogs, &c. But some still doubt whether there be such continuations in the extremes of the veins and arteries in human bodies and quadrupeds: those animals it has been hitherto observed in, being either fish, or some of the amphibious kind, which have but one ventricle in the heart, and their blood actually cold: to which it may be added, that the blood in these creatures does not circulate with that rapidity as in those whose hearts have two ventricles.

This difference in the principal organs of *Circulation*, occasioned Mr. Cowper to make experiments on other animals, whose parts have the same structure with those of man. In the omentum of a cat, he saw the blood move briskly through the inosculations; the same also he found of the omentum, and much clearer in the mesentery, of a dog. He adds, that the extremity of the vessels are not equally lessened, in the inosculations, in different animals.

In the tail of the tadpole, he frequently observed several communications between the veins and the arteries; through each of which two globules of blood might pass abreast. In young fish, particularly grigs, the communicant branch is so small, that one globule of blood can scarce pass in the space of three seconds.

In a foetus, the apparatus for the *Circulation* is somewhat different from that above described.—The septum, which separates the two auricles of the heart, is pierced through with an aperture, called the *foramen ovale*; and the trunk of the pulmonary artery, a little after it has left the heart, tends out a tube in the descending aorta, called the *communicating canal*.

The foetus being born, the *foramen ovale* closes, by degrees, and the canal of communication dries up, and becomes a simple ligament.

This mechanism once known, it was easy to perceive its use.—For while the foetus is inclosed in the uterus, it receives no air, but that little furnished it by the umbilical vein: its lungs, therefore, cannot swell and subside as they do after the birth, and after the free admission of the air. They continue almost at rest,

and without any motion; their vessels are as it were full of themselves, and do not allow the blood to circulate, either in abundance, or with ease.

Nature, therefore, has excused the lungs from the passage of the greatest part of the blood; and has contrived the foramen ovale, by which part of the blood of the vena cava, received into the right auricle, passes into the left auricle, as the mouth of the pulmonary veins; and by this means is found as far in its journey as if it had passed the lungs.

But this is not all, for the blood of the cava, which, missing the foramen ovale, passes from the right auricle into the right ventricle; being still in too great quantity to pass by the lungs, whither it is driven through the pulmonary artery; the communicant canal intercepts part of it in the way, and pours it immediately into the descending aorta.

This is the doctrine of Harvey, Lower, and most other anatomists; but M. Mery, of the royal academy, has made an innovation in it.

He assigns another use for the foramen ovale; and maintains, that the whole mass of blood brought from the cava to the right ventricle, passes, as in adults, into the pulmonary artery, whence part of it is conveyed by the communicant canal into the aorta; and the rest brought from the lungs by the pulmonary vein into the left auricle, where it is divided into two parts; the one passing through the foramen ovale into the right ventricle, without circulating through the aorta, and the rest of the body; the other part pulsed, as in adults, by the contraction of the left ventricle, into the aorta, and the whole body of the fœtus.

The whole question then turns upon this, *viz.* whether the blood pass through the foramen ovale from the right to the left ventricle, or from the left to the right?

M. du Verney asserts the antient opinion, against M. Mery, and maintains that the foramen ovale, has a valve so disposed as to be opened by the blood driving into the right ventricle, but shut the more firmly by its pushing towards the left. But M. Mery denies the existence of any such valve.

Again, in an adult, the aorta being to receive all the blood of the pulmonary artery, is found of the same bigness. In a fœtus, the two arteries are to receive unequal quantities, which of the two systems never be followed.

According to the common opinion, the aorta receiving more blood than the pulmonary, should be bigger: according to the opinion of M. Mery, the pulmonary artery should be the bigger, as being esteemed to receive a greater quantity of blood.

To judge of the two systems therefore; it should seem there needed nothing but to determine which of the two vessels were biggest in a fœtus.

M. Mery always found the pulmonary artery half as big again as the aorta; and, on the other hand, Mr. Tauvry, who seconded M. du Verney, produces cases where the pulmonary is less than the aorta: the facts on both sides being examined by the French royal academy.

M. Tauvry adds, that though the pulmonary artery should be greater than the aorta, yet this does not prove that more blood passes the first than the second; since it may be accounted for from the blood's pressing more slowly towards the lungs, which it finds some difficulty to penetrate, and accordingly swells, and is driven back.

M. Littré, upon dissecting an adult, in whom the foramen ovale was still open, and measuring the capacities of the vessels on each side, declares for M. Mery.

For the source of the *Circulation* in the fœtus, anatomists are again divided.—The popular opinion is, that during gestation, the arteries of the uterus convey their blood into the placenta, which is nourished by it, and the surplus conveyed into the roots of the umbilical vein, which makes part of the navel-string: thence it is carried to the liver of the fœtus, where it enters the vena cava, and is thence conveyed to the right ventricle of the heart, and distributed as before.

Again, the blood brought from the iliac arteries of the fœtus, enters the navel-string by the umbilical arteries; then passes into the placenta, where it is resumed by the veins of the uterus, which carry it back again to the mother; and perhaps also by the roots of the umbilical vein, which mix it afresh with the blood of the mother.

According to this system therefore, it is the blood of the mother that supplies the child; which is here only regarded as a distinct member, or part of her frame.

The beating of her heart sends it a portion of her blood; and so much of the impulse is preserved, as suffices to maintain that languid *Circulation* which a fœtus enjoys; and, in all probability, gives that feeble pulsation observed in the heart.

Other anatomists maintain, that the fœtus is only supplied with chyle from the glands of the uterus; which is further elaborated, and turned into blood in the vessels of the fœtus; and circulates therein, without any further communication with the mother.—These allow of no reciprocal *Circulation*, excepting between the placenta and the fœtus.

But the former opinion seems best supported: For the placenta being separated from the uterus, during the time of gestation, neither yields any chyle, nor any other thing but blood. Besides,

M. Mery has shewn, that the uterus has no glands to furnish any chyle.

Two other observations of the same author, confirm the popular system: the inner surface of the uterus is lined with veins; and the outer surface of the placenta is not lined with any membrane. Now as it is by these two surfaces that the two fœtus in some measure glued together; it looks as if they were only left without membranes, for an immediate communication between their blood-vessels.

Add to these a fact whereof M. Mery was an eye-witness: a woman big with child was killed by a fall; in the cavity of her belly were found seven or eight pints of blood; all the blood-vessels being emptied: the child too was found dead; but without the least appearance of any wound or contusion: all its blood-vessels being empty of blood, like those of the mother.

The body of the placenta still adhered to the whole inner surface of the uterus; nor was there any extravasated blood there.

Now the blood here had no other way to discharge itself, but by the veins of the uterus: whence it follows, that those veins bring back to the mother the blood of the fœtus; which alone establishes the whole system. If the *Circulation* were only from the fœtus to the placenta, and not also to the mother; the dead child would have had all its blood.

Upon the whole, the blood in the lungs of the fœtus has none of the advantages of air or respiration; which yet being necessary, nature, it is supposed, takes care that it receives a portion of air, mixed together with its mother's blood, and transmitted to it by the umbilical vessels, to be diffused through the body.

This is confirmed hence, that by constricting the navel-string very tight, the child dies like a man strangled: which appears to be owing to nothing but the want of air. Add to this, that as soon as the mother ceases to respire, the fœtus expires.

As to the velocity of the circulating blood, and the time wherein a *Circulation* is completed; several computations have been made.—By Dr. Keil's account, the blood is driven out of the heart into the aorta, with a velocity which would carry it 52 feet in a minute. But this velocity is continually abated in the progress of the blood through the numerous sections, or branches of the arteries: so that before it arrive at the extremities of the body, its motion is infinitely diminished.

The same author, upon a moderate ratio of the branches of the arteries to the trunks, shews, that the greatest velocity of the blood is to the least, in a greater proportion than of 10000,00000,00000,00000,00000,00000,00000, to 1.

The space of time wherein the whole mass of blood may ordinarily circulate, is variously determined.—Some of the latest writers state it thus: supposing the heart to make 2000 pulses in an hour, and that at every pulse there is expelled an ounce of blood; as the whole mass is not ordinarily computed to exceed 24 pounds, it must be circulated seven or eight times over in the space of an hour.

CIRCULATION of the spirits, or nervous juice. That the spirits circulate, is evinced in the same manner as some authors chuse to prove the *Circulation* of the blood, *viz.* That as the heart drives out every hour three or four thousand ounces of blood, whereas, ordinarily, there is not above two thousand in the whole body; there is a necessity for the blood driven out, to return to the heart, in order to supply a fund to be expelled.

In like manner it is shewn, that there is formed each hour a large quantity of spirits, which are nothing but the more subtil parts of this blood driven out from the heart; whence it is inferred, that these two must circulate.

The course they are supposed to take, is this.—The most subtil parts of the arterial blood being carried from the heart to the brain by the carotid arteries, are thrown violently into the fine net-work wherewith the bottom of the ventricles of the brain is lined; whence the more delicate parts are driven into the mouths of the choroid arteries, where they continue their rapid motion, and discharge themselves at the pores where those vessels terminate around the pineal gland.

Hence they enter that gland, and there form a constant spring of spirits; which being here purified, enter the cavities of the brain, and insinuating into the pores of its substance, flow into the lymphatics; whence they are carried to the heart by two ways. Those from the upper parts by the subclavian veins, and the adjacent vessels: those from the lower, being discharged into Pecquet's reservoir, proceed by the thoracic duct, and at last by the descending veins to the heart. Whence they begin their course afresh.

CIRCULATION of the Sap, is a natural motion of the nutritious juice of plants, from the root to the extreme parts, and thence back again to the root.

The experiments of modern naturalists, and gardeners, seem to prove a *Circulation* in the body of plants, by veins and arteries, analogous to that in animals.

M. Perrault started the *Circulation* of the sap in France, and proposed it, in 1667, to the royal academy: though M. Major, a physician of Hambourg, had published it unknown to M. Perrault, two years before. A year and half afterwards, M. Mariotte proposed the same to the academy, as

a new

a new thing; not knowing that M. Perrault had been beforehand with him: and the great Malpighi appears to have entertained the same thought about the same time.

The opinion, however, was not universally received: some of the ablest botanists, and particularly M. Dodart, protesting openly against it.

That author allows of a juice mounting from the root to the extremities of the branches; and of another descending from those extremities to the root: the first imbibed from the soil, and digested in the root, for the nourishment of the plant: the second received from the moist parts of the air, in at the extremities of the branches. The rising and descending juices, therefore, according to him, are not the same; or, that which rises, never descends, and reciprocally; i. e. there is no *Circulation*.

Dr. Tong, in the *Philosophical Transactions*, maintains, that the sap always rises, and never properly descends; having only a subsiding, or recidivation, which he can by no means call a *Circulation*.

M. Switzer owns himself at a loss for the method wherein a *Circulation* should be effected; as well as for the parity of reason commonly urged for a *Circulation* of the sap, and of the blood. In animals, he observes, the degree of growth, or extension, is but very small: so that the blood, not being employed in any other service, may be easily supposed to circulate: but trees, growing to an unlimited tallness, it is probable the great effort of nature is employed in extending them that way; and that the nutritious juice only ascends. He adds, that as to the swelling or extension of trees in bulk, it evidently arises from the effusion of the sap from the heart of the tree through the pores, which dilates the whole insensibly, by accumulating circle on circle; which are annual gradations easily observed upon cutting a branch, or trunk across.

But still, the arguments for a *Circulation* seem of more weight than any thing here urged against it.—The same experiments of ligature, and incision, which evince a *Circulation* in animals, have been made in plants; particularly in such as abound in sap, as the spurge, &c. and with the same success; the part between the ligature and the root swelling very considerably, and the other much less.

The ligatures are to be made with metalline rings. Dr. Lifter gives us an instance in the cataputia minor, where the ligature being only a silken thread, tied as hard as possible without breaking the skin, no greater swelling arose on one side the ligature than on the other.

Mr. Lawrence gives us a demonstration of the *Circulation* of the sap, from an experiment on the yellow striped jessamine.—Upon a branch of a plain jessamine, whose stem spreads itself in two or three branches, inoculate a bud of the yellow striped jessamine, in autumn: as the tree comes to shoot, the following summer, some of the leaves will be found tinged here and there with yellow; and this even on the branches not inoculated; till, by degrees, the whole tree, even the very wood of the young branches, will be all variegated, or striped with green and yellow.

Mr. Fairchild confirms this experiment by a similar one of his own: Having inoculated a yellow spotted jessamine tree, into another jessamine tree; he found, that though the bough did not take, yet, in a fortnight's time, yellow spots began to appear on a shoot which came out of the ground from another part of the plant.

As to the manner of the *Circulation*; it is not difficult to conceive. Malpighi, Grew, &c. by means of microscopes, have discovered, that the wood of plants consists of fine capillary tubes, which run parallel from the root, through the trunk, and may be looked on as arteries; and on the outside of these, betwixt the wood and the inner bark, are other large tubes, to do the office of veins.

Now, the root having imbibed a stock of juice from the earth, that juice will be put in motion by the heat; that is, it will be rarefied, and made to ascend in form of a steam or vapour. Meeting, therefore, with the open mouths of the arterial vessels, it will pass through the same to the top and extreme parts of the tree, with a force answerable to the heat by which it is put in motion: when it is there arrived, meeting with the cold of the external air, it is condensed into a liquor; and in that form returns, by its own weight, towards the root of the renal vessels abovementioned.

CIRCULATION, in chymistry, is an operation whereby the same vapour, raised by fire, falls back; to be returned and distilled several times, and thus reduced into its most subtil parts.

Circulation is performed by disposing the liquor in a single vessel, stopped at top, called a *pelican*; or in a double vessel, consisting of two pieces, luted on each other; the lower to contain the liquor and its vapours.

It is performed either by the heat of a lamp, or that of ashes, or of sand moderately hot, or in dung, or by the sun. It usually demands a continued heat of several days, sometimes of several weeks, or even several months.—By *Circulation*, the finest part of the fluid mounts to the top of the vessel; and finding no issue there, falls back again, and rejoins the matter left behind at the bottom, whence it arose: and thus, by continu-

ing to rise, and fall alternately in the vessel, there is effected a kind of *Circulation*, or remixture of the spirituous parts with the gross ones; whereby the former are rendered finer, and more subtil, and are better disposed to exert their activity when separated from the latter.

CIRCULATORY, **CIRCULATORIUM**, in chymistry, the vessel wherein a fluid is put, to undergo the process of *Circulation*. See **CIRCULATION**.

There are two kinds of *Circulatories*, the *dieta*, or double vessel; and the *pelican*. See **DOUBLE VESSEL**, and **PELICAN**.

CIRCULUS, in geometry, logic, &c. See **CIRCLE**.

CIRCULUS, among chymists, is a round iron instrument, used in cutting off the necks of glass vessels: which they effect thus.

The instrument being heated, is applied to the glass vessel, and there kept till the latter grow hot: then, by a few drops of cold water, or a cold blast thereon, it flies evenly and regularly off.—Thus they cut off the necks of retorts, or cucurbits.

There is another method of doing the same, viz. by tying a thread, first dipped in oil of turpentine, round the place where the section is to be; and then setting fire to the thread.

This done, some cold water being sprinkled on the place, the glass will be cracked through precisely where the thread was tied.

CIRCUMAGENTES *Mysuli*, in anatomy. See **OBLIQU**.

CIRCUMAMBIENT, an epithet denoting a thing to invest, or encompass another around.

We say the ambient, or *circumambient* air, &c.

CIRCUMCISION, the act of cutting off the prepuce; or, a ceremony in the Jewish and Mahometan religions, wherein they cut away the fore-skin of the males who are to profess the one, or the other law.

Circumcision commenced in the time of Abraham; and was, as it were, the seal of a covenant stipulated between God and him: It was in the year of the world 2178, that Abraham, by divine appointment, circumcised himself, and all the males of his family; from which time it became an hereditary practice among his descendants.

The ceremony, however, was not confined to the Jews: Herodotus and Philo Judeus observe, that it obtained also among the Egyptians and Ethiopians. Herodotus says, that the custom was very antient among each people; so that there was no determining which of them borrowed it from the other. The same historian relates, that the inhabitants of Colchis also used *Circumcision*; whence he concludes, that they were originally Egyptians. He adds, that the Phœnicians and Syrians were likewise circumcised; but that they borrowed the practice from the Egyptians. And lastly, that a little before the time when he wrote, *Circumcision* had passed from Colchis, to the people inhabiting near Thermoodon and Parthenius.

Marham is of opinion, that the Hebrews borrowed *Circumcision* from the Egyptians; and that God was not the first author thereof: citing Diodorus Siculus, and Herodotus, as evidences on his side. This latter proposition seems directly contrary to the testimony of Moses, who assures, Gen. xvii. that Abraham, though 99 years of age, was not circumcised till he had the express command of God for it. But as to the former position of Marham, it will admit of more debate. The arguments on both sides may be seen in one view in Spencer de Legibus Hebræor. l. 2. c. 4.

Be this as it will, it is certain, the practice of *Circumcision* among the Hebrews, differed very considerably from that of the Egyptians.—Among the first, it was a ceremony of religion, and was performed on the eighth day after the birth of the child. Among the latter, it was a point of mere decency and cleanliness; and, as some will have it, of physical necessity: and was not performed till the thirteenth year; and then on girls as well as boys.

Among the Jews, *Circumcision* was performed with a knife of stone.—They set aside the practice of *Circumcision*, during the forty years of their passage through the wilderness; in regard, *Circumcision* being intended as a mark of distinction between the Jews and the Gentiles, it was unnecessary to make any mark at all, in a place wherein there was nobody to mix with them. M. Fleury observes, that the Jews were not unanimous as to the necessity of *Circumcision*; some holding it an essential, others only as a circumstance.

The Turks, before the operation of *Circumcision*, squeeze the skin with little pinchers, to deaden the sensation: they then cut it off with a razor, and apply a certain powder, which heals the wound, and takes off the pain. They never circumcise till the seventh or eighth year; as having no notion of its being necessary to salvation.

The Persians circumcise their boys at thirteen years; and their girls from nine to fifteen.—Those of Madagascar cut off the flesh at three several times: and the most zealous of the relations present, catches hold of the preputium and swallows it.

Herrera tells us, there is a kind of *Circumcision* among the Mexicans, though they are very far both from Judaism and Mahometanism: they cut off the foreskin of the virile member and the ears, as soon as the child is born, with a word of ceremony.

Circumcision

Circumcision is also practised on women, by cutting off the foreskin of the clitoris, which bears a near resemblance, and analogy to the preputium of the male penis. Strabo says, the Egyptian women were circumcised; Belon says the same of the Coptæ; and P. Jovius and Munster of the subjects of Prester John.

Among the Jews, the father is obliged to have his son circumcised on the eighth day; it may not be sooner: but the child's weakness may allow of its being deferred longer. There is a godfather to hold the child, and a godmother to carry it from the house to the synagogue, and to present it there. He who circumcises is called in Hebrew, *Mohel*: Any person is chosen for the purpose, indifferently; provided he be but capable of the function; which, among the Jews, is a title of great merit.

The manner of the ceremony, as related by Leo de Modena, is as follows.—Two seats are prepared, in the morning, with silken cushions; the one for the godfather who holds the child, the other, as they say, for the prophet Elias, whom they suppose to assist invisibly. The person who is to circumcise, brings the necessary utensils, the razor, styptic, linen, fillet, and oil of roses; to which some add a shell full of sand to put the preputium in. A palm is sung till the godmother brings the child, attended with a crowd of women, and delivers it to the godfather; none of them entering the door. The godfather being seated, sets the child on his lap: then the circumciser taking the razor, and preparing the child for the operation, says, *Blessed be thou, O Lord, who hast enjoin'd us Circumcision*; and in so saying, cuts off the thick skin of the preputium, and with his finger nails tears off another finer skin remaining; sucking the blood two or three times as it breaks out, and spitting it out into a glass full of wine: then he lays dragons-blood on the wound, with powder of coral, and other things to staunch the blood; and lastly, a compress of oil of roses; and thus binds up the whole. This done, he takes a glass of wine, and blessing it, adds another benediction for the child, and imposes the name.

The manner of circumcising among the Turks, differs from that of the Jews: for the former, after they have cut off the skin, meddle no further; but the last, tear off the edge of the remaining skin in several places with their thumb-nails; which is the reason why the circumcised Jews are cured much sooner than the Turks.

Those among the Jews who perform the operation of *Circumcision*, are distinguished by the length of their thumb-nails.

CIRCUMCISION is also the name of a feast celebrated on the first of January, in commemoration of the *Circumcision* of our Saviour.

This day was antiently kept a fast; in opposition to the Pagan superstitions, who feasted on it in honour of the god Janus.

*CIRCUMFERENCE**, in geometry, the curve line that incloses a circle, or circular space; called also the *Periphery*. See *CIRCLE*, and *PERIPHERY*.

* The word is formed from the Latin *Circum*, about; and *fero*, I carry.

All lines drawn from the center of a circle to the *Circumference*, called *radii*, are equal.

Any part of the *Circumference* is called an *arch*; and a right line drawn from one extreme of the arch to the other, a *chord*. The *Circumference* of every circle is supposed to be divided into 360 equal parts, which are called *degrees*.

The angle at the *Circumference* is double that at the center.

Every circle is equal to a triangle, whose base is equal to the *Circumference*, and its height to the radius.

Hence, the *Circumferences* of circles are to each other as their radii.

Hence, again, since the *Circumference* of one circle is to its radius, as that of any other circle to its radius; the ratio of the *Circumference* to the radius is the same in all circles.

The ratio of the diameter of a circle to its *Circumference*, Archimedes makes as seven to twenty-two; others, who bring it nearer the truth, as 10000000000000000 to 31415926535897932. For use, the proportion of 100 to 314 in smaller circles; and of 10000 to 31415 in larger circles, is commended by Vieta, Huygens, &c. Though the justest proportion for small numbers, is that of Metius, who makes it as 113 to 355.

The diameter of a circle therefore being given, its *Circumference* is had; and that multiplied by one fourth part of the diameter, gives the area of the circle.

CIRCUMFERENTOR, an instrument used in surveying, to take angles by.

The *Circumferentor* is very simple, yet expeditious in the practice: It consists of a brass circle and an index, all of a piece.—See its figure in Tab. *Surveying*, fig. 19.

On the circle is a card, or compass, divided into 360 degrees; the meridian line whereof answers to the middle of the breadth of the index. On the limb, or circumference of the circle, is folded a brass ring; which, with another fitted with a glass, make a kind of box for the needle, which is suspended on a pivot in the center of the circle. To each extreme of the index is fitted a sight.

The whole is mounted on a staff; with a ball and socket for the convenience of its motion.

To take an angle by the *CIRCUMFERENTOR*. Suppose the angle required E K G, (Tab. *Surveying*, fig. 20.) place the instrument, *v. g.* at K, with the Flower-de-luce in the card towards you. Then direct the sights, till through them you spy E; and observe what degree is pointed at by the fourth end of the needle, which suppose 296: then turn the instrument about, the Flower-de-luce still towards you, and direct the sights to G; noting the degree at which the fourth end of the needle points, which suppose 182.

This done, subtracting the lesser number 182, from the greater 296, the remainder 114, is the number of degrees of the angle E K G.

If the remainder chance to be more than 180 degrees, it must be again subtracted from 360 degrees; the last remainder is the quantity of the angle sought.

To take the plot of a field, wood, park, &c. by the *CIRCUMFERENTOR*.—Suppose ABCDEFGK, (fig. 21.) an inclosure to be surveyed with the *Circumferentor*.

1. Placing the instrument at A, the Flower-de-luce towards you, direct the sights to B; where, suppose the fourth-end of the needle to cut 191°; and the ditch, wall, or hedge, measured with the chain, to contain 10 chains, 75 links; which enter down. See CHAIN.

2. Placing the instrument at B, direct the sights as before to C; the fourth-end of the needle, *v. g.* will cut 279°; and the line B C will contain 6 chains, 83 links, to be noted as before. Then move the instrument to C; turn the sights to D, and measure CD as before.

In the same manner, proceed to D, E, F, G, H, and lastly to K; fill noting down the degrees of every bearing, or angle, and the distances of every side.

Having thus gone round the field, you will have a table in the following form.

Stations.	Degrees.	Min.	Chains.	Links.
A	191.	00	10.	75
B	279.	00	6.	83
C	210.	30	7.	82

&c.

From this table, the field is to be plotted, or protracted; for the manner whereof, see *PLOTTING*, and *PROTRACTOR*.

Note, where security is to be consulted rather than dispatch, it may be convenient to take back-sights; *i. e.* to place the instrument so, at each station, as that looking backwards through the sights to the last station, the north-end of the needle may point to the same degree as the fourth-end did, in looking forwards from the last station to this: both which instruments are used, on occasion, as *Circumferentors*.

CIRCUMFLEX, in grammar, an accent, serving to note, or distinguish a syllable of an intermediate sound between acute and grave; and generally somewhat long.

The Greeks had three accents, the *acute*, the *grave*, and the *Circumflex*, formed thus ' ^ ` . In Latin, English, French, &c. the *Circumflex* is made thus ^.

The acute raises the voice, and the grave falls, or lowers it: the *Circumflex* is a kind of undulation, or wavering of the voice, between the two.

It is seldom used among the moderns, unless to shew the omission of a letter which made the syllable long and open; a thing much more frequent in the French than among us: thus they write *pâte*, for *paste*; *tête*, for *teste*; *filme*, for *filmus*; &c. They also use the *Circumflex* in the participles; some of their authors writing *connex*, *peux*, others *commis*, *pâ*, &c. Father Buffier is at a loss for the reason of the *Circumflex* on this occasion.

The form of the Greek *Circumflex* was antiently the same with that of ours, *viz.* ^ being a composition of the other two accents, ^ in one.—But the copists changing the form of the characters, and introducing the running-hand, changed also the form of the *Circumflex* accent; and instead of making a just angle, rounded it off, adding a dash through too much haste; and thus formed an ^, laid horizontally, which produced this figure ^, instead of this ^.

CIRCUMINCESSION, in theology, a term whereby the schoolmen use to express the existence of three divine persons in one another, in the mystery of the trinity. See *PERSON*. The school divines are not the first authors of this term; Damascenus, in the eighth century, having used the word *μεταξωπνοε*, which signifies the same thing, in his explication of that text, *I am in my father, and my father is in me.*

*CIRCUMLOCUTION**, an ambages, or tour of words, used either when a proper term is not at hand, to express a thing naturally and immediately by; or when one chuses not to do it, out of respect; or for some other reason.

* The word comes from the Latin *circumloquor*, I speak about.

CIRCUMLOCUTION, in oratory, is the avoiding of something disagreeable, or inconvenient to be expressed in direct terms; by intimating the sense thereof in a kind of paraphrase, so conceived as to soften, or break the force thereof.

Thus Cicero, unable to deny that Clodius was slain by Milo, owns it, with this *Circumlocution*, 'Milo's servants being prevented from assisting their master, who was reported to be killed by Clodius; they, in his absence, and without his privacy, or content,

‘content, did what every body would expect from their own
‘servants on such an occasion.’

CIRCUM-POLAR Stars, are such stars as being pretty near our north-pole, move round it; and in our latitude, never set, or go below the horizon.

CIRCUMSCRIBING, in geometry, denotes the describing a polygonous figure about a circle, in such manner, as that all its sides are tangents to the circumference.

The term is sometimes also used for the describing of a circle about a polygon; so, as that each side is a chord. But in this case, we more usually say, the polygon is inscribed, than the circle circumscribed.

Any regular figure *ABCDE*, (Tab. *Geometry*, fig. 29.) inscribed in a circle, is resolved into equal and similar triangles, by radii drawn from the center of the circumscribing circle *F*, to the several angles of the figure; and its area is equal to a right-angled triangle, whose base is equal to the circumference of the whole polygon; and its height a perpendicular let fall from the center *F* to one side *AB*.

The same may be said of the area of the circumscribing circle *abcde*, (fig. 28.) excepting that the height is to be the radius. The area of every polygon that can be inscribed in a circle is less; and that of every polygon that can be circumscribed, greater than that of the circle: in like manner, the perimeter of the first is less, and that of the second is greater than the circumference of the circle.

On this principle Archimedes attempted the quadrature of the circle; which is nothing else, in effect, but the measuring of the area, or capacity of a circle.

The side of a hexagon is equal to the radius of a circumscribed circle.

To circumscribe a circle about any given regular polygon, *ABC*; (fig. 28.) and vice versa. Bisect two of the angles, *v. g.* *A* and *B*; and on the point *F*, where the two lines of bisection intersect, as on a center, describe a circle with the radius *FA*.

To circumscribe a Square about a Circle. Draw two diameters, *AB* and *DE*, (fig. 31.) intersecting each other in the center *C*, at right angles. From *AEBD*, with the interval of the radius, make intersections in *F*, *G*, *H*, *I*. Draw the right lines *FG*, *GH*, *IH*, and *IF*. Then is *FGHI* a square circumscribed about the circle.

To circumscribe any regular polygon, *v. g.* a pentagon, about a circle. Bisect the chord *AE*, (fig. 28.) by the perpendicular *FG*, which continue till it cut the arch in *G*. Through *A* and *E*, draw the radii *AF* and *EF*: and through *G*, draw a line parallel to *AE*, meeting the radii continued on each side in *a* and *e*: then is *ae* one side of the circumscribed polygon. Produce the radius *FB* to *h*, till *Fh = Fa*; and draw *ab*: this is another side of the polygon; and in the same manner may the rest of the sides be drawn.

To inscribe any regular polygon in a circle. Divide 360 by the number of sides, in order to find the quantity of the angle *EFD*; which make at the center, and apply the chord to the periphery as often as it will go. Thus will the desired figure be inscribed in the circle.

CIRCUMSTANCES, the incidents of an event, or the particularities that accompany an action.

Divines say, the conversion of a sinner depends on a certain assemblage, and a certain management of external *Circumstances* in the midst whereof he is placed; which arrangement of *Circumstances*, depends on the providence of God: whence conversion also depends on him.

The *Circumstances* of the actions of men, are expressed in this Latin verse.

Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando.

Quis, who, denotes the quality, state, age, &c. of the person. *Quid*, what, the greatness, smallness, multitude, fewness, &c. of the thing. *Ubi*, where, the place. *Quibus auxiliis*, with what assistances, the instruments, means, &c. *Cur*, why, on what account, with what view. *Quomodo*, how, the quality of the action, as to intention or remissness, designedness, or casualty, secrecy, or openness. *Quando*, when, the time; as on a holiday, at the hour of prayer, &c.

CIRCUMSTANTIBUS, in law, is used for the supplying, and making up the number of jurors, (in case any impanelled appear not; or appearing, be challenged by either party) by adding to them so many of the persons present, or standing by, as will serve the turn.

CIRCUMVALLATION*, in fortification, a line or trench, with a parapet, thrown up by the besiegers, encompassing all their camp to defend it against any army that may attempt to relieve the place.

* The word is formed from the Latin *circum*, about, and *vallum*, wall, or mound.

This line is to be cannon-shot distant from the place, ordinarily, about 12 foot broad, and seven deep. It is bordered with a breast-work, and flanked with redoubts, or little forts, erected from space to space. It serves both to prevent any success from being sent into the place, to keep in deserters, and to prevent incursions of the enemy's garison.

Care must be taken that the line of *Circumvallation* never pass

VOL. I.

by the foot of an eminence; left the enemy seizing on the eminence, lodge his cannon, and command the line.

CIRCUMVOLUTIONS*, in architecture, the turns of the spiral line of the Ionic volute.

* The word comes from the Latin *circumvolvere*, to turn around; and is also applied to the turns of a wreath, or twisted column. See *COLUMN*.

CIRCUS*, in antiquity, a large building, either round, or oval; used for the exhibiting of shows to the people.

* Some derive the word from *Circus*, to whom Tertullian attributes the invention. Cassiodorus says, *Circus* comes à circuitu—The Romans, Servius observes, at first, had no other *Circus*, but that made by the Tiber, on one side, and a palisade of naked swords on the other. Hence, according to Isidore, came the term *ludi circenses*, quasi *circum-enses*. But Scaliger laughs at that etymology.

The Roman *Circus*, was a large oblong edifice, arched at one end; encompassed with porticos, and furnished with rows of seats, placed ascending over each other.

In the middle was a kind of foot-bank, or eminence, with obelisks, statues, and posts at each end. This served them for the courses of their bigae and quadrigae.

There were no less than ten *Circus*'s at Rome: the largest was that built by the elder Tarquin, called *Circus Maximus*; between the Aventine and Palatine mounts. Pliny says, it was enlarged by J. Cæsar, so as to take in no less than three stadia in length, and one in width.

The most magnificent *Circus*'s were those of Augustus and Nero. There are still some remains of the *Circus*'s, both at Rome, at Nismes, and other places.

The Romans were excessively fond of the games exhibited in the *Circus*, witness that verse in Juvenal,

Atque duas tantum res anxius optat,

Panem & Circenses—

The Games of the *CIRCUS*, which some call *CIRCENSEAN Games*, were combats celebrated in the *Circus*, in honour of Confus the god of councils; and thence also called *Consualia*.

They were also called *Roman Games*, *Ludi Romani*, either on account of their antiquity, as being coeval with the Roman people, or because established by the Romans: and the games held here, the great games, *ludi magni*, because celebrated with more expense and magnificence than any others; and because held in honour of the great god Neptune, who was their Confus.

Those who say they were instituted in honour of the sun, confound the *pompa circensis*, or procession of the *Circus*, with the games.

The games of the *Circus* were instituted by Evander, and re-established by Romulus: the pomp, or procession, was only a part of the games, making the prelude thereof; and consisting of a simple cavalcade of chariots.

Till the time of the elder Tarquin, they were held in an island of the Tiber; and were called *Roman Games*: after that prince had built the *Circus*, they took their name therefrom; as being constantly held there.

There were six kinds of exercises in the *Circus*: the first was wrestling, and fighting with swords, with staves, and with pikes: the second was racing: the third saltatio, dancing: the fourth disci, quoits, arrows, and cestus; all which were on foot: the fifth was horsecourling: the sixth courses of chariots, whether with two horses, or with four.

In this last exercise, the combatants were at first divided into two squadrons or quadrils; then into four; each bearing the names of the colours they wore; *saetia alba, rufsa, &c.*

At first there was only white and red; then green was added, and blue. Domitian added two more colours, but they did not hold.

It was Oenomaus who first invented this method of distinguishing the quadrils by colours. The green was for those who represented the earth; the blue for the sea, &c.

CIRRI, in botany, a term used for those fine strings, or hairs, by which some plants fasten themselves to walls, &c. for their support; as ivy, and the like.

CIRSOCELE*, in medicine, a multitude of varices in the testicles, which prodigiously increase their bulk, and hinder the due preparation of the seed: so as sometimes even to render castration necessary. This disorder is otherwise called *hernia varicosa*.

* The word comes from the Greek *κισσος*, varix, vein, and *κωνη*, hernia. See *VARIX*.

CISALPINE*, any thing on this side the Alps.

* The word is formed from the preposition *cis*, on this side, and *Alpes*; which, though properly confined to the mountains separating Italy and France, yet is used by authors for any very high mountains.—Thus, Ausonius speaks of the Alps of the Pyreneans, the Alps of the Apennines, &c.

The Romans divided Gaul, and the country now called Lombardy, into *Cisalpine* and *Transalpine*.

That which was *Cisalpine* with regard to the Romans, is *Transalpine* with regard to us.

CISSOID, in geometry, an algebraic curve, first invented by Diocles; whence it is peculiarly called the *Cissoid of Diocles*. See *CURVE*.

The genesis of the *Cissoid* may be thus conceived: To the diameter A B, (Tab. *Analysis*, fig. 9.) of the semicircle A O B, draw an indefinite line, at right angles, B C: then, draw the right line A H, and make $AM = IH$; or in the other quadrant, $LC = AN$. Thus will the points M and L be in a curve line, A M O L; which is the *Cissoid* of Diocles.

Properties of the Cissoid.—From the genesis it follows, 1. That drawing the right lines P M and K L, perpendicular to A B; we shall have $AP : KB :: AM : IH$. But $AM = IH$; consequently, $AP = AB$. And therefore, $A K = PB$; and $PN = IK$.

2. After the same manner, it appears, that the *Cissoid* A M O bisects the semicircle A O B.

3. Again, $AK : KI :: KI : KB$. That is, $AK : PN :: PN : AP$. And again, $AK : PN :: AP : PM$; therefore, $PN : AP :: AP : PM$. Consequently, AK, PN, AP , and PM , are four lines in continual proportion. And if $PN = v$, $AP = x$, $PM = y$; $x^2 = vy$. And after the same manner it may be shewn, that AP, PN, AK , and $K L$, are in continual proportion.

4. In the *Cissoid*, the cube of the abscissa A P, is equal to a solid arising from the square of the semiordinate P M, multiplied into the complement of the diameter of the generating circle P B.

Hence, when the point P falls on B, then $x = a$, and B C

$= y$; consequently, $y^2 = \frac{a^3}{x}$. Wherefore, $o : x :: a^2 : y^2$.

that is, the value of y becomes infinite: and therefore the *Cissoid* A M O L, though it continually approach B C, yet they will never meet.

5. B C, therefore, is an asymptote of the *Cissoid*.

The antients made use both of the conchoid and *Cissoid*, for the finding of two mean continual proportionals between two given right lines.

For the *quadrature, subnormal, and subtangent of the Cissoïd*: see *QUADRATURE, SUBTANGENT, &c.*

Cissoïd Angle. See the article *ANGLE*.

CISTERCIANS, an order of religious, reformed from the Benedictines, consisting of an hundred monasteries, and near as many nunneries.

The order took its rise in 1075, from twenty-one zealous monks in the monastery of Moleme in Burgundy; who, with their abbot Robert, complaining that the rule of S. Benedict was not strictly enough observed; obtained permission of Hugh archbishop of Lyons, and legate of the holy see, to settle in a place called *Cistercium*, five miles from Dijon.

Here, Eudes duke of Burgundy erected them a house, into which they were admitted in 1098; endowing it with a considerable revenue. The bishop of Chalons gave Robert the pastoral staff, in quality of abbot; and erected the new monastery into an abbey.

Such was the beginning of the *Cistercians*, so famous in after-times, and now so extended throughout all Europe.

*CISTERNE**, is properly used for a subterraneous reservoir of rain-water.

* The word, according to some, comes from *cis*, and *terram*, i. e. *inter terram*; others derive it from *cista*, a duct, &c.

Earthen *Cisterns* must be made with good cement, to retain the water. And the bottom should be covered with sand, to sweeten and preserve it.

Authors mention a *Cistern* at Constantinople, the vaults whereof are supported by two rows of pillars, 212 in each row; each pillar being two foot in diameter. They are planted circularly, and in radii tending to that in the center.

CISTIC } See *CYSTIC*.

CIST-HEPATIC. } See *CYST-HEPATIC*.

CISTIS. See the articles *CYSTIS*, and *HYPOCISTIS*.

CISTRUM. See the article *SISTRUM*.

CISTULA Catoptric. See the article *CATOPTRIC*.

*CITADEL**, or *CITADEL*, a fort, or place fortified with four, five, or six bastions; built sometimes in the most eminent part of a city, and sometimes only near the city.

* The word is a diminutive of the Italian *citta*, city, *q. d.* little city.

In the first case, the *Citadel* serves to defend the city against enemies.

In the latter, it serves to command it, and to keep the inhabitants in their obedience: for which purpose the city is left unfortified on the part toward the *Citadel*, but the *Citadel* is fortified toward the city.

The most usual form for *Citadels*, is that of a pentagon: a square being too weak, and a hexagon too large.

There is always a large esplanade between the city and *Citadel*. See *ESPLANADE*.

*CITATION**, in the ecclesiastical courts, a summons to appear before an ecclesiastical judge, on some affair relating to the church.

* The word comes from *cito*, of *cito*, I stir up.

In the civil and ordinary courts, it is called *summoning*.

CITATION is also used in speaking of military and monastic, as well as ecclesiastical courts. Such a heretick was *cited* to Rome; to a general council, &c.

Knights are *cited* to the general chapters of their order.

King Edward I. of England, was *cited*, by order of Philip IV. of France, to a court of his peers: The *Citation* was published by the Seigneur d'Arbray, Seneschal of Perigord and Querci; and was patted up, by his order, on the gates of the city Libourne, which then belonged to king Henry. And for default in not appearing, all his domains, and effects in France were confiscated. F. Daniel.

CITATION is also an allegation, or quotation of some law, authority, or passage.

CITHARA, an antient musical instrument, by some supposed the same with the lyra; or at least, a particular species of the lyra; by others different: though its precise structure does not appear to be known.

The antients describe it as triangular, in form of a Greek Delta, Δ : the poets ascribe the invention of it to Apollo.

*CITIZEN**, or *CITTIZEN*, a native or inhabitant of a city, vested with the freedom and rights thereof.

* The word comes from the Latin *civis*; which authors derive from *civis*, by reason the *Citizens* live together; or rather from *civis*, I call together.

Augustus, upon numbering the Roman *Citizens*, found they amounted to upwards of four millions.

To make a good Roman *Citizen*, there were three things required: that he were an inhabitant of Rome; that he were enrolled in one of the 35 tribes; and that he were capable of dignities.—Those strangers to whom were granted the rights and privileges of Roman *Citizens*, were properly only *honorary Citizens*.

The seventh law, *de incolis*, makes a great deal of difference between a *Citizen* and a mere inhabitant. Birth, alone, made a *Citizen*; and entitled to all the privileges of Burgesy: time could not acquire it; but the emperor could bestow it.

CITRON, an agreeable fruit, in colour, taste, smell, &c. resembling a lemon; and serving, like that, to cool, and quench thirst: being produced by a tree of the same name, much resembling the lemon-tree.

The *Citron* is distinguished from the lemon, in that it is bigger, and its pulp firmer; its smell brisker, and colour higher. It is held excellent against poisons: and Athenæus relates an instance of two persons said to be preserved safe from the most dangerous aspics, by only eating a *Citron*.

The distillers, perfumers, confectioners, &c. procure divers things from *Citrons*; as essences, oils, confections, waters, &c.

CITRON-WATER. See the article *CITRON-WATER*.

CITRON-SANTAL. See the article *SANTAL*.

CITY, or *CITTY*, *Urbs*, a large town inclosed with a wall.

It is hard to give any just definition of a *City*; in regard, custom has reserved the appellation of towns, to many places which seem to have every thing requisite to constitute *Cities*.

Formerly, *City* was only understood of such towns as were bishop's sees: which distinction seems still to hold in England; though no where else. See *BISHOP*, and *DIOCESE*.

The term *City* had its rise among us, since the conquest; for in the time of the Saxons there were no *Cities*, but all great towns were called *Burghs*.—Thus, London was called *Lunden Burgh*. See *BURGH*.

And for a long time after the conquest, *City* and *Burgh* were used promiscuously.—Thus, in the charter of Leicester, that place is called both *civitas* and *burgus*; which shews a mistake in my lord Coke, where he tells us, that every *City* was, or is a bishop's see. Nor had Gloucester any bishop then; though it is called a *City* in Dome's-day. The like may be observed of Cambridge; to which it may be added, that Crompton, reckoning up our *Cities*, leaves out Ely, though it had a bishop and a cathedral.

Yet Chaffanæus de *Consuetud. Burgund.* says, France has within its territories 104 *Cities*; and gives his reason, because it has so many archbishops, and bishops.

CITY is particularly used to express the heart of the place. At Paris they have the *City*, and the *University*; at London we have the *City* and the *Suburbs*.

Advocate of a *CITY*.

Capital *CITY*.

College of *CITIES*.

Forest *CITIES*.

Freedom of a *CITY*.

Honours of the *CITY*.

Imperial *CITIES*.

Municipal *CITIES*.

Provost of the *CITY*.

CITY, *CIVITAS*, in speaking of antiquity, signifies a state, or people, with all its dependencies, constituting a particular republic.—Such as are, still, several *Cities* of the empire, and the Swiss cantons.

Though

Though the ancient Gauls were, in effect, only one nation; they were yet divided into several peoples, which formed as many different states: or, to speak with Cæsar, as many different *Civitates, Cities*. Besides that each *City* had its particular assemblies, it sent deputies, too, from time to time, to the general assemblies held on affairs relating to their common interest.

CIVET *, a kind of perfume, bearing the name of the animal whence it is taken.

* The word comes from the Arabic *Zibet*, or *Zebed*, scum, froth.

The *Civet*, or *Civet-cat* *, is a little animal, not unlike our cat; excepting that its snout is more pointed, its claws less sharp, and its cry different.

* Some naturalists will have it the same with the hyena of Aristotle, and call it *hyæna odorifera*. Others suppose it the panther of the ancients, while the generality take it for a kind of wild cat, and call it *felis zibetica* on account of the perfume it yields, which the Arabs call *zibit*. It is a native of Africa, the Indies, Peru, Brazil, Guinea, &c.

The perfume this animal produces, is formed like a kind of grease, or thick scum, in a receptacle, or bag, under its tail, between the anus and pudendum of the creature *.

* An ample description of the *Civet bag*, its glands, the reservoirs of the perfume, &c. is given by M. Morand in Mem. Acad. R. Scienc. An. 1728. p. 568. § 99.

It is gathered from time to time; and still abounds, in proportion as the animal is fed.

There is a very considerable traffic of *Civet*, from Bassora, Calicut, and other places, where the animal that produces it is bred. Though, great part of the *Civet* among us is furnished us by the Dutch; who bring up a considerable number of the animals. Before any of these animals were seen in Europe, or it had been observed how the perfume had been gathered, the common opinion, founded on the relations of travellers, was, that it was the sweat of that animal, when irritated and provoked into rage. To this effect, it was said, that the animal was inclosed in an iron cage; and after having been a long time beaten with rods, they gathered with a spoon, through the bars of the cage, and between the thighs of the animal, the sweat or foam, which the rage and agitation had produced: and that without this precaution, the animal would yield no perfume at all.

But experience has taught us better; and we now know, that the perfume *Civet*, is only a thick unctuous humour, secreted by certain glands between the two tunics of the bag wherein it is amassed, under the creature's tail, beneath the anus.

Civet must be chosen new, of a good consistence, a palish colour, and a strong smell.

Besides the Indian and Dutch *Civet*, there is also a *Civet* from Brazil, or Guinea, like that of India; and an accidental *Civet*, which bears no resemblance to it: this being only a term used to express the human excrements.

Civet is little used in medicine, except in a thickness of hearing, from cold; where a grain or two being put in a little cotton, or wool, and the ears stopped therewith, is sometimes of service. It is much used among perfumers and confectioners.

See Supplement, article *ZIBETHICUM Animal*.

CIVIC, **CIVICUS**, an epithet applied to a kind of crown, made of oak leaves; antiently bestowed by the Romans, on those who saved the life of a fellow-citizen in a battle, or an assault. The *Civic* crown was exceedingly esteemed; and was even given as an honour, to Augustus; who on this occasion struck coins with this device, *OB CIVIS SERVATOS*.—It was also granted to Cicero; after his discovery of Catiline's conspiracy.

CIVIL, **CIVILIS**, in its general sense, denotes something that regards the policy, public good, or peace of the citizens, or subjects of a state.

In this sense, we say, *Civil* government; *Civil* law; *Civil* rights; *Civil* war, &c.

CIVIL, in a legal sense, is also applied to the ordinary procedure in an action relating to some pecuniary matter, or interest.—In which sense it is opposed to criminal.

CIVIL Action. See the article *ACTION*.

CIVIL Architecture. See the article *ARCHITECTURE*.

CIVIL Day. See the article *DAY*.

CIVIL Death, any thing that retrenches, or cuts off a man from *Civil* society: as, a condemnation to the galleys, perpetual banishment, condemnation to death, outlawry, and excommunication; all which make a man cease to be looked on as a citizen.

The term is likewise applied to those who are no longer capable of acting in temporal concerns: as, those who renounce the world, who retire and make vows in a monastery, &c.

CIVIL Fruits. See the article *FRUITS*.

CIVIL History. See the article *HISTORY*.

CIVIL Law, *Lex CIVILIS*, is defined, in the institutes, to be the laws peculiar to each city, or each people.—But in the modern use, it properly implies the Roman law, contained in the institutes, the digest, and the code; otherwise called, *lex scripta*, or the *written law*.

The Roman law, at its commencement, was very inconsiderable. Under the kings, the people were governed by certain laws, prepared by the senate, passed by the kings, and confirmed in an assembly of the people,

Papirius was the first who made a collection of the regal laws; which took its name from its author, and was called *jus papirianum*.

The Republic, after abolishing the regal government, still retained the royal laws: to these they added the law of the twelve tables, drawn by the Decemviri, from the laws of twelve of the principal cities of Greece; and the more equitable among the laws hitherto practised at Rome.

The law of the twelve tables was at length found so severe, and conceived in such obscure terms; that it was judged proper to moderate, restrain, and ascertain it, by other laws, proposed to the senate by the consuls, and passed at general assemblies of the people; according to the practice that had obtained under the kings themselves.

In the year of Rome 731, the Republic expired; and the whole power of the people was transferred to Augustus, who was contented to publish his new laws in the assembly of the people; to keep up some image of the Republic by this formality. Tiberius abolished these occasional assemblies, on pretence of their being too numerous; and in lieu thereof offered his laws to the senate, who never failed to confirm them: inasmuch that the laws of Tiberius, and his successors, who kept the same measures with the senate, were esteemed *senatus consulta*. Thus arose two kinds of Roman law, with regard to the changes in the legislative authority: the laws established by the people, *Plébiscita*; and the laws of the emperors, or *imperial laws*.

During the time of the republic, and even under the emperors, there were *juris-consulti*; who making publick profession of the study of the law, interpreted, were consulted on the different senses of the laws, and gave answers to the questions proposed to them hereon; which were called *responsa prudentum*.

Papirius was the first of these *juris-consulti*, after the expulsion of the kings; and Modestinus was the last. See *JURIS-CONSULTUS*.

After him, viz. in 240, these oracles of the Roman jurisprudence ceasing, out of their writings, which made no less than 2000 volumes, a body of the Roman law was afterwards compiled, by order of Justinian.

The magistrates, on their side, in administering justice, interpreted the laws with more freedom than even the *juris-consulti*, and were, as it were, the living voice of the law.

The emperors too, to render the interpretation of the magistrates less free and frequent, appointed, that they themselves should be consulted; and their answers expected, as to questions in law: as may be observed from Pliny's epistles to Trajan.

In proportion as new laws were made at Rome, care was taken to collect and reduce them into bodies. Papirius, as before observed, in the time of Tarquinius Superbus, made a collection of the regal laws. And no sooner was the republic established, than the body of laws of the twelve tables was compiled.

In the time of Julius Cæsar, Offilius, a lawyer, began a collection of the edicts of the prætors; but this was not finished till the time of Adrian, by another lawyer, Julianus.

In the time of Constantine, or his children, two *juris-consulti* compiled two codes; from their authors called the *Gregorian*, and *Hermogenian Code*. See *CODE*.

Lastly, Justinian, finding the authority of the Roman law almost abolished in the west, by the declension of the empire; resolved to make a general collection, of the whole Roman jurisprudence; and committed the care thereof to his chancellor Tribonianus.

That minister executed his commission with a great deal of diligence, not to say precipitation: a new code was finished in 529, and a digest in 533.

The same year he published an abridgment thereof, containing the first principles and elements of law, under the title of *institutes*.

In the course of this reign, Justinian made 168 constitutions, and 13 edicts; which made a considerable alteration in the antient law, and were called *novels*.

All these together, make the *corpus juris civilis*, or body of the *civil law*, as reduced, by order of Justinian.

For the space of 300 years, this system of law obtained without any innovation. But the new constitutions made by the emperors from time to time, at length occasioning some alterations; the emperor Basil, and Leo his son, composed a new body of the Roman law, chiefly from the Justinian, in the Greek language; dividing it into seven volumes, and 60 books; under the title of *Basilica*. From which time, Justinian's body had but little credit in the east; the *Basilica* taking place of it.

In the west, the *Civil Law* had a different fortune: it is ordinarily supposed not to have been there known till the year 600; when Lotharius II. finding the book at the taking of Melphi, a town in Naples, made a present of it to the city of Pisa: though we find it quoted in several Latin works long before Lotharius. It is true, however, it was never taught publicly till the twelfth century; when Irnerius first made profession of it at Bologna, in 1128; whence it was carried by his disciples into other countries; and in a little time was taught in all the universities.

It is allowed that the *Civil* law contains all the principles of natural equity; and that nothing can be better calculated to form good sense, and sound judgment. Hence, though in several countries it has no other authority but that of reason, and justice; it is every where referred to for authority, and is that alone taught in the Universities.

It is not received at this day in any nation without some alterations: sometimes the feudal law is mixed with it, or general and particular customs; and often, ordinances and statutes cut off a great part of it.

In Turkey, the *Baslicks* are only used. In Italy, the canon law, and customs, have excluded a good part of it. In Venice custom hath almost an absolute government. In the Milanese, the feudal law, and particular customs, bear sway. In Naples and Sicily, the constitutions and laws of the Lombards are said to prevail. In Germany and Holland, the *Civil Law* is esteemed to be the municipal law: but yet many parts of it are there grown obsolete; and others are altered, either by the canon law, or a different usage.

In Friesland, it is observed with more strictness: but in the northern parts of Germany, the *jus Saxonicum*, *Lubecken*, or *Culmen*, is preferred before it. In Denmark and Sweden it hath scarce any authority at all. In France only a part of it is received; and that part is in some places as a customary law: and in those provinces nearest to Italy, it is received as a municipal written law. In criminal causes, the *Civil Law* is more regarded in France; but the manner of trial is regulated by ordinances and edicts.

The *Civil law*, in Spain and Portugal, is connected with the *jus regium* and custom. In Scotland, the statutes of the *Sederunt*, part of the *regie majestatis*, and their customs, controul the *Civil law*.

In England, it is used in the ecclesiastical courts; in the courts of the admiralty; and in the two universities: yet in all these it is restrained and directed by the common law. See *LAW*, *COMMON-LAW*, &c.

CIVIL-Month. See the article *MONTH*.

CIVIL Obligation. See the article *OBLIGATION*.

CIVIL War, is a war between people of the same state, or the citizens of the same city.

CIVIL Year, is the legal year, or annual account of time, which every government appoints to be used within its own dominions. See *TIME*.

It is thus called, in contradistinction to the natural year; which is measured exactly by the revolution of the heavenly bodies.

CIVILIANS College. See the article *COLLEGE*.

CIVILISATION, a law, or judgment, which renders a criminal process, civil. See *CIVIL*, &c.

Civilisation is performed by turning the information into an inquiry, or vice versa.

CLAIM, in law, a challenge of interest in any thing that is in possession of another; at least of a man's own. See *CHALLENGE*, *POSSESSION*, &c. See also *NON-CLAIM*.

There are divers kinds of *Claims*: as *Claim by charter*, by descent, by acquisition, &c.

Continual CLAIM, a *Claim* made from time to time, within every year and day, to land, or other thing, which on some accounts, cannot be attained without danger.

Thus, if I am dispossessed of land, into which, though I have a right, I do not enter for fear of being beaten; I am to hold on my right of entry at my best opportunity; by approaching as near as I can, once every year, as long as I live: and thus I leave the right of entry to my heir.

False CLAIM. See the article *FALSE*.

Quit CLAIM. See the article *QUIT*.

CLAIR-OBSCURE, or *CHIARO-SCURO*, in painting, the art of distributing to advantage, the lights and shadows of a piece; both with regard to the eating of the eye, and heightening the effect of the whole composition.

Thus, when a painter gives his figures a strong relief, loosens them from the ground, and sets them free from each other, by the management of his lights and shadows; he is said to understand the *Clair-obscur*.

The *Clair-obscur* makes one of the great divisions, or branches of painting; the whole of a picture being resolvable into light and shadow.

The doctrine of the *Clair-obscur*, will come under the following rules.—Light may either be considered with regard to itself; to its effects; the place wherein it is diffused; or its use. For the 1st, light is either *natural*, or *artificial*.

Natural, either comes immediately from the sun, which is brisk, and its colour various, according to the time of the day; or it is that of a clear air through which light is spread, and whose colour is a little bluish; or of a cloudy air, which is darker, yet represents objects in their genuine colours with more ease to the eye.

Artificial light, proceeds from fire, or flame, and tinges the object with its own colour: but the light it projects, is very narrow and confined.

For the 2^d, the effects of light are either *principal*, as when the rays fall perpendicularly on the top of a body, without

any interruption; or glancing, as when it slides along bodies: or *secondary*, which is for things at a distance.

3. For the place, it is either the open campaign, which makes objects appear with great softness; of an inclosed place where the brightness is more vivid, its diminution more hasty, and its extremes more abrupt.

4. For the use, or application: the light of the sun is always to be supposed without, and over-against the picture; that it may heighten the foremost figures; the luminaries themselves never appearing, in regard the best colours cannot express them. The chief light is to meet on the chief group, and as much as possible on the chief figure of the subject. The light is to be pursued over the great parts, without being crossed, or interrupted with little shadows. The full force of the principal light to be only in one part of the piece: taking care never to make two contrary lights. Not to be scrupulously confined to one universal light; but to suppose other accessory ones, as the opening of clouds, &c. to loosen some things, and produce other agreeable effects. Lastly, the light to be different, according to the quality of the things whence it proceeds, and the nature of the subjects which receive it. For shadows; they are distinguished, 1^o, into those formed on the bodies themselves, by their proper reliefs. 2^o, Those made by adjacent bodies: those that make parts of any whole; and the different effects, according to the difference of places.

For the first, since the different effects of lights only appear by shadows, their degrees must be well managed. The place which admits no light, and where the colours are lost, must be darker than any part that has relief, and disposed in the front. The reflex, or return of the light, brings with it a colour borrowed from the subject that reflects it; and flies off at a greater or less angle, according to the situation of the reflecting body, with regard to the luminous one: hence, its effect must be different in colour, and in force; according to the dispositions of bodies. Deepenings, which admit not of any light, or reflex, must never meet on the relief of any member of any great elevated part; but in the cavities or joints of bodies, the folds of draperies, &c. And to find occasions for introducing great shadows to serve for the repose of the sight, and the loosening of things; instead of many little shadows, which have a pitiful effect.

For the 2^d, the shadows made by bodies, are either in plain and smooth places, or on the earth; wherein they are deeper than the bodies that occasion them, as receiving less reflex light; yet still diminish as they depart further from their cause; or they are on the neighbouring bodies, where they are to follow the form of the said bodies, according to their magnitude and position, with regard to the light.

For the 3^d, In shadows that have parts, the painter must observe to take for a light in a shadowed place, the tint, or lustre of the light part; and, on the contrary, for the shadow in the lightened part, the tint, or lustre in the shadow: to make an agreeable assemblage of colour, shadow, and reflex in the shadowed part; but without interrupting the great masses of shadow: to avoid forming little things in the shadow, as not being perceived, unless closely looked at; and to work, as it were, in the general, and at one sight: never to set the strong shadows against the lights, without softening the harsh contrast by the help of some intermediate colour: though the mass of light may be placed either before or behind that of the shadow; yet ought it to be so disposed, as to illumine the principal parts of the subject.

For the 4th, The effect of shadows are different, as the place is either wide and spacious; as in those coming immediately from the sun, which are very sensible, and their extremes pretty abrupt; from the serene air, which are fainter and more sweet; from the dark air, which appear more diffused, and almost imperceptible; and those from an artificial light, which makes the shadows deep, and their edges very abrupt; or as it is more narrow and confined, where the lights coming from the same place make the shadow more strong, and the reflex less sensible.

CLAIR-OBSCURE, *CHIARO-SCURO*, is also used for a design consisting only of two colours; ordinarily black and white, sometimes black and yellow.

Or, it is a design only washed with one colour; the shadows being of a dusky brown colour, and the lights heightened up with white.

The word is also applied to prints of two colours, taken off at twice; whereof there are volumes in the cabinets of the curious in prints.

The word *Clair-obscur* is a compound of two others. *Clair* is used among the French for those parts of a painting which reflect the most light; and comprehends not only the lights themselves, but also those colours that are luminous. By *obscur*, is meant not only all the shades, but also all the colours that are dusky.

CLAMEA admittenda in itinere per attuturnum, is a writ whereby the king commands the justice in eyre to admit a person's *Claim* by an attorney, who being employed in the king's service, cannot come in person.

CLAMOR, or *CLAMEUR de Hara*, a popular term in the French laws, importing a complaint, or cry, whereby any one implores the assistance of justice against the oppression of another.

CLAMP, in a ship, a piece of timber applied to a mast, or yard, to strengthen it, and prevent the wood from bursting.

CLAMP, also denotes a little piece of wood, in form of a wheel; used instead of a pulley in a mortice.

CLAMPING, in joinery, &c.—When a piece of board is fitted with the grain, to the end of another piece of board cross the grain; the first board is said to be *clamped*.—Thus the ends of large old tables were commonly *clamped*, to preserve them from warping.

CLAMP-NAILS, are such nails as are used to fasten on *Clamps*, in building and repairing of ships.

CLANCULARII, a sect of Anabaptists, who denied the necessity of making an open profession of the faith; and taught that a private one would be sufficient.

These were also called *Hortulani*, and *Gardeneri*, from the places they chose to assemble in, instead of churches.

CLANDESTINE *, any thing done secretly, and without the knowledge of some of the parties interested in it; or without the proper solemnities.

* The word comes from the preposition *clam*, of *κλεμν*, *claudes*, *clut*, or *κλεμν*, *furtum*, theft.

Thus, a marriage is said to be *Clandestine*, when performed without the publication of banns, the consent of parents, or the knowledge of the ordinary.—The council of Trent, and the French ordinances annul all *clandestine* marriages.

CLAP, in medicine, the first stage, or state of the venereal disease; called also a *Gonorrhœa*.

Dr. Cockburn, and others after him, will have the *Clap* to consist in an ulceration of the mouths of the glands of the urethra in men, and of the glandular lacunæ in women; occasioned by the insinuation of an acrimonious, purulent matter, contracted from an infected person in *actu coitus*. From these glands, issues or gleans a sharp corrosive matter, accompanied with heat of urine, chordee, &c. which makes what is usually termed the first stage of the distemper.

A *Clap* appears sometimes sooner, and other times later, though generally in about three or four days after the infection is received; and discovers itself by the running, &c. of the penis, with inflammation of the glands, or nut of the yard.

If the person be affected with a phimosis, or paraphimosis; if the running be of a thin consistence, a yellow or green colour, and in great quantity, and the testicles swelled, it is usually termed a *gonorrhœa virulenta*; and the *Clap* supposed to be in its second stage.

Some authors think, that in this degree, or stage, the infection has reached the mass of blood, and the vesiculæ feminales; others insist, that these symptoms may be accounted for from the running, or virus, being more corrosive; and by that means irritating and inflaming the adjacent parts.

The cure of a *Clap* consists in proper evacuations, as calomel-purgatives, refrigerant emulsions, powders, &c. turbithe-emetics, and lastly, proper terebinths, &c. to which some add decoctions of the lignum vitæ. As to externals, they are generally comprehended under the form of fomentations, cataplasms, liniments, and lotions.

Late authors, and especially Dr. Cockburn, have insisted on the cure of a *Clap* by a particular injection, without the use of any other medicine.—This has given a handle to quacks, who, by affecting to do the same by their injections, generally check the running, and make a confirmed pox.

Turbithe-mineral, calomel, &c. given in small doses, and continued for some time, so as to take effect by way of alteratives, have been lately much commended as to success. Mercurial unguents, used in small quantities, so as not to raise a salivation, are said to cure all the stages of the venereal disease: this practice is usual at Montpellier.

Mr. Becket, in the *Philosophical Transactions*, attempts to shew, that the disease we now call a *Clap*, is the same with that our forefathers called a *burning*, or *branning*; under which name it was known several hundred years before the commonly supposed origin of the venereal disease; and that the appellation *branning*, &c. was only discontinued as that of *Clap* commenced.

In a MS. as old as Henry IV. Arden, chirurgion to that prince, defines *branning* to be a certain inward heat and excoriation of the urethra; which, Mr. Becket observes, gives us a perfect idea of what we now call a *Clap*. For frequent dissections of such as have laboured under that disease, have made it evident, that the urethra is excoriated by the virulency of the matter they receive from the infected woman: which excoriation, or ulceration, he adds, is not confined to the ostioli, or mouths of the mucous glands of the urethra, as has been lately imagined; but may equally attack any part of the urethra.

The heat, or burning which such persons feel in making water, is a consequence of this excoriation of the urethra; the salts

contained in the urine pricking and irritating the *nervous fibrille* of the urethra, thus divested of its natural membrane. See *Supplement*, article *GORRORRHEA*.

CLARENCIEUX, the second king at arms; thus called from the duke of Clarence, to whom he first belonged.

Lionel, third son of Edward III. having by his wife the honour of Clare in the county of Thomond, was hereupon created duke of Clarence; which dukedom afterwards escheating to Edward IV. he made this herald, who properly belonged to the duke, a king at arms; naming him *Clarencieux* in French, and *Clarencius* in Latin.

His office is to marshal, and dispose of the funerals of all the lower nobility; as baronets, knights, esquires, and gentlemen on the south-side of Trent: whence he is also called *farroy*, or *fourroy*, in contradistinction to *narroy*. See *NORROY*.

CLARET *, or *CLAIRET*, *pale red*, a name which the French give to such of their red wines as are not of a deep, or high colour. See *WINE*.

* The word is a diminutive of *clair*, *clear*, bright, transparent.

CLARET, *CLARETUM*, in the antient pharmacy, was a kind of wine sweetened with sugar, and impregnated with aromatics; sometimes also called *hippocras*, or *vinum hippocraticum*; because supposed to have been first prescribed by Hippocrates.

It has its name *Clarit*, from its being clarified by percolation through a flannel bag, called *manica hippocratis*.

CLARICORD, or *Manicord*, a musical instrument, in form of a spinett.

It has 49 or 50 keys, and 70 strings, which bear on five bridges; the first whereof is the highest, the rest diminishing in proportion. Some of the strings are in unison; their number being greater than that of the stops.

There are several little mortises for passing the jacks, armed with little bras hooks, which stop and raise the chords in lieu of the feather used in virginals and spinetts. But what distinguishes it most, is, that the strings are covered with pieces of cloth; which render the sound the sweeter; and deaden it so, as that it cannot be heard to any considerable distance.

Hence some call it the *dumb spinett*; whence it comes to be particularly in use among the nuns, who learn to play, and are unwilling to disturb the silence of the dormitory.

The *Claricord* is more antient than either the spinett or harp-cord; as is observed by Scaliger, who, however, only gives it 35 strings.

CLARIFICATION, in chymistry, the act of clearing, or fining of liquors from their grosser parts.

Clarification is performed by ebullition, despumation, and colature, or filtration.

The term is chiefly applied to juices, decoctions, and syrups, which are *clarified* by filtration, or by passing them through a strainer, after having beat them up into a froth with the whites of eggs; the viscous parts of the eggs entangling the thick gross particles of the liquor, retain them in the strainer. Sometimes the mixture is boiled; by which means, the eggs entangle the grosser parts, and carry them up to the top in a tough scum; which is either taken off with a spoon, or separated by a flannel bag, as before, called *Hippocrate's sieve*. Another method is, by letting the liquor stand in a convenient vessel, till the grosser particles settle.

In distilled waters, &c. which have a milky hue, or are turbid, this is generally effected with fine sugar, mixed with a small quantity of allum; which will bear down the oily parts, and leave the rest clear.

Many liquors are clarified by passing them through a thick brown paper; among others, *hippocras*, *hydromel*, &c. The antients clarified their wines by pouring them from off the lees, into another barrel, through a tin strainer.

Fine and delicate wines are usually clarified with *ichthyocolla*, or fish-glue: the thicker wines with omelette, or whites of eggs diluted in water. Sometimes with pouring them through a heap of little chips.

It is an error to suppose that either *isinglass*, or omelette, can be prejudicial to the health; since both the one and the other fall down with the lees, without producing any ill effect. That which makes wines unwholesome, is not the *clarifying* by these innocent means, but the mixtures and sophistications of the vintners, to make them brisk, and bring them to life again after the fret; which is done with aqua vitæ, spices, pigeons dung, &c.

Sugar is *clarified* with the whites of eggs and sugar beat together.

For malt liquors, particularly beer, there are various methods of clearing; the best is by casting into it fixed nitre: some add the quintessence of malt and wine; whites of eggs made into balls with a little flower and *isinglass*: oil and quintessence of barley have the same effect. It is exceedingly cleared and strengthened, by adding to it, during the time of its fermentation, some ardent spirit. See *MALT LIQUOR*.

CLARIGATIO, or *CLARIGATION*, in the law of nations, a loud, clear call, or summons made to an enemy, to demand

satisfaction for some injury received; in defect whereof, recourse will be had to reprisals.

Clarigatio amounts to much the same with what the Greeks call *απαλφια*.—Though Naude uses the word in a somewhat different manner. Reprisals, says he, signify the same as *pigerationes* Budæ, aut *clarigationes* Hermolæ: for, as to the Greek word *απαλφια*, it is equivalent to the Latin *pigerandi potestas*.

CLARION *, a kind of trumpet, whose tube is narrower, and its tone acuter and shriller than the common trumpet.

* *Mense* derives the word from the Italian *Clarina*, of the Latin *Clarus*, by reason of the clearness of its sound.

Nicod says, the *Clarion*, as now used among the Moors, and the Portuguese, who borrowed it from the Moors, served anciently for a treble to several trumpets, which sounded tenor and bass. He adds, that it was only used among the cavalry and the marines.

CLARION, in heraldry, is a bearing represented in Tab. *Heraldry*, fig. 36.—He bears ruby, three *Clarions* topaz; being the arms of the earl of Bath, by the name of Granville.

Guillim takes these *Clarions* to be a kind of old-fashioned trumpets; but others rather think, they represent the rudder of a ship; and others a rest for a lance.

CLARO-OBSCURO. See **CLAIR-OBSCURE**.

CLARY WATER. See the article **WATER**.

CLASP NAILS. See the article **NAILS**.

CLASPERS, in botany, are tendrils, threads, or ligaments of a middle nature between that of a root, and trunk; whereby shrubs, and other lesser plants, take hold of trees, or other things near them, for their support, &c.

The wisdom of the creator is very conspicuous, in this provision for some species of plants, which need it; as ivy, vines, bryony, &c.

The contrivance is various in various subjects. Malpighi observes, that the *Claspers* of ivy are roundish, and covered with hair; and what is very remarkable, they yield a glutinous terebinthine humour, by means whereof, they adhere closely to stones, &c. Nature, he adds, uses no less artifice in the vitis canadensis.

Claspers serve sometimes for support only; as those of the vine, bryony, &c. whose branches being long, slender, and brittle, would be weighed down by their own load, and that of their fruit, but for these *Claspers*, which by a natural spine, or circumvolution, catch hold of any adjacent body.

Claspers sometimes also serve for a supply of juice; as in the trunk-roots of ivy, which being a tall plant, and of a compact substance, the sap would not be sufficiently furnished to the upper sprouts, without this expedient.

Claspers also sometimes serve for stailiment, as those of cucumbers; for propagation, as those of camomile; and for shade, stailiment, and propagation altogether, as those of strawberries.

CLASS *, **CLASSIS**, a distribution of persons, or things, ranged according to their merit, value, or nature. See **RANK**, &c.

* The word comes from the Latin *Classis*, derived by some from the Greek *κλαω*, *congrego*, *convoco*; a *Classis* being nothing but a multitude, assembled apart.

CLASS is particularly used for a distinction among scholars; who are distributed into several *Classes*, or forms, according to their capacities, and attainments.

Quintilian uses the word *Classis* in this sense, in the first book of his *institutes*.

CLASSIC, **CLASSICAL**, a term chiefly applied to authors read in the *Classes*, at schools, and who are in great authority there. In this sense, Aquinas, and the master of the sentences are *classic* authors in the school divinity; Aristotle, in philosophy; Cicero and Virgil in the humanities.—Aulus Gellius ranks among *Classic* authors, Cicero, Cæsar, Sallust, Virgil, Horace, &c.

The term *Classis* seems properly applicable only to authors who lived in the time of the Roman republic, and the Augustan age, when the Latin was in its perfection.

It appears to have taken its rise hence, that an estimate of every person's estate being appointed by Servius Tullius, he divided the Roman people into six bands, which he called *Classes*.

—The estate of those of the first *Classis* was not to be under 200 pounds: and these, by way of eminence, were called *Classici*, *Classici*.

Hence, also, authors of the first rank, came to be called *Classici*: all the rest were said to be *infra classim*.

The first *Classis*, again, was subdivided into centuries; making fourscore centuries of footmen, and eighteen of horsemen.

Each *Classis* consisted, one half of the younger sort, who were to make war abroad; and the other of old men, who staid at home for the defence of the city.

CLAUDENDA Curia. See the article **CURIA**.

CLAVELLATI Cineres, *Potashes*. See the article **CINERES**.

CLAVICULÆ, collar bones, in anatomy, two small bones, situate at the basis of the neck, and top of the breast.—See Tab. *Anatomy*, (*Osteol.*) fig. 3. n. 3, 3.

They are about half a foot long, of the thickness of a finger, and a little bent at each end, and that different ways, somewhat like the letter S; and are thus called, as being the keys, *clavus*, of the thorax.

Their inner substance is spongy; whence they are brittle, easily broke, and easily coalescing again.—They are joined to the acromion of the scapula per synchondrosia; and on the fore-part, per arthrodium, to a sinus on each side of the upper part of the sternum.

Their use is, to fix the scapulae with the sternum and the arms, and to prevent them from slipping too forward upon the thorax.

CLAVIS, a Latin word, sometimes used in English writers for a key.

CLAUSE, an article, or particular stipulation in a contract; a charge, or condition in a testament, &c.

We say, a *derogatory clause*, *penal clause*, *saving clause*, *coadjutary clause*, &c. See **DEROGATORY**, &c.

CLAUSIT extremum diem. See the article **DIEM**.

CLAUSTRAL Prior. See the article **PRIOR**.

CLAUSUM Fregit, an action of trespass; thus called, by reason the writ demands the person summoned to answer to *quarra clausum fregit*, of the plaintiff, why he committed such a trespass?

CLAVUS, in antiquity, a band, or fillet of purple, worn on the breast by the Roman senators and knights, more or less broad, according to the dignity of the person; from the proportions of which arose the difference of *twice angusticlavia*, and *laticlavia*. See **LATICLAVIA**, &c.

This ornament, according to some, was called *Clavus*, mail, as being studded with little round plates of gold, or silver; like the heads of nails. Cætelius maintains, that the *Clavus* consisted of a kind of purple flowers, sowed upon the stuff.

CLAVUS, in medicine, a name physicians give to a shooting pain in the head, commonly situate a little above the eyes, viz. on the sinus frontalis; and supposed to resemble a boring of the head through with an augre; whence the name. In some it is only in one, and in others in both sides.

It is generally allowed to be a species of an ague, or an intermitting fever; its periods of coming or going, being usually regular or stated. In some it is quotidian, in others tertian.

The cure consists in giving an emetic a little before the fit, and after, confirming it with a proper quantity of the cortex, &c. as in intermitting fevers; though bleeding and diaphoretics sometimes effect a cure without other assistants.

A pain like to this, on the top of the head, sometimes attacks hysterical persons; which by Dr. Sydenham is termed *Clavus Hystericus*.

CLAVUS is also used in medicine, for a callus formed on the toes; popularly called a *corn*.

Clavi arise from a too great compression of the cutis; which by this means hardens, and forms itself into a knot. The cure is by first softening them, as with emplast. de ranis cum mercurio, or with galban. crocat. with sal ammoniac; and then pulling them up. A piece of raw beef, applied in manner of a plaster, and frequently shifted, is often found to dissipate them in a little time.

CLAWS.—*Elk's CLAWS*. See the article **ELK**.

CLAY, in natural history, a soft viscous earth, found in various places, and used for various purposes; of several kinds and properties.

Dr. Lister, in the *Philosophical Transactions*, gives us a table of twenty-two several *Clays* found in the several counties of England; five whereof he calls

Pure, i. e. such as are soft, like butter, to the teeth, with little or no gritty earth in them, viz. 1. Fullers earth, which he distinguishes by its colour into yellowish, brown, and white: See **FULLERS Earth**. 2. Boles. See **BOLE**. 3. Pale yellow Clay. 4. Cowshot Clay. 5. Dark blue Clay, or marle. See **MARLE**. —The other seventeen,

Impure; whereof eight are harsh and dusty when dry: as, 1. Creta, chalk, or milk-white Clay. 2. Potters pale yellow Clay. 3. Blue potters Clay. 4. Blue Clay, wherein is found the astroitea. 5. Yellow Clay. 6. Fine red Clay. 7. Soft chalky blue Clay. 8. Soft chalky red Clay.

Three are stony when dry, viz. 1. A red stony Clay. 2. A blue stony Clay. 3. A white stony Clay.

Three are mixed with sand, or pebbles, viz. 1. A yellow loam. 2. A red sandy Clay. 3. A second species of the same kind.

Lastly, three are mixed with flat or thin sand, glittering with mica: viz. 1. Crouch white Clay. 2. Grey or bluish tobacco-pipe Clay. 3. A red Clay. But this is a very unartful disposition. See **Supplement**, article **ARGILLA**.

CLAYES, in fortification, are wattles made with stakes, interwove with osiers, &c. to cover lodgments.

CLAYING of Lond. See **MANURING**.

CLEAR, in building, is sometimes used among the workmen for the inside work of a house, &c.

CLEAR Idea, or *Notion*. See the articles **NOTION**, and **IDEA**.

CLEARING of Liquors. See **CLARIFICATION**.

CLECHE *, or **CLACHY**, in heraldry, is explained by Guillim as an ordinary open to the light, or pierced through with another inner one of the same figure; a *gr.* when a cross appears as if charged with another cross of the same colour with the field; or as if the field appeared through the apertures thereof.

* The word is French, supposed to be formed of *clef*, key; the ends of the cross being thought to bear some resemblance to the bowls of the ancient keys.

But Colombiere, and some other writers, will have this piercing to be only a circumstance of the cross *Clechi*, and call it by the name *vide*, voided. The thing that denominates it *Clechi*, is its spreading from the centre towards the extremities, which are very wide, and end in an angle in the middle; as in the figure represented Tab. *Herold*. fig. 37.

CLEDONISM, CLEDONISME, a kind of divination in use among the ancients.

The word is formed from the Greek *κλεδονισμος*, which signifies two things, *rumor*, a report, and *avis*, a bird: In the first sense, *Cledonism* should denote a kind of divination drawn from words occasionally uttered.—Cicero observes, that the Pythagoreans made observation not only of the words of the Gods, but of those of men; and accordingly believed the pronouncing of certain words, *v. gr.* *incendium*, at a meal, very unhappy.—Thus, instead of prison, they used the word *domicilium*; and to avoid *crimines*, said *sumenides*.

In the second sense, *CLEDONISM* should mean a divination drawn from birds; the same with *ornithomania*.

CLEF, or CLIFF, in music, a mark at the beginning of the lines of a song, which shews the tone, or key in which the piece is to begin.—Or, it is a letter marked on any line, which explains and gives the name to all the rest.

Antiently, every line had a letter marked for a *Clef*: now a letter on one line suffices; since by this all the rest are known; reckoning up and down in the order of the letters.

It is called the *Clef*, *q. d.* key, because hereby we know the names of all the other lines and spaces; and consequently the quantity of every degree, or interval.

But because every note in the octave is called a *key*, though in another sense, this letter marked, is called in a particular manner the *signed Clef*; because being written on any line, it not only signs and marks that one, but it also explains all the rest. By *Clef*, therefore, for distinction-sake, we mean that letter signed on a line, which explains the rest; and by *key* the principal note of a song, in which the melody closes.

There are three of these *signed Clefs*, *c, f, g*. The *Clef* of the highest part in a song, called *treble*, or *alt*, is *f* set on the second line counting upwards. The *Clef* of the bass, or the lowest part, is *f* on the fourth line upwards: for all the other mean parts, the *Clef* is *c*, sometimes on one, sometimes on another line. Indeed, some that are really mean parts, are sometimes set with the *g Clef*.

It must, however, be observed, that the ordinary signature of *Clef*s bear little resemblance to those letters. Mr. Malcolme thinks it would be well if we used the letters themselves. Kepler takes a world of pains, to shew that the common signatures are only corruptions of the letters they represent. See their figure among the other **CHARACTERS of music**.

The *Clef*s are always taken fifth to one another: that is, the *Clef* *f* is lowest, *c* a fifth above it, and *g* a fifth above *c*.

When the place of the *Clef* is changed, which is not frequent in the mean *Clef*, it is with design to make the system comprehend as many notes of the long as possible, and so to have the fewer notes above or below it. If then there be many lines above the *Clef*, and few below it, this purpose is answered by placing the *Clef* in the first or second line: if there be many notes below the *Clef*, it is placed lower in the system. In effect, according to the relation of the other notes to the *Clef* note, the particular system is taken differently in the scale, the *Clef* line making one in all the variety.

But still, in whatever line of the particular system any *Clef* is found, it must be understood to belong to the same of the general system, and to be the same individual note or found in the scale. By this constant relation of *Clef*s, we learn how to compare the several particular systems of the several parts; and know how they communicate in the scale, *i. e.* which lines are unison, and which not: for it is not to be supposed that each part has certain bounds, within which another must never come. Some notes of the treble, *v. gr.* may be lower than some of the mean parts, or even of the bass. To put together therefore in one system all the parts of a composition written separately, the notes of each part must be placed at the same distances above and below the proper *Clef*, as they stand in the separate system; and because all the notes that are consonant, (or heard together) must stand perpendicularly over each other, that the notes belonging to each part may be distinctly known, they may be made with such differences as shall not confound or alter their significations with respect to time, but only shew that they belong to this or that part. Thus shall we see how the parts change and pass through one another; and which, in every note is highest, lowest, or unison. The use of particular *signed Clefs* then, is an improvement with respect to the parts of any composition; for unless some one key in the particular systems were distinguished from the rest, and referred invariably to one place in the scale, the relations could not be distinctly marked.

It must here be observed, that for the performance of any single piece, the *Clef* only serves for explaining the intervals in the lines and spaces: so that we need not regard what part of any greater system it is; but the first note may be taken as high or

as low as we please. For as the proper use of the scale is not to limit the absolute degree of tone; so the proper use of the *signed Clef*, is not to limit the pitch at which the first note of any part is to be taken; but to determine the tune of the rest, with relation to the first: and considering all the parts together, to determine the relations of their several notes by the relations of their *Clef*s in the scale: thus, their pitch of tune being determined in a certain note of one part; the other notes of that part are determined by the constant relations of the letters of the scale, and the notes of the other parts by the relations of their *Clef*s.

In effect, for performing any single part, the *Clef* note may be taken in any octave, *i. e.* at any note of the same name, provided we do not go too high or too low for finding the rest of the notes of a song. But in a concert of several parts, all the *Clef*s must be taken, not only in the relations, but also in the places of the system abovementioned; that every part may be comprehended in it.

The difference of *Clef*s in particular systems, makes the practice of music much more difficult and perplexed than it would otherwise be; both with respect to instruments, and to the voice. This occasioned Mr. Salmon to propose a method of reducing all music to one *Clef*; whereby the same writing of any piece of music, should equally serve to direct the voice, and all instruments; which he calls an *universal character*.

The natural and artificial note expressed by the same letter, as *c*

and *c* , are both set on the same line or space. When there

is no character of flat or sharp at the beginning with the *Clef*, all the notes are natural: and if in any particular place the artificial note be required, it is signified by the sign of a flat or sharp set on the line a space before that note.

If a sharp or flat be set at the beginning in any line or space with the *Clef*, all the notes on that line or space are artificial ones; *i. e.* are to be taken a semitone higher or lower than they would be without such sign. And the same affects all their octaves above and below, though they be not marked so. In the course of the song, if the natural note be sometimes required, it is signified by this character.

The marking of the system thus by flats and sharps, Mr. Malcolme calls the *signature of the Clefs*.

CLEFT, in grafting. See the article **ENGRAFTING**.

CLEMENTINE*, a term in use among the Augustines, who apply it to a person, who after having been nine years a superior, ceases to be so, and becomes a private monk, under the command of a superior.

* The word has its rise hence, that pope Clement, by a bull, prohibited any superior among the Augustines from continuing above nine years in his office.

CLEMENTINES, in the canon law, are the constitutions of pope Clement V. and the canons of the council of Vienne. See **CANON**.

CLENCH-NAILS. See the article **NAILS**.

CLEPSYDRA*, a kind of water-clock, or an hour-glass serving to measure time by the fall of a certain quantity of water.

* The word comes from *κλεψω*, *condo*, and *δρα*, *agua*, water.

There have likewise been *Clepsydræ* made with mercury.

The Egyptians, by this machine, measured the course of the sun; Tycho Brahe, in our days, made use of it to measure the motion of the stars, &c. and Dudley used the same contrivance in making all his maritime observations.

The use of *Clepsydræ* is very antient: they were invented in Egypt under the Ptolemys; as were also sun-dials.—Their use was chiefly in the winter; sun-dials served in the summer. They had two great defects; the one, that the water run out with a greater or less facility, as the air was more or less dense: the other, that the water run out more readily at the beginning, than towards the conclusion.

M. Anontons has invented a *Clepsydra* free from both these inconveniences, and which has the three grand advantages, of serving the ordinary purpose of clocks; of serving in navigation for the discovery of the longitude; and of measuring the motion of the arteries.

Construction of a CLEPSYDRA.—To divide any cylindric vessel into parts to be emptied in each division of time; the time wherein the whole, and that wherein any part is to be evacuated, being given.

Suppose, *v. gr.* a cylindric vessel, whose charge of water flows out in twelve hours, were required to be divided into parts to be evacuated each hour. 1. As the part of time 1 is to the whole time 12, so is the same time 12 to a fourth proportional, 144. 2. Divide the altitude of the vessel into 144 equal parts: here, the last will fall to the last hour; the three next above to the last part but one; the five next to the tenth hour, &c. Lastly, the 23 last to the first hour.

For, since the times increase in the series of the natural numbers 1 2 3 4 5, &c. and the altitudes, if the enumeration be in retrograde order from the twelfth hour, increase in the series of the unequal numbers 1 3 5 7 9, &c. the altitudes computed from the twelfth hour, will be as the squares of the times 1 4 9 16

25, &c. Therefore the square of the whole time 144, comprehends all the parts of the altitude of the vessel to be evacuated. But a third proportional to 1 and 12 is the square of 12; and consequently it is the number of equal parts into which the altitude is to be divided, to be distributed according to the series of the unequal numbers, through the equal intervals of hours. Since, in lieu of parts of the same vessel, other less vessels equal thereto may be substituted; the altitude of a vessel emptied in a given space of time being given, the altitude of another vessel to be emptied in a given time may be found; viz. by making the altitudes as the squares of the times.

Hence we see the method of constructing the *Clepsydra* used by the antients.

CLEPSYDRA is also used for an hour-glass of sand. See **Hour-glass**.

CLERGY, **CLERUS**, *κλῆρος*, the assembly or body of clerks, or ecclesiastics. See **CLERK**.

In the Romish church there are two kinds of *Clergy*: the one regular, comprehending all the religious of both sexes: the other secular, comprehending all the ecclesiastics that do not make the monastic vows.

Among the reformed, there are none but secular *Clergy*.—The Roman *Clergy* forms a monarchical state, under the pope, who is the head thereof.

The *Clergy* was antiently divided into three orders, viz. priests, deacons, and inferior clerks; and each order had its chief: the arch-priest was the head of the first order, the archdeacon of the second, and the dean of the third.

Under the name of *Clergy*, were also formerly comprised all the officers of justice; as being supposed to be men of letters. See **CLERK**.

Though the *Clergy* formerly claimed an exemption from all secular jurisdiction, yet Matt. Paris tells us, William the conqueror subjected the bishops and abbays who held per Baroniam, and who, till then, had been exempt from all secular service; and ordered they should be no longer free from mortuary services. To this purpose he prescribed arbitrarily what number of soldiers every abbey and bishoprick should provide, to serve him and his successors in war, and laid up these registers of ecclesiastical servitude in his treasury.

But, in effect, the *Clergy* were not exempt from all secular service till then; as being bound by the laws of king Edgar to obey the secular magistrate in some things, viz. upon an expedition to the wars, and in contributing to the building, and repairing of bridges, &c. See **TRINODA NECESSITAS**.

The *Privileges of the English Clergy*, by the antient statutes, are very considerable: their goods are to pay no toll in fairs or markets; they are exempt from all offices, but their own; from the king's carriages, posts, &c. from appearing at sheriffs' tours or frank-pledges; and are not to be fined or amerced, according to their spiritual, but their temporal means.

A *Clergyman* acknowledging a statute, his body is not to be imprisoned: if he be convicted of a crime, for which the benefit of *Clergy* is allowed, he shall not be burnt in the hand; and he shall have the benefit of the *Clergy* in infinitum, which no layman can have but once.

The *Clergy*, by common law, are not to be burdened in the general charges with the laity; nor to be troubled or incumbered, unless expressly named, and charged by the statute; for general words do not affect them. Thus, if a hundred be sued for a robbery, the minister shall not contribute; though the words are, *gentes demorantes*: neither are they assessed to the highway, to the watch, &c.

The *Revenues of the Clergy*, were antiently more considerable than at present: Ethelwolph, in 855, gave them the tythe of all goods, and the tenth of all the lands in England; free from all secular services, taxes, &c.

The charter whereby this was given them, was confirmed by several of his successors, Edmund, Edgar, Ethelred, Alfred, and William the conqueror; which last, finding the bishopricks so rich, erected them all into baronies; each barony containing thirteen knights fees, at least.—But since the reformation the bishopricks are much impaired. See **BISHOP**.

The revenues of the inferior *Clergy*, in the general, are small; a third part of the best benefices being antiently, by the pope's grant appropriated to monasteries; upon the dissolution whereof they became lay-fee.

Indeed an addition was made 2^d Annæ; the whole revenue of first-fruits and tenths being then granted, to raise a fund for the augmentation of the maintenance of the poor *Clergy*: pursuant to which, a corporation was formed, by the name of the governors of the bounty of queen Anne, for the augmentation of the maintenance of the poor *Clergy*; to whom the said revenues were conveyed in trust, &c. See **FIRST-FRUIT**.

Articles of the Clergy. See **ARTICLES**.

Proctors of the Clergy. See the article **PROCTORS**.

CLERGY is also used for an antient liberty of the church, confirmed by several acts of parliament; consisting in this, that when a priest, or one in orders, is arraigned of felony before a secular judge, he may pray his *Clergy*, i. e. he may pray to be delivered

ed to his ordinary, to purge himself of the crime objected against him.—This was formerly admitted, even in cases of murder.—But the antient course of the law is now much altered on this head.—By the statute 18 Eliz. cap. 7. clerks are no more committed to their ordinaries to be purged; but every man to whom the benefit of *Clergy* is granted, though not in orders, is put to read at the bar, after he is found guilty, and convicted of such felony; and so, burnt in the hand, and set free for the first time; if the ordinary's commissioner, or deputy standing by, do say, *legit ut clericus*; otherwise he suffers death.

CLERICAL Crown. See the article **CROWN**.

CLERICAL Title. See the article **TITLE**.

CLERICI non elegantur in officio. See **QUOD CLERICI**.

Non-residentia pro CLERICIS Regis. See **Non RESIDENTIA**.

CLERICO admittendo, a writ directed to the bishop, for the admitting a clerk to a benefice upon a ne admittas tried, and found for the party who procured the writ. See the article **ADMITTENDO**.

CLERICO capto per statum mercatorum, is a writ for the delivery of a clerk out of prison, who is imprisoned upon the breach of statute-merchant.

CLERICO convicto commissis gaule in defectu ordinarii deliberando, is a writ for the delivery of a clerk to his ordinary, that was formerly convicted of felony; by reason his ordinary did not challenge him according to the privilege of clerks.

CLERICO intra sacros ordines constituto non eligendo in officium, is a writ directed to the bailiffs, &c. that have thrust a bailiwick or beadlehip upon one in holy orders; charging them to release him.

CLERK*, **CLERICUS**, a word formerly used to signify a learned man, or man of letters.

* The word comes from the Greek *κλῆρος*, used for *clergy*, but more properly signifying *lot*, or *heritage*; in regard the lot, and portion of Clerks or ecclesiastics is to serve God.—Accordingly, *clerus* was at first used to signify those, who had a particular Attachment to the service of God.—The origin of the expression is derived from the old testament, where the tribe of Levi is called the *lot*, *heritage*, *κλῆρος*; and God is reciprocally called their portion; by reason that tribe was consecrated to the service of God, and lived on the offerings made to God, without any other settled provision as the rest had.

Thus, Pasquier observes, the officers of the counts, (*comites*) were antiently created under the title of *Clerks of Accounts*; and secretaries of state were called *Clerks of the Secret*. So, *Clericus domini regis*, in the time of Edward I. was englisht, the king's secretary, or Clerk of his council.

The term was applied indifferently to all who made any profession of learning; or who knew how to manage the pen: though, originally it was appropriated to ecclesiastics.

As the nobility and gentry were usually brought up to the exercise of arms; there was none but the clergy left to cultivate the sciences: hence, as it was the clergy alone who made any profession of letters, a very learned man came to be called a great Clerk, and a stupid ignorant man, a bad clerk.

Ronsard, in his old language, uses the word femininely, *clergesse*, for a learned woman. "Mais trop plus est à craindre une femme 'clergesse'."

CLERK (in the general) is used for all those of the ecclesiastical state, or who are in holy orders, of any degree, or kind; from the deacon, to the prelate.

Yet, in its utmost latitude, the word *Clerk* also includes *chantors*, *acolythi*, *exorcists*, and *psalmists*. See **CHANTOR**, **ACOLYTHI**, **EXORCIST**, &c.

The canons excommunicate all those who lay hands on a Clerk. A council held in Africa prohibited the appointing any Clerk to be a tutor, guardian, or curator, by testament.—The council of Elvira enjoins continence on all clerks, bishops, priests, or deacons, on pain of being stripped of their clerical state.

Accephalus CLERK, in the sixth century, was a name given to those Clerks who separated from the bishop, and chose not to live any longer in community with him; in contradistinction to **Canonic CLERKS**, who continued to live with the bishop, according to the canons.

CLERK, is also a title given to several officers in the royal palace, the courts of justice, revenue, army, navy, &c.—The principal of these are as follow.

CLERK of the Acts, is an officer of the navy, who receives and enters the commissions and warrants of the lord admiral; and registers the acts and ordinances of the commissioners of the navy.

CLERK of Assize, is he that writeth all things judicially done by the justices of assize, in their circuits.

CLERK of the Check, is an officer in the court, so called, because he hath the check and controulment of the yeomen of the guard, and all other ordinary yeomen, or others, belonging either to the king, queen, or prince; giving leave, or allowing their absence, or defects in attendance; or diminishing their wages for the same.

CLERK of the Closet, is a divine, otherwise called *confessor* to his majesty; whose office is to attend at the king's right hand during divine

divise service, to resolve all doubts concerning spiritual matters, to wait on the king in his private oratory, &c.

CLERK of the Crown, or Crown-Office, in the King's-bench court, an officer whose business is to read, frame, and record all indictments against traitors, felons, and other offenders there arraigned upon any publick crime.

CLERK of the Crown, in Chancery, is an officer, who by himself, or deputy, is continually to attend the lord chancellor, or lord keeper, for special matters of state, by commission, or the like, either immediately from his majesty, or by order of his council; as well ordinary as extraordinary.—All general pardons, upon grants of them at the king's coronation, or in parliament; the writs of parliament, with the names of the knights, citizens, and burgesses, are also returned into his office: besides which, he has the making of special pardons, and writs of execution upon bonds of statute staple forfeited.

CLERK of the Deliveries, is an officer in the Tower, who takes indentures for all stores issued thence.

CLERK of the Enrollments of Fines and Recoveries, in the court of Common-pleas, is an officer under the three elder judges of that court, and removable at their pleasure. See **ENROLLMENT**.

CLERK of the Errors, in the Court of Common-pleas, transcribes and certifies into the king's-bench the tenor of the records of the cause, or action, upon which the writ of error, made by the curitor, is brought there to be determined.

CLERK of the Errors, in the King's-bench, transcribes and certifies the records of such causes in that court into the exchequer; if the cause, or action, is by bill.

CLERK of the Errors, in the Exchequer, transcribes the records certified thither out of the king's-bench; and prepares them for judgment in the court of exchequer, to be given by the justices of the common-pleas, and barons, there.

CLERK of the Effoins, in the court of common-pleas, keeps the effoin-roll, or enters effoins. He also provides parchment, cuts it into rolls, marks the number on them; delivers out all the rolls to every officer, and receives them again when written. See **ESSOIN**.

CLERK of the Estraits, belongs to the exchequer; and, every term, receives the estraits out of the lord treasurer's remembrancer's office, and writeth them out to be levied for the king. He also maketh schedules of such sums estraits as are to be discharged. See **ESTREAT**.

CLERKS of the Green Cloth. See **GREEN-CLOTH**.

CLERK of the Hammer, or Hammerer, is an officer in chancery, whose business is to receive all money due to the king for the seals of charters, patents, commissions, and writs: as also fees due to the officers for enrolling and examining the same. He is obliged to attend on the lord chancellor, or lord keeper, daily in term-time; and at all times of fealing.

CLERK of the juries, or curata writs, is an officer belonging to the court of common-pleas, who makes out the writs called *habeas corpus*, and *distringas*, for the appearance of juries, either in court or at the assizes; after the panel is returned upon the venire facias. See **JURY**.

CLERK Comptroller of the King's House, an officer of the court, who has place and seat in the compting-house; with authority to allow or disallow the charges and demands of purveyants, and messengers of the green-cloth, purveyors, &c. He has also the oversight of all defaults and miscarriages of inferior officers; and sits in the compting-house with the superior officers, viz. the lord steward, treasurer, comptroller, and officer, for the correcting and redressing things out of order.

CLERK of the King's great Wardrobe, keeps an account or inventory in writing, of all things belonging to the king's wardrobe. See **WARDROBE**.

CLERK of the King's Silver, is an officer belonging to the common-pleas; to whom every fine is brought, after it has been with the custos brevium; and by whom the effect of the writ of covenant is entered into a paper-book; and according to that note, all the fines of that term are also recorded in the rolls of the court. See **QUEEN Gold**.

CLERK of the Market, is an officer of the king's house, whose duty is to take charge of the king's measures, and to keep the standards of them, that is, examples of all the measures that ought to be used through the land.

CLERK Marshal of the king's house, seems to be an officer who attends the marshal in his court, and records all his proceedings. See **MARSHAL**.

CLERK of a Ship, is an officer appointed to take care that nothing be squandered, or spent needlessly. He is obliged to keep a register, or journal, containing an exact inventory of every thing in the loading of the vessel; as the rigging, apparel, arms, provision, munition, merchandises: as also the names of the passengers, if there be any; the freight agreed on; a list of the crew, their age, quality, wages; the bargains, purchases, sales, or exchanges the ship makes from its departure; the consumption of provision; and, in short, every thing relating to the expence of the voyage. He also registers the consultations of the captains, pilots, &c.—He also does the office of a register in all criminal processes; and of a notary, to make and

keep the wills of those who die in the voyage; takes inventories of their effects, &c. The Clerk is not allowed to quit the vessel during the voyage, on forfeiture of all his wages, &c.—In small vessels, the master, or pilot, does the office of Clerk.

CLERK of the Nichils, or Nichils, is an officer in the exchequer, who makes a roll of all such sums as are nichilled by the sheriffs upon their estraits of green wax; and delivers the same into the lord treasurer's remembrancer's office, to have execution done upon them for the king. See **NIHIL**.

CLERK of the Ordinance, is an officer in the Tower, who registers all orders relating to the king's ordinance. See **ORDNANCE**.

CLERK of the Outlawries, is an officer belonging to the court of common-pleas; being a deputy to the king's attorney-general, for making out the writs of *capias utlagatum*, after outlawry; and the king's attorney's name is to every one of those writs.

CLERK of the Paper-Office, is an officer of the king's-bench. See **PAPER-Office**.

CLERK of the Parcels, an officer of the exchequer. See **PARCEL-Makers**.

CLERK of the Parliament, is an officer who records all things done in parliament; and engrosses them fairly into parchment rolls, for their better keeping to posterity.—Of these there are two: one of the higher, or house of lords; and the other of the lower, or house of commons.

CLERK of the Patents, or letters patent under the great seal. See **PATENT**.

CLERK of the Peace, is an officer belonging to the session of the peace, whose duty is at the session to read the indictments, to enroll the acts, and draw the process; to enroll proclamations of rates for servants wages; to enroll the discharge of apprentices; to keep the counterpart of the indenture of armour, &c. Also to certify in the king's-bench transcripts of indictments, outlawries, attainders, and convictions, had before the justices of the peace within the time limited by statute.

CLERK of the Pells, belongs to the exchequer: his business is, to enter the teller's bills into a parchment roll, called *pellis receptorum*; and also to make another roll of payment, called *pellis exituum*, wherein he sets down by what warrant the money was paid. 22 and 23 Car. 2.

CLERK of the Petty Bag, is an officer in chancery, whereof there are three; the master of the rolls being their chief.—Their office is to record the return of all inquisitions out of every county, all liveries granted in the court of wards, all offer les maines; to make all patents of customers, gaugers, comptrollers, and aulnagers; to conge d'elires for the creations of bishops; summons of the nobility, clergy, and burgesses to parliament; commissions directed to knights and others, of every shire, for raising of subsidies; writs for nomination of collectors for the fifteenth; and all traverses upon any office, bill, or otherwise; and to receive the money due to the king for the same.

CLERK of the Pipe, belongs to the exchequer; who having all accounts and debts due to the king delivered and drawn out of the remembrancer's office, chargeth them down into the great roll: he also writes summons to the sheriff, to levy the said debts upon the goods and chattels of the said debtors; and if there be no goods, he draws them down to the lord treasurer's remembrancer, to write estraits against their lands.

CLERK of the Pleas, is an officer in the exchequer; in whose office the officers of the court, upon special privileges belonging to them, ought to sue, and be sued upon any action.

CLERKS of the Privy Seal, are four officers, who attend the lord keeper of the privy-seal, or, if there be none such, the principal secretary; and write, or make out all things sent by warrant from the signet to the privy-seal, and to be passed to the great-seal: as also to make out privy-seals upon any special occasion of the king's affairs; as for loan of money, or the like.

CLERK of the Sewers, is an officer belonging to the commissioners of the sewers, who writes down all things they do by virtue of their commission, and the authority given them by 13 El. c. 9.

CLERK of the Signet, is an officer continually attending on the king's principal secretary; who has custody of the privy-signet, as well for sealing the king's private letters, as for such grants as pass his majesty's hand by bills signed. Of these there are four, who attend in their turn, and have their diet at the secretary's table.

CLERK of the Superfedeas, is an officer of the court of common-pleas, who makes out writs of *Superfedeas* (upon the defendant's appearing to the exigent on an outlawry) whereby the sheriff is forbid to return the exigent.

CLERK of the Treasury, an officer of the common-pleas, who has charge of the records of the nisi prius, the fees due for all searches, and the certifying of all records into the king's-bench, when a writ of error is brought.—He also makes out all writs of *superfedeas de non molestanda*, which are granted for the defendants while the writ of error hangeth; and all exemplifications of records, being in the treasury.

CLERK of the Warrants, is an officer likewise belonging to the court of common-pleas, who enters all warrants of attorney for

plaintiff and defendant; and enrolls all deeds of indentures of bargain and sale, which are acknowledged in the court, or before any judges out of the court. And it is his office to estreat into the exchequer all issues, fines, and amerciaments, which grow due to the king in that court, for which he has a standing fee or allowance.

Misprison of CLERKS. See the article MISPRISON.

Riding CLERK. See the article RIDING.

Six CLERKS. See the article SIX.

CLEROMANCY *, a kind of divination performed by the throwing of dice, or little bones; and observing the points, or marks turned up.

* The word comes from the Greek κληρῶν, *lot*, and μαντεία, *divination*.

At Bura, a city of Achaia, was a temple, and a celebrated oracle of Hercules; where such as consulted the oracle, after praying to the idol, threw four dies, the points whereof being well scanned by the priest, he was supposed to draw an answer from them.

CLERUS. See CLERK.

CLIENT, CLIENTS, among the Romans, a citizen who put himself under the protection of some great man, who in that relation was called his patron, *patronus*.

The patron assisted his *Client* with his protection, interest and estate; and the *Client* gave his vote for his patron, when he sought any office for himself, or his friends. *Clients* owed respect to their patrons, as these reciprocally owed them their protection.

This right of patronage was appointed by Romulus, to unite the rich and poor together, in such manner, as that one might live without contempt, and the other without envy. But the condition of a *Client*, in course of time, became little else but a moderate kind of slavery.

By degrees, the custom extended itself beyond Rome; and not only families, but cities, and entire provinces, even out of Italy, followed the example. Thus Sicily, *v. gr.* put itself under the clientela, or protection of Marcellus.

Lazius and Budeus, refer the origin of fiefs, and tenures, to the patrons and *Clients* of ancient Rome: but the difference is pretty considerable between the relation of vassals and their lords, and that of *Clients* and their patrons. See VASSAL.

The *Clients*, beside the respect they bore their patrons, and the vote they gave them, were obliged to assist them in all affairs; and even to pay their ransom, if they should be taken prisoners in war, in case they were not able to do it themselves.

CLIENT, is now used for a party in a law-suit, who has turned over his cause into the hands of a counsellor, or solicitor.

CLIMACTERIC *, *Annus CLIMACTERICUS*, a critical year, or period in a man's age, wherein, according to astrologers, there is some very notable alteration in the body to arise; and a person stands in great danger of death.

* The word comes from the Greek κλιμακτηρ, or κλιμακτηριχῶν, of κλιμαξ, *κλιμακῶν*, *scala*; *q. d.* by a scale, or ladder.

The first *Climacteric* is the seventh year of a man's life; the rest are multiples of the first, as 21, 49, 56, 63, and 84; which two last are called the *Grand Climacterics*, and the dangers here are supposed more imminent.

The opinion has a great deal of antiquity on its side. Aulus Gellius says, it was borrowed from the Chaldeans; who might probably receive it from Pythagoras, whose philosophy turned much on numbers; and who imagined an extraordinary virtue in the number 7.

Marc. Ficinus gives us the foundation of the opinion: he tells us, there is a year assigned for each planet to rule over the body of man, each in his turn: now Saturn being the most malignant planet of all, every seventh year, which falls to his lot, becomes very dangerous; especially those of 63 and 84, when the person is already advanced in years.

Some hold, according to this doctrine, every seventh year an established *Climacteric*; but others only allow the title to those produced by the multiplication of the climacterical space by an

odd number, 3, 5, 7, 9, &c.—Others observe every ninth year as a *Climacteric*.

Hevelius has a volume under the title of *annus climactericus*, describing the loss he sustained in the burning of his observatory, &c. which it seems happened in his first *Grand Climacteric*.

Suetonius says, Augustus congratulated his nephew upon his having passed his first *Grand Climacteric*, whereof he was very apprehensive.

Some pretend that the *Climacteric* years are also fatal to political bodies; which perhaps may be granted, when it is proved that they are so to natural ones.

Authors on this subject, are Plato, Cicero, Macrobius, Aulus Gellius, among the antients; Argol, Magirus, and Salmatius, among the moderns. And St. Augustin, St. Ambrose, Beda, and Boetius countenance the opinion.

CLIMATE *, **CLIMA**, or **CLIME**, in geography, a part of the Surface of the earth, bounded by two circles parallel to the equator, and of such a breadth, as that the longest day in the parallel nearer the pole, exceeds the longest day in that next the equator by some certain space; *viz.* half an hour.

* The word comes from the Greek κλίμα, *inclinationum*, an inclination.

The *Beginning of the CLIMATE*, is the parallel circle wherein the day is the shortest.

The *End of the CLIMATE*, is that wherein the day is the longest.

The *Climates* therefore are reckoned from the equator to the pole; and are so many bands, or zones terminated by lines parallel to the equator: though, in strictness, there are several *Climates* in the breadth of one zone.

Each *Climate* only differs from its contiguous ones, in that the longest day in summer is longer or shorter by half an hour in the one place than in the other.

As the *Climates* commence from the equator, the first *Climate*, at its beginning, has its longest day precisely twelve hours long; at its end, twelve hours and an half: the second, which begins where the first ends, *viz.* at twelve hours and an half, ends at thirteen hours; and so of the rest, as far as the polar circles, where, what the geographers call *Hour-Climates* terminate, and *Month-Climates* commence.

As an *Hour-Climate* is a space comprized between two parallels of the equator, in the first of which, the longest day exceeds that in the latter by half an hour; so the *Month-Climate* is a space terminated between two circles parallel to the polar circles, whose longest day is longer or shorter than that of its contiguous one by a month, or thirty days.

The antients, who confined the *Climates* to what they imagined the habitable parts of the earth, only allowed of seven. The first they made to pass through Merce; the second through Sienna; the third through Alexandria; the fourth through Rhodes; the fifth through Rome; the sixth through Pontus; and the seventh through the mouth of the Borythenes.

The moderns, who have sailed further toward the poles; make thirty *Climates* on each side: and in regard the obliquity of the sphere makes a little difference in the length of the longest day; instead of half an hour, some of them only make the difference of *Climates* a quarter.

In fixing the *Climates*, there ordinarily is no regard had to the refraction.

Vulgarly, the term *CLIMATE* is bestowed on any country or region differing from another, either in respect of the seasons, the quality of the soil, or even the manners of the inhabitants: without any regard to the length of the longest day.

Abulfeda, an Arabic author, distinguishes the first kind of *Climates* by the term *real Climates*; and the latter by that of *apparent Climates*.

Varenus gives us a table of thirty *Climates*; but without any regard to the refraction. Riccioli furnishes a more accurate one, wherein the refractions are allowed for: an abstract of which follows.

A Table of CLIMATES.

Middle of Chm.	Longest Day.	Latit.	Climates.	Longest Day.	Latit.	Middle of Chm.	Latit.	Cont. Light.	North Night.	Cont. Light.	South Night.

CLIMAX, *Κλίμαξ*, or *Gradation*, in rhetoric, a figure, whereby the discourse ascends, or descends, as it were by degrees. Such is that of Cicero to Cataline, *Nihil agis, nihil moliris, nihil cogitas; quod ego non audiam, quod etiam non videam, planeque sentiam: thou dost nothing, movest nothing, thinkest nothing; but I hear it, may see it, and perfectly understand it.* Thus, the same *CL-*

cero to Atticus; *Si dormis, experscere; si stas, ingredere; si ingrederis, curare; si curris, adula.* So, Tertullian de *Specl.* 'Who ever found the truth without God? Who ever found God without Christ? Who Christ without the Holy Spirit? Who the Holy Spirit without Faith?'

CLO

CLINIC, CLINICUS *, a term applied by some church-historians to those among the antients, who received baptism on their death-bed.

* The word is Greek, *κλινικ* Θ , formed from *κλιν*, a bed.

It was the doctrine of many of the fathers, that baptism absolutely washed away all previous sins, and that there was no atonement for sins committed after baptism. On this account, many deferred that sacrament till they were arrived at the last stage of life, and were pretty safe from the danger of sinning any more, and such were called *Clinici*.

Magnus, in the third century, made a doubt whether or no *Clinici* were truly baptized, in regard the ceremony was only performed by aspersion, instead of immersion! he consulted St. Chrysostom on the point, who made him answer, that the sacrament does not wash away sin after the manner of a corporal bath; and shews from scripture that aspersion is sufficient.

CLINIC is also used in antiquity for a patient, or person merely sick, even without keeping his bed.—As appears from the life of Charlemagne, in Canisius.

CLINICUS is also used for a physician.—In regard, physicians are much conversant about the beds of the sick.

It was, however, principally the physicians of emperors that were called by this title.

CLINIC is now seldom used but for a quack; or rather for an empirical nurse, who pretends to have learned the art of curing diseases by attending on the sick.

Medicina CLINICA, was particularly used for the method of visiting, and treating sick persons in bed, for the more exact discovery of all the symptoms of their disease.

Le Clerc observes, that Esculapius was the first who exercised the *Clinic medicine*.

CLINOIDES *, in anatomy, an epithet given to three internal apophyses of the os sphenoides, one of the bones of the cranium; so called, say some, from their resembling the feet of a bed. See **SPHENOIDES**.

* The word is formed of the Greek *κλιν*, a bed, and *ειδ* Θ , form; either from the resemblance which the three bones bear to the feet of a bed; or from the cavity they form, which resembles a bed itself.

Two of these are anterior, or before; the third posterior, behind: the three together form a little cavity, from its shape called *fella turcia*, or *equina*; wherein is placed the pituitary gland.

CLITORIDIS Musculi, in anatomy. See **RECTOR Clitoridis**.

CLITORIS, *Κλειτορις*, in anatomy, a long round body in the fore-part of the vulva, or natural parts of a woman; being one of the organs of generation in that sex.—See **Tab. Anat.** (Splanch.) fig. 9. lit. o. p. fig. 11. lit. m. fig. 13. lit. a.

Its figure represents that of a gians or acorn: ordinary it is pretty small, but in some women thick, and long.—In many respects, it represents the penis of a man; whence some call it *mentula*, or *penis muliebris*, the woman's yard.

In effect, it is composed of the same parts; it has, like it, two cavernous or spongy bodies; and a glands at the extremity, covered with a præputium; but it is not pierced through like the penis.

It has two muscles which erect it in coition; on which occasion it swells, and grows hard. Some anatomists pretend too, that it has two muscular ejaculators.—See **Tab. Anat.** (Splanch.) fig. 13. lit. f. f.

Its sensation is exquisite; and it is found the chief seat of pleasure; so that some call it *æstrum veneris*. And hence it is said, some women are apt to abuse it. See **POLLUTION**.

The extremity of this part is sometimes cut off; as in circumcision, and where it advances out too far. It is sometimes so large and propendent, that it bears a full resemblance to the virile member; whence the persons in whom it is so found, frequently pass for hermaphrodites.

The spongy bodies of the *Clitoris*, arise distinctly from the lower parts of the os pubis; and approaching one another, unite, and form the body of the *Clitoris*. Before their union they are called the *crura clitoridis*; and are twice as long as the body of the *Clitoris*.

Its muscles arise from the protuberance of the ischium, and are inserted into its spongy bodies. It has veins and arteries from the hæmorrhoidal vessels, and pudenda; and nerves from the intercostals.

CLOACA *, among the antients, was a subterraneous aqueduct, or common-fluore, for the reception and discharge of the filth of a city, or house.

* The word is formed from the Greek *κλωα*, I wash away.

Tarquinius Priscus is said to have been the first who contrived *Cloacæ* in antient Rome; to which end, a canal was first dug through the mountains whereon the city stood, and divided into three branches, called the *great Cloaca*.

The care and inspection of the *Cloacæ* belonged to the censors, till the time of Augustus, who appointed curatores *Cloacarum* on purpose.—The Romans had also their *Cloacina*, or goddess, who presided over the *Cloacæ*.

CLO

CLOATHS, or **CLOTHES**. See the article **HABIT**.

CLOCK, a kind of movement, or machine, serving to measure, and strike time.

The usual chronometers are watches, and *clocks*: the former, in strictness, are such as shew the parts of time; the latter, such as publish it by striking: though the name watch is ordinarily appropriated to pocket-*Clocks*; and that of *Clocks* to larger machines, whether they strike or no.

The parts common to both kinds of movements, see under the article **MOVEMENT**.—Those peculiar to watches and *Clocks*, see under **WATCH-WORK**, and **CLOCK-WORK**.

The invention of *Clocks* with wheels, is referred to Pacificus arch-deacon of Verona, who lived in the time of Lotharius, son of Louis the Debonnair; on the credit of an epitaph quoted by Ughelli, and borrowed by him from Panvinus.

They were at first called *nocturnal dials*; to distinguish them from sun-dials, which shewed the hour by the sun's shadow.—Others ascribe the invention to Boethius, about the year 510.

Mr. Derham makes *Clock-work* of a much older standing; and ranks Archimedes's sphere, mentioned by Claudian, and that of Polidonius, mentioned by Cicero, among the machines of this kind; not that either their form or use were the same with those of ours: but that they had their motion from some hidden weights, or springs, with wheels, or pulleys, or some such *Clock-work* principle. Thus he understands the *Inchusuri variis famulatur spiritus astris*; & *vicum certis motibus urget opus*.

But be this as it will, it is certain the art of making *Clocks*, such as are now in use, was either first invented, or at least retrieved, in Germany about 200 years ago.

The water-*Clocks*, or clepsydræ, and sun-dials, have both a much better claim to antiquity.

—The French annals mention one of the former kind, sent by Aaron king of Persia to Charlemagne, about the year 807, which seemed to bear some resemblance to the modern *Clocks*: It was of brass, and shewed the hours by twelve little balls of the same metal, which fell at the end of each hour, and in falling, struck a bell, and made it sound. There were also figures of twelve cavaliers, which at the end of each hour came forth at certain apertures, or windows in the side of the *Clock*, and shut them again, &c.

Among the modern *Clocks*, the most eminent for their furniture, and the variety of their motions and figures, are those of Strasbourg, and of Lyons. In the first, a cock claps his wings, and proclaims the hour; the angel opens a door, and salutes the virgin; and the holy spirit descends on her, &c. In the second, two horsemen encounter, and beat the hour on each other; a door opens, and there appears on the theatre the virgin with Jesus Christ in her arms; the magi, with their retinue, marching in order, and presenting their gifts; two trumpeters founding all the while to proclaim the procession. See *Scotius*; see also Salmatus on Solinus, Mafius de *Tininnabulari*, and Kircher in his *Museum Romanum*, and *Oedip. Egypt.*

The invention of pendulum *Clocks* is owing to the happy industry of the last age: the honour of it is disputed between Huygens and Galileo. The former, who has a volume on the subject, declares it was first put in practice in the year 1657, and the description thereof printed in 1658. Becher, *de nova temporis dimetiendi theoria*, anno 1680, fiddles for Galileo; and relates, though at second hand, the whole history of the invention: adding, that one Tresler, clock-maker to the father of the then grand duke of Tuscany, made the first pendulum *Clock* at Florence, by direction of Galileo Galilei; a pattern of which was brought into Holland.

The academy de'l Cimento say expressly, that the application of the pendulum to the movement of a *Clock* was first proposed by Galileo, and first put in practice by his son Vincenzo Galilei, in 1649.

Be the inventor who he will, it is certain the invention never flourished till it came into Huygens's hands, who insists on it, that if ever Galileo thought of such a thing, he never brought it to any degree of perfection.

The first pendulum *Clock* made in England, was in the year 1622, by M. Fromantil a Dutchman. See **PENDULUM**.

Pendulum *CLOCK*. } See the articles { **PENDULUM Clock**.

Pocket *CLOCK*. }

Repeating *CLOCK*. } **WATCH**,

CLOCK-WORK, is that part of the movement which strikes the

hour, &c. on a bell.

The wheels it consists of are the great, or first wheel; which is that the weight or spring first drives: in sixteen or twenty hour-*Clocks*, this has usually pins, and is called the *pin-wheel*; in eight-day pieces, the second wheel is commonly the pin-wheel, or striking-wheel. Next the striking-wheel, is the detent-wheel, or hoop-wheel, having a hoop almost round it, wherein is a vacancy at which the *Clock* locks. The next is the third, or fourth wheel, according to its distance from the first. The last is the flying pinion, with a fly, or fan to gather air, and so bridle the rapidity of the *Clock's* motion. To these must be added the pinion of report; which drives round the locking-wheel, called also the *count-wheel*; ordinarily with eleven notches in it, unequally distant, to make the *Clock* strike the hours. See **WHEEL**.

Besides the wheels, to the *Clock*-part belongs the rafh, or ratch; a kind of wheel with twelve large fangs, running concentric to the dial-wheel, and serving to lift up the detents every hour, and make the *Clock* strike: the detents, or stops, which being lifted up, and let fall, lock and unlock the *Clock* in striking: the hammers which strike the bell: the hammer-tails, by which the striking pins draw back the hammers: latches, whereby the work is lifted up and unlocked; and lifting-pieces, which lift up and unlock the dents.

Theory and Calculation of CLOCK-Work.—The method of calculating the numbers of a piece of *Clock-work*, having something in it very pretty, and at the same time very easy and useful, we shall give the readers the rules relating thereto: referring, for the general rules that obtain in the calculation of all movements, of watch as well as *Clock-work*, to the article *MOVEMENT*; and for the particular rules of watch-work, to the article *WATCH-Work*.

For the strict calculation itself, it bears that affinity to the calculation of watch-work, that to avoid the repetitions we shall refer to that head: what *Clock-work* has peculiar to itself, will be conceived from what follows.

Rules for calculating the striking part of a CLOCK.—First then, Observe that regard, here, needs only be had to the count-wheel, striking-wheel, and detent-wheel, which move round in this proportion: the count-wheel commonly goes round once in 12 or 24 hours: the detent-wheel moves round every stroke the *Clock* strikes, or sometimes but once in two strokes; wherefore, it follows, that,

Secondly, as many pins as are in the pin-wheel, so many turns hath the detent-wheel in one turn of the pin-wheel; (or, which is the same) the pins of the pin-wheel are the quotients of that wheel, divided by the pinion of the detent-wheel. But if the detent-wheel move but once round in two strokes of the *Clock*, then the said quotient is but half the number of pins.

Thirdly, As many turns of the pin-wheel as are required to perform the strokes of 12 hours, (which are 78) so many turns must the pinion of report have, to turn round the count-wheel once: or thus, the quotient of 78, divided by the number of striking pins, shall be the quotient for the pinion of report and the count-wheel; and this is in case the pinion of report be fixed to the arbor of the pin-wheel, which is commonly done.

An example will make all plain: the locking wheel being 48, the pinion of report 8, the pin-wheel 78, the striking-pins are 13, and so of the rest. Note also, that 78 divided by 13 gives 6, the quotient of the pinion of report. As for the warning-wheel, and flying-wheel, it matters little what numbers they have; their use being only to bridle the rapidity of the motion of the other wheels.

The following rules will be of good service in this calculation.—
1. To find how many strokes a *Clock* strikes in one turn of the fufy, or barrel. As the turns of the great wheel, or fufy, are to the days of the *Clock*'s continuance; so is the number of strokes in 24 hours, viz. 156, to the strokes of one turn of the fufy.

2. To find how many days the *Clock* will go. As the strokes in 24 hours are to those in one turn of the fufy; so are the turns of the fufy to the days of the *Clock*'s going.

3. To find the number of turns of the fufy, or barrel. As the strokes in one turn of the fufy, are to those of 24 hours; so is the *Clock*'s continuance, to the turns of the fufy, or great wheel.

4. To fix the pin of report on the spindle of the great wheel. As the number of strokes in the *Clock*'s continuance is to the turns of the fufy; so are the strokes in 12 hours, viz. 78, to the quotient of the pinion of report, fixed on the arbor of the great wheel.

5. To find the strokes in the *Clock*'s continuance. As 12 is to 78, so are the hours of the *Clock*'s continuance to the number of strokes in that time.

To add Chimes to a piece of *CLOCK-work*. See the article *CHIMES*.

Balance of a *CLOCK*. See the article *BALANCE*.

Clock-Makers Compasses. See the article *COMPASSES*.

CLOISTER, CLAUSTRUM, a habitation furrounded with walls, and inhabited by canons, or religious.

In a more general sense, *Cloister* is used for a monastery of religious of either sex.

In a more restrained sense, *Cloister* is used for the principal part of a regular monastery, consisting of a square built around; ordinarily, between the church, the chapter-house, and the refectory; and over which is the dormitory. See *DORMITORY*, &c.

The *Cloisters* served for several purposes in the ancient monasteries. Petrus Blesensis observes, that it was here the monks held their lectures: the lecture of morality at the north-side, next the church; the school on the west, and the chapter on the east; spiritual meditation, &c. being reserved for the church.

Du Cange concludes, that all these different exercises were performed in the *Cloister* itself; but by mistake. The church, the chapter-house, and the school were not parts of the *Cloister*, but buildings adjoining to it.

Lanfranc observes, that the proper use of the *Cloister* was for

the monks to meet in, and converse together, at certain hours of the day.

The form of the *Cloister* was square; and it had its name *claustrum*, from *claudo*, I shut or close, as being inclosed on its four sides with buildings.

Hence, in architecture, a building is still said to be in form of a *Cloister*, when there are buildings on each of the four sides of the court.

CLOISTERED Monks. See the article *MONK*.

CLOSE, in heraldry. When any bird, addicted to flight, is drawn in a coat of arms, in a standing posture; with its wings close down about it, and not either flying or displayed, they blazon it by the word *Close*.

In which sense *Close* stands opposed to *Volant*. See *VOLANT*.

Close is not applied to the peacock, dunhill-cock, &c. in regard that it is their ordinary posture.

The term *Close* is likewise used for the barnacles, or bits of a bridle, when not extended, as they are usually born.

It is also applied to the bearing of a helmet, with the vizor down: A barnacle *Close*, helmet *Close*, &c.

CLOSE, in music. See the article *CADENCE*.

CLOSE Field. See the article *FIELD*.

CLOSE Fights, a-board a ship, are bulk-heads put up fore and aft in the ship, for the men to stand behind in a close engagement, and fire on the enemy; or if the ships be boarded, to scour the decks.

CLOSE Fire. See *FIRE*, and *REVERBERATION*.

Pound CLOSE. See the article *POUND*.

CLOSET, in heraldry, signifies the half of a bar. See *BAR*.

Clerk of the CLOSET. See the article *CLERK*.

CLOTH, in commerce, in its general sense, includes all kinds of stuffs wove or manufactured on the loom, whether their threads be of wool, hemp, or flax.

CLOTH, is more peculiarly applied to a web, or tissue of woollen threads, interwoven; whereof some, called the *warp*, are extended lengthwise, from one end of the piece to the other; the rest, called the *woof*, are disposed a-crofs the first, or breadthwise of the piece.

Cloths are woven on the looms as well as linens, druggets, ferges, camlets, &c. They are of various qualities, fine, coarse, strong, &c. some are made of wool, and this of different colours; the wool being dyed and dressed, are first spun, then wove: others are wrought white, destined to be died in scarlet, black, blue, green, yellow, &c.—Their breadths and lengths are various, according to the places where they are manufactured.

The goodness of *CLOTH* consists 1^o, In the wool's being fine, and well dressed. See *WOOL*.—2^o, In its being spun equally; always observing, however, that the thread of the warp be finer and better twined than that of the woof.

3^o, In the *Cloths* being well wrought and beaten on the loom, so as to be every where equally close and compact.—4^o, In the wool's not being finer and better at one end of the piece than in the rest.—5^o, In the lifts being sufficiently strong, and of the same length with the stuff; and that they consist of good matter, as wool, hair, or ostrich feathers, or the hair of Danish dogs; which last is the best.—6^o, In the *Cloth*'s being well cleared of the knots, and other imperfections.—7^o, In its being first well scoured with good fullers-earth, then filled with the best white soap, and washed out in clear water. See *FULLING*.—8^o, In the hair or nap's being well drawn out with the teazle, or thistle, on the pole, without being too much opened. See *TEAZLE*.—9^o, In its being thorn close; yet without laying the ground or thread bare. See *SHEPPING*.—10^o, In its being well dyed.—11^o, In its not being stretched, or pulled farther than is necessary to set it square, and bring it to its just length and breadth. See *TENTER*.—12^o, In its only being pressed cold; hot-pressing being an utter enemy to *Cloth*.

Manufacturing of white CLOTHS for dying.—The best wools for the purpose are those of England and Spain; especially those of Lincolnshire, and Segovia.

To use them to the best advantage; when taken out of the bales, they must be scoured, by putting them in a liquor somewhat more than luke-warm, composed of three parts of fair water, and one of urine. After the wool has continued long enough in the liquor to dissolve and loosen the grease, it is taken out, drained, and washed in a running water: It is known to be well scoured, when it feels dry to the touch, and has no smell but the natural smell of the sheep.

In this state it is hung out to dry in the shade; the heat of the sun being apt to make it harsh, and untractable. When dry, it is beat with rods on hurdles of wood, or on ropes, to clear out the dust and grosser filth: the more it is thus beat and cleaned, the more soft it becomes, and the better it spins.—After beating, it is well picked, to clear the rest of the filth, that had escaped the rods.

It is now in a state to be oiled, and carded on large iron cards, placed a-slope. The best oil for the purpose is oil of olives; one fifth of which, at least, should be used for the wool destined for the woof, and a ninth for that of the warp.

It is now given out to the spinners; who first card it on the knee, with small fine cards; then spin it on the wheel: observing to make the thread of the warp smaller by one third than that of the woof, and much clover twisted; in order to this, the latter must be spun with the band, or string open, and the former with it crossed.

The thread being thus spun, reeled and made into skeins; that destined for the woof is wound on spools, *i. e.* on little tubes, or pieces of paper, or ruffles, so disposed as that they may be easily put in the eye of the shuttle. That for the warp is wound on a kind of rochets, or large wooden bobbins, to dispose it for warping.

When warped, it is stiffen'd with size; whereof, that made of shreds of parchment is the best; and when dry is given to the weavers, who mount it on the loom.

The warp being on the loom, the weavers, who are two to each loom, one on each side, tread at the same time, alternately, on the same treadle; *i. e.* now on the right step, and now on the left, which raises and lowers the threads of the warp equally; between which they throw, transversely, the shuttle from the one to the other. And each time that the shuttle is thrown, and so a thread of the woof inserted within the warp, they strike it conjointly with the same frame wherein is fastened the comb, or reed, between whose teeth the threads of the warp are passed; repeating the stroke as often as is necessary; in some *Cloths* no less than twelve or thirteen times, *viz.* six with the warp open, and seven shut.

It may be observed, that the more the threads of the woof are struck against each other, the closer the *Cloth* is: and hence it becomes enabled to sustain the violence of the fulling-mill, as well as of the teazel, or fulling-thistle, without fretting or opening.

The weavers having continued their work till the whole warp is filled with woof, the *Cloth* is finished: It is taken off the loom by unrolling it from the beam whereon it had been rolled in proportion as it was wove; and is now given to be cleared of the knots, ends of thread, straws, and other filth; which is done with little iron nippers.

In this condition it is carried to the fullery, to be scoured with urine, or a kind of potters clay well cleaned and steeped in water, put along with the *Cloth* in the trough, wherein it is filled. See FULLING.

The *Cloth* being again cleared from the earth, or urine, by washing it in water, is returned to the former hands, to have the lesser filth, small straws, and almost imperceptible knots taken off as before: then it is returned to the fuller, to be beat and filled with hot water, wherein five or six pounds of soap have been dissolved. The soap most esteemed is the white, especially that of Genoa. After mulling an hour and a half, it is taken out to be smoothed, *i. e.* to be pulled by the lifts lengthwise, to take out the wrinkles and creases occasioned by the force of the mallets, or pestles falling on the *Cloth* when in the troughs.

The smoothing is repeated every two hours, till the fulling be finished, and the *Cloth* brought to its proper breadth: after which, it is washed in clear water, to purge it of the soap, and given, all wet, to the carders, to raise the hair, or nap, on the right side, with the thistle or weed; wherewith they give it two rubs or courses, the first against the grain, the second with the grain. The *Cloth* being dried after this preparation, the cloth-worker takes it, and gives it its first cut, or sheering.—This done, the carders resume it, and after wetting it, give it as many more rubs or courses with the teazel as the quality of the stuff requires: always observing to begin against the hair, and to end with it; and to begin with a smoother thistle, proceeding still to a sharper and sharper, as far as the sixth degree.

After this, the *Cloth* being dried, is returned to the cloth-worker, who sheers it a second time, and returns it to the carder; who wetting it again, gives it as many courses as he thinks fit, dries it, and gives it back again to the cloth-worker; who after sheering it the third and last time, returns it to the carders, who repeat their operation as before, till the hair, or nap, be well ranged on the surface of the *Cloth*, from one end of the piece to the other.

It must be observed, that it is indispensibly necessary the *Cloth* be wet, while in the carders hands; in order to which, it is sprinkled from time to time with water.

The nap being finished, and the *Cloth* dried, the cloth-worker gives it as many cuts as he thinks requisite for the perfection of the stuff. It must also be observed, that all the sheerings must be on the right side, except the two last, which must be on the other; and that the *Cloth* cannot be too dry for sheering.

The *Cloth* thus wove, fowered, napped, and shorn, is sent to the dyer.—When dyed, it is washed in fair water, and the cloth-worker takes it again, wet as it is, lays the hair, or nap, with a brush on a table, and hangs it on the tenters; where it is stretched both in length and breadth, enough to smooth it, set it square, and bring it to its proper dimensions, without straining it too much; observing to brush it afresh, the way of the hair, while yet a little moist on the tenter.

When quite dry, the *Cloth* is taken off from the tenter, and brushed again on the table, to finish the laying of the nap: it is then folded, and laid cold under a press, to make it perfectly smooth and even, and to give it a little gloss.

The gloss is given by laying a leaf of vellum, or cap-paper in each plait of the piece; and over the whole a square plank of wood: on which, by means of a lever, the crew of a press is brought down, with the degree of force judged necessary, with regard to the quality of the *Cloth*.—In France, none but scarlets, greens, blues, &c. receive this last preparation; blacks being judged better without it.

Lastly, the *Cloth* being taken out of the press, and the papers removed; it is in a condition for sale, or use.

For the manufacture of mixed CLOTHS, or those wherein the wools are first dyed, then mixed, spun, and wove of the colours intended; the process, except in what relates to the colour, is mostly the same with that just spoke of.

The method of adjusting the mixture, is by first making a felt or flock of the colours of the intended *Cloth*, as a specimen: the wool of each colour is weighed, and when the specimen is to the manufacturer's mind, he mixes, for use, a quantity in the same proportion; estimating each grain of the specimen at twenty pounds weight of the same wool in the *Cloth* to be made.

Thus, if he would mix three colours, *v. gr.* coffee-colour, feuille-mort, and pale blue, the first to be the prevailing colour; he weighs a quantity of each: for instance, 70 grains of the first, 25 of the second, and 20 of the third; then multiplies each by 20 pounds of wool; and thus gains 1400 pounds for the coffee wool; 500 pounds for the feuille-mort, and 400 for the pale blue.

The wools of the specimen thus weighed, are mixed, oiled, carded, moistened with clear water, rubbed with black soap, and in this state wrought a long time in the hands; till they be reduced into a piece of felt, like that used by hatters.

It is then rinsed in water, to purge out the oil and soap; and when dry, the hair, or nap, is carded out with the teazel; then shorn carefully, till the ground appear, and the several colours be discoverable.

Lastly, wetting it a little, and pressing it, he examines it well, and if he be not contented with it, makes another felt; if he be, he proceeds to mix his wools: when mixed, it is beat on hurdles, cleaned, oiled, carded, spun, wove, &c. as in white *Cloth*.

CLOUD, in physiology, a collection of condensed vapour, suspended in the atmosphere. See VAPOUR.

A *Cloud* is a congeries of watery particles, or vesicles raised from the waters, or watery parts of the earth, by the solar, or subterraneous heat, or both; which at their first rise from our globe, are too minute to be perceived; but as they mount, meeting with a greater degree of cold, are condensed, and rendered opaque by the reunion of their parts; so as to reflect light, and become visible.

The manner wherein vapours are raised into *Clouds* may be conceived thus.—Fire being of a light, agile nature, easily breaks loose from bodies wherein it is detained: *For the manner whereof, see BOILING*.

Now, by reason of the exceeding smallness of the particles of fire, their attractive force must be exceedingly great: hence, in their ascent through fluid bodies, part of the fluid will cling around them, and mount up together with them, in form of vesicles of water replete with particles of fire; and these vesicles are what we call *Vapour*.

Further, these vapours being specifically lighter than air, mount in it, till having reached such a region of the atmosphere as is of the same specific gravity with themselves, they will be suspended; till the watery vesicles, which were at first too thin to be perceived, being now condensed by the cold of the superior regions; and their included igneous particles extinct, or at least driven into a less compass, and consequently the parts fit closer together; their density is first augmented so as to render them opaque enough to reflect the sun's light, and become visible; and their specific gravity increased, so as to make them descend: in the former state they are called *Clouds*; and in the latter, when they arrive at us, rain.

Clouds, beside their use when they descend in showers, are of service while suspended in the atmosphere; as they help to mitigate the excessive heat of the torrid zone, and screen it from the beams of the sun, especially when in his zenith.

*CLOVE**, an aromatic fruit, bore on a tree of the same name; by the Latins also called *Caryophyllus*.

* The fruit is somewhat in form of a nail; whence the term *Clove* from the French *Clou*, nail.

The *Clove-tree* was antiently very common in the Molucco islands; where all the European nations, who traffic in spices to the Indies, furnished themselves with what quantity of *Cloves* they required. At present there are scarce any found but in the island of Ternate: the Dutch, in order to render themselves masters of that merchandise, having dug up the *Clove-trees* of the

Moluccos, and transplanted them to Ternate; so that there are none now to be had but through their hands.

The tree is very large; its bark resembles that of the olive-tree, and its leaves those of the laurel: its fruit falling, takes root, and thus it multiplies itself without any culture. It is said, it will not allow any other herb, or tree, to grow near it; its excessive heat drawing to it all the humidity of the soil.

When the *Globe* first begins to appear, it is of a greenish white colour; as it ripens it grows brown. Nor is there any preparation necessary in order to render it such as it comes to us, but to dry it in the sun; whatever some authors talk of first steeping it in sea-water, to preserve it from worms.

Towards the head, it separates into four; and the four quarters being shaped angle-wise, their apices meeting at the top, form a kind of crown, somewhat in the antique manner.

Cloves must be chosen dry, brittle, harsh to the touch, well grown, of a dusky reddish colour, a hot aromatic taste, an agreeable smell, and, if possible, with the shank on.

Their properties are, to warm and dry, to correct a fetid breath, to sharpen the sight, dissipate films in the eyes, fortify the stomach and liver, and stop vomiting. They are used in apoplexies, palsies, lethargies, and other diseases of the brain.

Such of the fruit as escape the gatherers, grow and swell on the tree, and become full of a gum; these are sometimes used in medicine, and are called *Mother of Cloves*.

There is also an oil drawn from *Cloves* by distillation; which, when new, is of a pale yellow colour, but reddens as it grows old: it is used in medicine as a sovereign remedy for the tooth-ach, and in compositions with the same view as the fruit. It is also much used among the perfumers.

The natives call the *Clove-tree* *chamque*, the Persians and Arabs *karumfil*, and the Turks *kalafour*. They make several preparations both of the flowers, and the fruit.

CLOVE-CINNAMON. See the article CINNAMON.

CLOVE-WATER. See the article WATER.

CLOUGH, or Draught, in commerce, an allowance of two pounds in every hundred weight for the turn of the scale; that the commodity may hold out weight when sold out by retail.

CLOUT-NAILS. See the article NAIL.

CLUNY, or CLUGNY, a celebrated abbey of Benedictin monks, in a city of that name; being the head, or chief of a congregation denominated from them.

It is situate in the Maconnais, a little province of France, on the river Grône; and was founded by William duke of Berry and Aquitaine; or, as others say, by the abbot Bernon, supported by that duke, in the year 910.

This abbey was antiently so very spacious and magnificent, that in 1245, after the holding of the first council of Lyons, pope Innocent IV. went to *Cluny*, accompanied with the two patriarchs of Antioch and Constantinople, twelve cardinals, three archbishops, fifteen bishops, and a great number of abbots; who were all entertained, without one of the monks being put out of their place: though S. Louis, Q. Blanche his mother, the duke of Artois his brother, and his sister, the emperor of Constantinople, the sons of the kings of Arragon and Castile, the duke of Burgundy, six counts, and a great number of lords, with all their retinue, were there at the same time.

Cluny, at its first erection, was put under the immediate protection of the apostolick see; with express prohibition to all secular and ecclesiastick powers, to disturb the monks in the possession of their effects, or the election of their abbot. By this they pretended to be exempted from the jurisdiction of bishops; which, at length, gave the hint to other abbies to insist on the same.

Cluny is the head of a very numerous and extensive congregation: in effect, it was the first congregation of divers monasteries united under one chief, so as only to constitute one body, or, as they call it, one order, that ever arose.

CLYPEUS, or CLYPEUM, *Buckler*; a piece of defensive armour, which the antients used to carry upon the arm, to secure them from the blows of their enemies.

The figure of it was either round, oval, or sexangular: in the middle was a boss of iron, or of some other metal, with a sharp point. See SHIELD.

CLYSSUS, a chymical production, consisting of the most efficacious principles of any body, extracted, purified, and then re-mixed.

A *Clyssus* is when the several species, or ingredients of a body, are prepared and purified separately, and then combined again.—Thus, salt, sulphur, oil, spirit, and mercury, reassembled into one body, by long digestion, &c. make a *Clyssus*.

Clyssus of Antimony, is an agreeable acid spirit, drawn by distillation from antimony, nitre, and sulphur mixed together. There is also a *Clyssus* of vitriol, which is a spirit drawn by distillation from vitriol dissolved in vinegar.—This is used by physicians in various diseases, and to extract the tinctures of several vegetables.

Clyssus is also used among some authors for a kind of sapa, or extract, made with eight parts of the juice of a plant, and one of sugar, feethed together into the consistence of honey.

CLYSTER, *Kλυστήρ*, in medicine, a liquid remedy, or injection,

introduced into the intestines by the fundament; in order to refresh them, loosen the belly, moisten and soften the faeces, dissipate wind, &c.

* The word comes from the Greek *κλῦω*, *lave*, *abluo*, I wash.

Clysters are sometimes made of bran-water, and milk, but more usually of decoctions of certain herbs; to which are added honey, brown sugar, and sometimes lenitive electuary, and other drugs. *Clysters* are either emollient, carminative, lenitive, astringent, laxative, anodyne, uterine, antifebrile, nourishing, &c.

Nourishing CLYSTERS, are those applied with design to nourish persons who cannot take in any aliment at the mouth. Hildanus tells us, that Aubery, a physician, fed a woman of quality six weeks with *Clysters* composed of capons flesh, and other fowls, boiled to a pulp, with yolks of eggs, applied twice a day.

It is difficult, however, to conceive how *Clysters* should nourish; and the case is briskly controverted in the memoirs of the French royal academy, between M. Littre, who maintains the negative, and M. Lemery.

The arguments urged by the first, are, that the materials of the *Clyster*, for want of the ordinary passage, want the preparation necessary to be converted into nourishment; and beside that, are out of the road for getting into the blood: for in the first of the large intestines, called the *cæcum*, is a valve called *valvula Bauhini*, to oppose the passage of any food into the small intestines: and there are no lacteal veins in the large intestines, but abundance in the small ones. But the lacteals are the only canals that can carry the chyle into its receptacle, and the chyle is the only substance that can nourish.

To this, M. Lemery objects, that very great anatomists have found lacteals in the large intestines, though but in small number: but though there were none, adds he, the mesaraic veins are indisputably distributed to these intestines; and may easily be supposed to pump up the most subtil part of a broth, and carry it into the blood. M. Mery has passed a liquor immediately from the large intestines into these veins; besides, that the animal machine is so porous throughout, that nature seems to have intended an extraordinary way of conveying fluids into the blood, to be ready on extraordinary occasions.

This notion will appear incontestable, if M. Morin's theory of the passage of the urine be admitted.

Herodotus says, the Egyptians were the first who invented *Clysters*; or rather, who applied them to use. Galen and Pliny add, that they took the hint from a bird of their country, called *Ibis*, which they frequently observed to make this kind of injection with its beak, and afterwards to discharge itself several times. Others say, that the ciconia, or stork, first taught men the application of *Clysters*.

Uterine CLYSTERS, are injections into the uterus, or womb.

Catholicon for CLYSTERS. See the article CATHOLICON.

CNEMODACTYLÆUS, in anatomy, a muscle, otherwise called *extensor tertii internodii digitorum*. See **EXTENSOR tertii internodii**, &c.

COACERVATUM vacuum. See the article VACUUM.

COACH, a vehicle for commodious travelling, suspended on leathers, and moved on wheels.

In England, and throughout Europe, the *Coaches* are drawn by horses, except in Spain, where they use mules. In a part of the east, especially the dominions of the great Mogul, their *Coaches* are drawn by oxen. In Denmark they sometimes yoke rein deer in their *Coaches*; though this is rather for curiosity than use.

The *Coachman* is ordinarily placed on a seat raised before the body of the *Coach*. But the Spanish policy has displaced him in that country by a royal ordonnance; on occasion of the duke d'Oliveras, who found that a very important secret whereon he had conferred in his *Coach*, had been overheard, and revealed by his coachman: since that time, the place of the Spanish coachman, is the same with that of the French stage-coachman, and our postillion, viz. on the first horse on the left.

The invention of *Coaches* is owing to the French: yet are not *Coaches* of any great antiquity, even in France; scarce reaching beyond the reign of their Francis I.

Their use, at their first rise, was only for the country: and authors observe, as a thing very singular, that there were at first no more than two *Coaches* in Paris; the one that of the queen, and the other that of Diana, natural daughter of Henry II. The first courtier who had one, was Jean de Laval de Bois Dauphin; whose enormous bulk disabled him from travelling on horse-back.

One may hence judge how much vanity, luxury, and idleness have grown upon our hands in later days; there being now computed in that city no less than 15000 *Coaches*.

Coaches have had the fate of all other inventions to be brought by steps and degrees to their perfection; at present they seem to want nothing, either with regard to ease or magnificence. Louis XIV. of France, made several sumptuary laws for restraining the excessive richness of *Coaches*, prohibiting the use of gold, silver, &c. therein; but they have had the fate to be neglected.

Coaches may be divided into two kinds; those that have iron bows, or necks, and those that have not: both the one and the other have two principal parts, the body, and the train, or carriage.

COA

The *body* is that part where the passengers are disposed; and the *carriage* is that which sustains the body, and to which the wheels are fastened, that give motion to the whole machine.

Coaches are distinguished, with regard to their structure, into *Coaches*, properly so called, *Chariots*, *Calafes*, and *Berlins*.—With regard to the circumstances of their use, &c. we distinguish *Stage-Coaches*, *Hackney-Coaches*, &c.

Chariot, or *Half-Coach*, is a kind of *Coach* that has only a seat behind; with a stool, at kind, before.—When these are very gay, richly garnished, and have five glasses, they are called *Calafes*.

Calaf is also a kind of light small *Coach*, with very low wheels, richly adorned, used on occasions of pleasure; and open on all sides, to take the air, and enjoy the prospect. There are of these *Calafes* with one, two, and three seats; where the persons do not sit facing one another, as in the common *Coaches*, but all forwards, each seat having its back.

Hackney-Coaches, those exposed to hire, in the streets of London, and some other great cities, at rates fixed by authority. Those in London are under the direction of commissioners, who take cognizance of all causes and disputes arising thereupon.—They are distinguished by numbers affixed to the *Coach-doors*; and the fares, or rates, are fixed by a statute 14 Car. II. and confirmed by another in the fifth and sixth of king William III.

For a whole day of twelve hours the fare is 10 s. for a single hour 1 s. 6 d. for every hour after the first, &c.—At these rates, they are obliged to carry passengers any where within ten miles of London.

Stage-Coaches, are those appointed for the conveyance of travellers from one city or town to another.

COADJUTOR, *Fellow-Helper*, is properly used for a prelate joined to another, to assist him in the discharge of the functions of his prelature; and even, in virtue thereof, to succeed him.

The *Coadjutor* has the same privileges with the bishop himself.—*Coadjutors* were formerly appointed by kings, for archbishops and bishops grown old, or absent, and not able to administer their dioceses. But the right of appointing *Coadjutors*, in Romish countries, is now reserved to the pope alone.

Coadjutors are also called bishops in *partibus infidelium*; in regard it is necessary the *Coadjutor* of a bishop should be a bishop himself; without which, he cannot discharge the office.

The use of *Coadjutors* in the church, is borrowed from the Roman empire. Symmachus speaks of assistants, or *Coadjutors*, given to magistrates; and calls them *adjutores publici officii*.

The popes, formerly, made a shameful abuse of the *Coadjutories*: some they granted to children, and young people, with this clause, *donec ingressus fuerit*; 'Till they were capable of entering upon the administration of the office.' Others they granted to persons not in orders, with this clause, *donec accesserit*; and others to persons at a great distance, with this clause, *cum regressus*; but the council of Trent tied down the pope's hands, by adding abundance of restrictions on the article of *Coadjutors*. In nunneries they have *Coadjutories*; who are religious, nominated to succeed the abbess, under pretence of aiding her in the discharge of her office. See *ABBESS*.

COAGMENTATION, is used among chymists, for the act of melting down a matter, by casting in certain powders, and afterwards reducing the whole into a concrete, or solid.

COAGULATION, the condensing, or thickening of a fluid matter, without its losing any of the sensible parts which occasioned its fluidity; as we frequently see in blood, milk, &c. We distinguish between that kind of thickening which is effected by the evaporation of the fluid parts of a body, as in clay, which condenses in the sun, properly called *hardening*; and that effected without any loss of its substance, called *coagulating*. Thus, we say, that cold *coagulates* blood, &c.

There is one general term, *viz. concretion*, which includes both *Coagulation*, condensation, and hardening.

Coagulation chiefly depends on the admixture of salts of different natures; as when spirit of vitriol is poured on oil of tartar; or when oils are mixed in a mortar with saline, or aqueous liquors, as in the unguentum nutritum.

By injecting an acid into the vein of an animal, the blood *coagulates*; which stops its circulation, and brings immediate death.—Several poisons have their effect by inducing a *Coagulation*.

COAL, a black, sulphurous, inflammable matter, dug out of the earth; serving in many countries as the common fuel. This we sometimes call *Pit-Coal*, *Essist Coal*, *Earth-Coal*, and *Natural-Coal*; to distinguish it from an artificial fuel made in imitation hereof, by half burning the branches and roots of trees; properly called *Charcoal*, and *Smallcoal*: in places, whither *Coal* is brought by sea, it is called *Sea-Coal*.

Cannel, or *Candle-Coal*, is a sort of fossil coal found in divers of the northern countries; very hard, glossy and light; apt to cleave into thin flakes; and when kindled, it yields a continual blaze till it be burnt out.—Camden suspects this to be the lapis Obidianus of the ancients.

Pit-Coal is ranked among the number of minerals, and the places

COA

it is dug out of are called *Coal-Mines*, or *Coal-Pits*. It is common in most countries of Europe: though the English *Coal* is of most repute, even in foreign countries; notwithstanding some pretend that of the *Fosse* in Auvergne is not any thing inferior to it.

The goodness of *Coal* is found by its being as free as possible from sulphur, in its heating iron well, and in its burning a long time in the smith's forge. The English *Coal* has this peculiar to it; that it never lights so perfectly, as when water is thrown on it.

The commerce of *Coal* is very considerable in England; great quantities are exported to France, &c. by way of Rouen. The measure whereby it is sold is the chaldron, containing thirty-six bushels.

In the memoirs of the French royal academy, we have an account of two experiments on the common *Pit-Coal*, made by M. Des Landes while in England, and which he thinks have escaped the English philosophers.

1st, Pounding some *Coal*, and putting half an ounce of it in a vial of water, the mixture became quite black: but leaving it exposed to the air in a window, during a cold winter night, in the morning it was found frozen, and turned to a reddish colour. The reason of the change must be, that the frost had disengaged the sulphurs of the *Coal*: though one would little expect such an effect from it.

2dly, From an infusion of cinders in brandy, mixed with iron filings, arises a black tincture, which brightens in proportion as it is heated; when arrived at the heat of boiling, the colour becomes perfectly fine and soft, and gives a dye to cloth, which no workman can imitate.

The strata, or veins of *Coals* in coalpits are numerous, and their order, quality, &c. are very different in different places.

In those at Dudley in Staffordshire, the strata, below the turf, are two or three clays, a grey stone, and a hard grey rock, then they are expressed in the *Philosophical Transactions* to be, 1^o, *Coal*, called *Bench-Coal*; 2^o, *Slipper-Coal*, less black and shining than the former; 3^o, *Spin-Coal*, more black and shining; 4^o, *Stone-Coal*, much like *Canal-Coal*.

These strata have between each of them a bat, or bed, of a peculiar sort of matter, about the thickness of a crown-piece. Below these are divers metalline strata; as a black substance called the *Dun-row bat*; a grey iron ore, called the *Dun-row iron-stone*; a bluish bat, called *White-row*; a blackish iron ore, called *White-row grains*, or *iron-stone*; a grey iron ore, called *Mid-row grains*; a black fossil substance, called the *Gubbin-bat*; a black iron ore, called *Gubbin iron-stone*; a dark grey iron ore, called *Rubble iron-stone*: and lastly, the *table bat*.

Then 5^o, comes a coarse sort of *Coal*, called *Foot Coal*; a black brittle bat: 6^o, The *Heathen-Coal*; 7^o, A substance like coarse *Coal*, though called a *Bat*, because it does not burn well: And 8^o, *Bench-Coal*. See Supplement, articles LITHANTHRAX, and LAPIS AMPELITES.

Small-Coal is a sort of charcoal, prepared from the spray, and brush-wood, stripped off from the branches of coppice wood, sometimes bound in bays for that purpose, and sometimes prepared without binding.

The wood they dispose on a level floor, and setting a portion of it on fire, they throw on more and more, as fast as it kindles; whence arises a sudden blaze, till all be burnt that was near the place. As soon as all the wood is thrown on, they cast water on the heap, from a large dish, or scoop; and thus keep plying the heap of glowing *Coals*, which stops the fury of the fire, while with a rake they spread it open, and turn it with shovels till no more fire appears. When cold, the coals are put up into sacks for use.

Char-Coal. See its preparation under *CHARCOAL*.

COALITION, the re-union, or growing together of parts before separated. See *CONGLUTINATION*, &c.

COAST, a sea-shore, or the country adjoining to the edge of the sea. See *SEA*, &c.

COASTING, that part of navigation, wherein the places sailed to, and from, are not far distant; so that a ship may sail in sight of the land, or within sounding, between them.

Such are the voyages on the narrow, or British seas, between England, Holland, and France; also those about the British seas, and in the Mediterranean, &c.

For in the performance hereof, there is only required good knowledge of the land, and the use of the compass, and of the lead, or sounding line.

COASTING, in agriculture, &c. denotes the transplanting of a tree, and placing it in the same situation, with respect to east, west, north, &c. as it stood in before.

COAT of Arms, in heraldry, a cloak, or habit, worn by the ancient knights over their arms, both in war, and at tournaments; and still born by the heralds at arms.

It was a kind of furcoat, reaching only as low as the navel; open at the sides, with short sleeves; sometimes furred with ermins and vair; whereon were applied the armories of the knight, embroidered in gold and silver, and enamelled with beaten tin, coloured black, green, red, and blue: whence the rule, never to apply colour on colour, nor metal on metal.

The *Coats of Arms* were frequently open, and diversified with bands

bands and fillets of several colours, alternately placed, as we still see cloths scarletted, watered, &c. hence they were also called *Divizer*, or *Diviser*, as being divided, or composed of several pieces, sewed together; whence the words, *fesse*, *pale*, *chevron*, *bend*, *cross*, *sautee*, *lozenge*, &c. which have since become honourable pieces, or ordinaries of the shield. See each in its place, *FESSE*, *BEND*, *CROSS*, &c.

Coats of Arms, and *Banner*, were never allowed to be wore by any but knights, and ancient nobles.

COAT of Mail, *jaque de mail*, a kind of armour made in form of a shirt; consisting of iron rings wove together net-wise. See *MAIL*.

COAT, in anatomy. See the article *TUNIC*, and *EYE*.

COBALT, in natural history, a kind of marcasite, supposed to be the cadmia of the antients; out of which is drawn arsenic, and smalt.

Cobalt usually contains a little silver, some copper, but much arsenic. There are various mines of *Cobalt*, especially in Saxony; and some in France, and England. See *Supplement*, article *COBALT*.

COBWEB. See the articles *WEB*, and *SILK*.

COCCIFEROUS, in botany, such plants, or trees, as bear berries.

COCCULUS *Indicus*, a poisonous narcotic berry, known mostly now to poachers, who have got a trick of intoxicating fish therewith, so as to take them out of the water with their hands; for which reason these berries are called *bacca piscicaria*, fishers-berries. See *Supplement*, article *COCCULUS INDICUS*.

COCYGIS *os*, in anatomy, a bone joined to the extremity of the *os sacrum*; composed of three or four bones, whereof the lower is still less than the upper, till the last ends in a small cartilage.—See *Tab. Anat. (Osteol.)* fig. 7. n. 21. It resembles a little tail turned inwards; or rather, as some imagine, the beak of a cuckow; whence the name.

Its use is to sustain the strait gut: it yields to the pressure of the *foetus* in women in travel; and midwives use to thrust it backwards; but sometimes too rudely and violently, which is the occasion of great pain, and several bad effects.

COCHINEAL, or *COCHINEEL*, a drug used by the dyers, &c. for giving red colours, especially crimsons, and scarlets; and likewise in medicine as a cardiac and alexipharmic.

It is brought from the West-Indies: but authors have been divided as to its nature; some taking it to be a kind of worm, and others for the berry of a tree. F. Plumier, a celebrated botanist, has maintained the former opinion, and Pomet very absurdly the latter. That author is very wide of the truth in the description he has given of *Cochineal*. Dampier tells us, there are two sorts; one an insect, and the other a feed, and gives a precise description of each kind as follows:

The *COCHINEAL Worm*, is an insect ingendered in a fruit resembling a pear: the plant which bears it is five or six foot high. Atop of the fruit grows a red flower, which, when mature, falls on the fruit; and that opening, discovers a cleft two or three inches in diameter. The fruit then appears full of little, red insects, having wings of a surprizing smallness, and which would continue and die, and rot there, if not taken out.

The Indians, therefore, spreading a cloth under the tree, shake it with poles, till the insects are forced to quit their lodgings, and fly about the tree; which they cannot do many moments, but tumble down dead into the cloth; where they are left till they be entirely dry: when the insect flies it is red; when it is fallen, black; and when first dried it is greyish; though it afterwards changes colour. See *Tab. Nat. Hist.* fig. 24.

There are whole plantations of the *Cochineal* plant, or *tonna*, as the natives call it, about Guatimala, Chepe, and Guexaca, in the kingdom of Mexico.

The *COCHINEAL Grain*, or, as Dampier calls it, *Syngstris*, is a red berry, growing in America, found in a fruit resembling that of the *Cochineal* plant, or *tonna*. The first shoots produce a yellow flower; then comes the fruit, which is long, and when ripe opens with a cleft of three or four inches. The fruit is full of kernels, or grains, which fall on the least agitation, and which the Indians take care to gather. Eight or ten of these fruits may yield about an ounce of grain. See fig. 24. n° 2. This berry yields a dye almost as beautiful as that of the insect; and a person may be easily deceived in them; though the other is much the most esteemed. Dampier is mistaken in supposing this last a feed. It is an animal of the same kind with the other. The true account of this drug, see in the *Supplement*, article, *COCHINEAL*.

COCHLEA*, in mechanicks, one of the five mechanical powers; otherwise called the *Screw*. See *SCREW*.

* It is thus denominated, from the resemblance a few bears to the spiral shell of a snail, which the Latins call *Cochlea*.

COCHLEA, in anatomy, the third part of the labyrinth, or inner cavity of the ear. See *EAR*.

The *Cochlea* lies directly opposite to the semicircular canals, and is properly so called from the resemblance it has to the shell that snails lie in: through its parietes a small branch of the auditory nerve passes.

Its canal is divided by a septum composed of two substances, one almost cartilaginous, the other membranous.

The two canals that are divided by the septum, are called *scala*; whereof the one, looking towards the tympanum, by the fe-

nebra rotunda, is called *scala tympani*; the other having a communication with the vestibulum, by the fenestra ovalis, is called the *scala vestibuli*; the first lies uppermost, and is the largest; the last lowermost, and is the least.

COCK of a dial, the pin, style, or gnomon. See *GNOMON*.

COCK bearing high. See the article *HIGH-bearing*.

Bloody-heel'd COCK. See the article *HEELER*.

Grubbing a COCK. See the article *GRUBBING*.

Pea-COCK. See the article *PEACOCK*.

Weather-COCK. See the article *WEATHER-COCK*.

COCKET, or *COCQUET*, a seal belonging to the king's custom-house. See *SEAL*.

COCKET, or *COCQUET*, is also a scroll of parchment, sealed and delivered by the officers of the custom-house to the merchants, upon entering their goods; certifying that the goods were customed.

The same word is also used in the statute of bread and ale, 15 Hen. III. where there is mentioned, *Cocket-bread*, among several other kinds. It seems to have been hard sea basket, which perhaps had then some *Cocket*, mark, or seal; or else was so called from its being designed for the use of the cockswains, or seamen.

COCKING Cloth, a device for the catching of pheasants withal. It consists of a piece of coarse canvas, about an ell square, dipped in a tan-pit to colour it; and kept stretched by two sticks, placed from corner to corner, diagonal-wise; a hole being left to peep through. The sportsman then, being provided of a short gun; carries the cloth before him at arms-end; under cover of which, he may approach his game as near as he pleases: when near enough, he puts the noel of his gun thro' the hole, and shoots.

COCKLE-Stairs. See the article *STAIRS*.

COCKPIT, a sort of theatre, whereon game-cocks fight their battels.—The *Cock-Pit* is usually a house, or hovel covered over: they fight on the clod, or green sod; which is generally marked out round, and incompassed with seats, one above another.

The *Cock-Pit Laws*, are principally these: when cocks are set, none are to be on the sod but the two feters. When the cocks are set beak to beak in the middle of the clod, and there left by the feters, if the set cock do not strike in counting twenty, and six times ten, and twenty after all, the battle is lost: but if he do strike, the batel is to begin again, and they must count again. If any offer a mark to a groat, or forty to one, and the wager be taken, the cock must be set, and they are to fight it out. Done, and done, is a sufficient bet, or wager, when the cocks are cast on the clod.

Cock-Pit, in a man of war, is a place on the lower floor, or deck, abast the main capitan, lying between the platform and the steward's room; where are subdivisions, or partitions, for the purser, the surgeon, and his mates.—See *Tab. Ship*, fig. 2. lit. Z.

COCK-ROAD, a contrivance for the taking of woodcocks.—

This bird lies close by day, under some hedge, or near the root of an old tree, to peck for worms under dry leaves, and will scarce stir out, unless disturbed; as not seeing his way so well in the morning; toward the evening he takes wing, to seek for water; flying generally low, and when he finds any thoroughfare in a wood, he ventures through it. To take them, therefore, they plant nets in such places; or, for want of such places ready to their hands, they cut roads through woods, thickets, groves, &c.

These roads they usually make thirty-five or forty foot broad, perfectly straight and clear; and to two opposite trées they tie the net, which has a stone fastened to each corner. Then, having a stand, or place to lie concealed in, at a proper distance, with a stake near the same, to fasten the lines of the net to; when they perceive the game flying up the road, they unwind the lines from off the stake; upon which, the stones drawing it down, the birds are entangled in the same.

COCK-SWAIN, or *COCKSON*, an officer on board a man of war, who hath the care of the boat, or sloop, and all things belonging to it. He is to be always ready with his boat's gang, or crew, and to man the boat on all occasions.—He sits in the stern of the boat, and steers; and hath a whistle to call and encourage his men.

COCOA, or more properly *CACAO*, the nut whose kernel yields the chocolate. See *CACAO*.

COCOS, or *COCO*, is also used for a nut, whose shell is much used by turners, carvers, &c. for divers works.

The *Coco-tree*, which the Malabarians call *renga*, grows straight, without any branches, and ordinarily is thirty or forty foot high: its wood is too spongiuous to be used in carpentry. At the top it bears twelve leaves, ten foot long, and half a foot broad, used in the covering of houses, making mats, &c. Above the leaves grows a large excrescence, in form of a cabbage, excellent to eat; but the taking this off, is mortal to the tree.

Between the leaves and the top arise several shoots, of the thickness of the arm; which, when cut, distil a white, sweet, agreeable liquor, serving as a wine, and as intoxicating: it becomes acid if kept a few hours; and at the end of 24 hours is converted into a strong vinegar; but it may be prepared into brandy. While this liquor distills, the tree yields no fruit; but when the fuckers

fuckers are let grow, it puts forth a large cluster or bunch, where- in the *Coco-nuts* are fastened, to the number of ten or twelve. While they are yet new, and the bark tender, they yield each about half a pint of a clear cooling water: which in a little time becomes first a white, soft pulp, and at length condenses, and assumes the taste of the nut.

The tree yields fruit thrice a-year, and those sometimes as big as a man's head. Many travellers aver, from the size, and the many useful products of this tree, that from a single *Coco-tree*, and its fruit, a ship might be built, equipped, and laden with merchandize and provision.

The *Cocos* of the Antilles, are not so large as those of the East-Indies, Africa, and Arabia: the trees seldom exceed 25 foot in height; and the fruits are in proportion: it is these which are used among us.

In the kingdom of Siam, the *Cocos* fruit, dried and emptied of its pulp, serves as a measure, both for things liquid and dry.

As these shells are not all of the same capacity, but are some larger, others less; their content is first measured with cauris, those little Maldives shells, which serve as small money in several states of the Indies. Some *Cocos* contain 1000 cauris, others 500, &c.

COCTION, a general name for all alterations made in bodies, by the application of fire, or heat.

There are various species of *Cotion*; as *maturatio*, *frictio*, *elutatio*, *affusio*, *torrefactio*, and *ustio*; which fee in their places, **ASSATION**, **TORREFACTION**, **FRICTION**, &c. see also **CONCOCTION**, and **DECOCTION**.

CODE-FISHERY. See the article **CODE-FISHERY**.

CODE *, **CODEX**, a collection of the laws, and constitutions of the Roman emperors; made by order of Justinian.

* The word comes from the Latin *Codex*, a paper-book; so called a *codicibus*, or *caudicibus arborum*, the trunks of trees; the bark whereof being stripped off, served the ancients to write their books on.

The *Code* is comprized in twelve books, and make the second part of the civil, or Roman law.

There were several other *Codes* before the time of Justinian; all of them collections, or abridgments of the Roman laws. Gregorius and Hermogenes, two lawyers, made each a collection of this kind, called from their names the *Gregorian Code*, and *Hermogenian Code*. These included the constitutions of the emperors from Adrian, to Dioclesian and Maximine, A. D. 306. We have nothing remaining of them but a few fragments; the compilations themselves falling to the ground, for want of authority to put them in execution.

Theodosius the younger was the first emperor who made a *Code*, which was comprized in sixteen books, formed out of the constitutions of the emperors from Constantine the Great to his own time; abrogating all other laws not included in it: and this is what we call the *Theodosian Code*; which was published in the year 438, and received and observed, till annulled by the *Code* of Justinian.

The *Theodosian Code* has been a long time lost in the west: Cujas took a great deal of pains to retrieve it, and to publish it in a better condition than ever. Gothofred has given us a comment on the *Theodosian Code*; a work which cost him thirty years.

In 506, Alaric, king of the Goths, made a new collection of the Roman laws, taken from the three former *Codes*, the *Gregorian*, *Hermogenian*, and *Theodosian*, which he likewise published under the title of the *Theodosian Code*.—This *Code* of Alaric continued a long time in force; and was all the Roman law received into France.

Lastly, the emperor Justinian, finding the authority of the Roman law exceedingly weakened in the west, upon the decline of the empire, resolved to make a general collection of the whole Roman jurisprudence. The management hereof he committed to his chancellor Tribonian; who chose out the most excellent constitutions of the emperors, from Adrian to his own time; and published his work in 528, under the title of the *New Code*.

But because Justinian had made several new decisions, which made some alteration in the ancient jurisprudence; he retrenched some of the constitutions inserted by Tribonianus, and added his own in their place: on which account, he published a new edition of the *Code* in 534, and abrogated the former.

This *Code* of Justinian, as well as the rest of the Roman law, was a long time lost in the west, till the time of Lotharius II. who found it at the taking of Melphi, and gave it to the city of Pisa. This was first re-published by Irnerius, in 1128.

The emperor Frederic, at the request of the universities, appointed it to be taught in the schools; and commanded all his people to observe it. Accordingly, it obtained in Italy and Germany; and still obtains in a part of France, particularly in the southern provinces.

There have been various other later *Codes*, particularly of the ancient Gothic, and since of the French kings; as the *Code* of Euric, the *Code* Michault, *Code* Louis, *Code* Neron, *Code* Henry, *Code* Marchand, *Code* des Eaux, &c. See **CIVIL LAW**.

CODE of Canons, **CODEX Canonum**. See **CANON**.

V O L. I.

CODIA, in botany, is used for the top, or head of any plant; but, by way of eminence, for that of the white poppy: whence the syrup made therewith is called *diacodium*.

CODICIL, a schedule, or supplement to a will, or other writing.

It is used as an addition to a testament, when any thing is omitted which the testator would add, explain, alter, or retract; and is of the same nature as a testament, except that it is without an heir, or executor.

So that a *Codicil* is a less solemn will, of one that dies either testate or intestate, without the appointment of an heir: testate, when he that hath made his *Codicil*, hath either before or afterwards made his testament, on which that *Codicil* depends, or to which it refers. Intestate, when one leaves behind him only a *Codicil* without a testament, wherein he gives legacies only to be paid by the heir at law, and not by any heir instituted by will, or testament.

A *Codicil*, as well as a will, may be either *written* or *nuncupative*. Some authors call a testament, a *great will*, and a *Codicil*, a *little one*; and compare the testament to a ship, and the *Codicil* to the boat tied to it.

But there is this further difference between a *Codicil* and a testament, that a *Codicil* cannot contain the institution of an heir; and that in a *Codicil*, a man is not obliged to observe strictly all the formalities prescribed by law for solemn testaments.

In customary countries, testaments, properly speaking, are no more than *Codicils*; in regard, custom itself names the heir, and does not allow of testamentary inheritors.

Codicils were first brought into use in the time of Augustus by L. Lentulus: they were originally intended to follow the testament; which was, as it were, their basis. In process of time, *Codicils* came to have their effect, even though made before the testament; provided there was nothing in the testament contrary to the *Codicil*.—People were also allowed to make *Codicils* without testaments.

Raym. Lully has a book which he calls *The Codicil*; wherein he pretends to have left his readers the secret of the philosopher's stone; provided they do but understand it.

COECUM, in anatomy, the *blind gut*; the first of the thick intestines; so called, because made like a sack, having but one aperture, which serves it both for entrance and exit.

It is situate on the right side, below the kidney. In children new born, and in quadrupeds, it is found full of excrements; but in adults, &c. it frequently disappears, or only hangs like a worm.

Its use in adults is very obscure: in a foetus, or infant newly born, it appears to serve as a receptacle of the feces during such time as the animal does not discharge by stool.

Dr. Glisson imagines it may likewise serve in such animals as have it large, as dogs, conies, rats, &c. for a kind of second ventricle, or bag, wherein the prepared aliment may be retained, while a richer, and more nutritious juice is drawn from it.

Others will have it contain a ferment, and others, the status of the intestines: others fancy it may separate a humour, by some glands placed therein, wherewith to harden the excrements as they pass through the colon.

Dr. Lister assigns the use of the *Caecum* to be, to keep the excrements which pass into its cavity, (as most of those of found animals he thinks do) till they are sufficiently drained, baked, and hardened, to receive the figure to be given them by the colon and rectum. He adds, to confirm this, that wherever there are regularly figured excrements of the first kind, there is a capacious *Caecum*, and *vice versa*. This indeed is true, that some animals, which are naturally loose, have either no *Caecum* at all, or very little; as the talpa, echinus terrestris, gular, &c. Nature's end, in thus providing for the figuration of the excrements, he takes to be, first, to prevent diarrhaeas; secondly, to make the creature abide hunger the better; (thus it is that snails, in winter, rest with full intestines;) and lastly, to heighten the digestion and fermentation in the stomach and small guts.

Dr. Musgrave gives us an account, in the *Philosophical Transactions*, of the *Caecum* of a dog being cut out, without any prejudice to the animal. M. Giles gives us another, of the *Caecum* of a lady being distended so as to form a tumor, that held almost three chopines of a thin, greyish, and almost liquid substance, whereof the died. And Mr. Knowles, a third, of a boy's *Caecum* being vastly extended and stuffed with cherry-stones, which likewise proved mortal.

Some say, the name, *Caecum*, is mistaken; not allowing this to be the *Caecum* of the ancients, which they imagine to be the thick globous part of the colon, immediately appended to the ileum; and therefore give this part the name of *appendicula vermiformis*.

CO-EFFICIENTS, in algebra, are numbers, or given quantities, prefixed to letters, or unknown quantities, into which they are supposed to be multiplied; and therefore, with such letters, or with the quantities represented by them, make a rectangle or product, *co-efficient productum*; whence the name.

Thus, in $3a$, or bx , or Cxx : 3 is the *co-efficient* of $3a$; b , of bx ; and C of Cxx . If a letter have no number prefixed, it is

is always supposed to have the *Co-efficient*; because every thing is once itself. Thus, *a*, or *b*, or *c*, import as much as *2a*, or *1 b*, or *1 c*.

The *Co-efficient* in a biquadratic equation, is according to its sign, either the sum, or the difference of the two roots. In any equation of an higher nature, the *Co-efficient* of the second term, is always the aggregate of all the roots retaining their proper signs: so that if all the negatives be equal to all the affirmatives, the second term will vanish; and where the second term is thus wanting, it is a sign that the quantities under contrary signs were thus equal.

The *Co-efficient* of the third term is the aggregate of all the rectangles arising by the multiplication of every two of the roots, how many ways soever those combinations of two's can be had; as three times in a cubic, six in a biquadratic equation, &c.

The *Co-efficient* of the fourth term is the aggregate of all the solids made by the continual multiplication of every three of the roots, how often soever such a ternary can be had; as three may be four in a biquadratic, five in an equation of five dimensions, &c. And thus it will go on infinitely.

COELESTIAL Observations, are observations of the phenomena of the heavenly bodies, made with a proper apparatus of astronomical instruments, in order to the determining their places, motions, phases, &c.

The instruments chiefly used in *Celestial Observations*, are the astronomical gnomon, quadrant, micrometer, and telescope; each of which see under its proper head.

Observations in the day-time are easy; in regard the cross hairs in the focus of the object-glass of the telescope are then distinctly perceivable: in the night, those cross hairs are to be illumined to make them visible.

This illumination is either performed by a candle, placed obliquely near them, so as the smoke do not intercept the rays; or where this is inconvenient, by making an aperture in the tube of the telescope, near the focus of the object-glass, thro' which a candle is applied to illumine the cross hairs.

M. de la Hire has made an improvement on the first method, which renders it of very good use; and it is by covering that end of the tube next the object-glass with a piece of gauze, or fine white silken crape. For in such case, a link, placed at a good distance from the tube, so enlightens the gauze, as to render the cross hairs very perceivable.

Observations of the sun, are not to be made without placing a glass, smoked in the flame of a lamp or candle, between the telescope and the eye; to take off from its lustre, which would otherwise damage the eye, were not a good part of its beams intercepted.

Note, when any of the heavenly bodies are observed through a telescope of only two glasses, they appear inverted.

Celestial Observations are chiefly of two kinds; the one when the objects are in the meridian. See **MERIDIAN**.

The other, when they are in vertical circles. See **VERTICAL**.

COELESTIAL Globe. See the article **GLOBE**.

COELIAC Artery, the first artery detached from the descending trunk of the aorta into the abdomen.

It divides into two branches, the one on the right side, the other on the left; of which the first gives the *gastrica dextra*, which goes to the stomach; the *cylica*, which goes to the gall-bladder; the *epiploica dextra* to the omentum; the *intestinalis* to the duodenum, and to a part of the jejunum; and the *gastrico-epiploica* to the stomach, to the omentum, and some branches to the liver, which enter the *capula communis*, to accompany the branches of the *vena porta*.

The left branch of the *Coeliac* gives the *gastrica dextra*, which is also spread upon the stomach; the *epiploica sinistra* which goes to the omentum; and the *splenica* to the substance of the spleen. See each branch described in its place.

COELIAC Passion, is a sort of diarrhoea, or flux of the belly; wherein the aliment comes away either crude or chylified, in lieu of excrements.

Authors frequently confound the *Coeliac* passion with the *lenteria*, but they are different.

There is also a **COELIAC Diabetes**, called *Coeliaca Urinalis*, wherein the chyle passes off along with, or instead of urine. See **DIABETES**.

COELIAC Vein, is that which runs through the intestine rectum. See **RECTUM**.

COELUM. See the article **HEAVEN**.

COELI Fundus. See the article **FUNDUS**.

COELUM is also used by some anatomists for the cavity of the eye towards the angles, or canthi. See **EYE**, **CANTHUS**, &c.

COEMETERIUM *, **CEMETERY**, *Κοιμητήριον*, a dormitory, or sacred place set apart for the burial of the dead.

* Chasler observes, that under *Coemeterium*, *κοιμητήριον*, antiently was comprehended, not only the strict dormitory, or place where the dead were deposited; but all the lands which encompassed the parish churches, and were contiguous to the real churches.—Perhaps it might be added, that all the church domains were comprized under *Coemeterium*. This will best account for that consecration of the *Coemeteries*, charged on Valerian.

In the primitive times, the christians held their meetings in *Coemeteries*; as we are informed by Eusebius, Lib. vii. and by Tertullian, who also calls those *Coemeteria*, where the people used to meet to pray, *areas*. Eusebius adds, that Valerian having confiscated the *Coemeteria*, and places destined for the worship of God, Gallienus restored them by a public rescript, rehearsed by the same author. From these passages it seems as if *Coemeteria*, and places of worship, were used indifferently for the same thing.

The heathen writers frequently upbraid the primitive christians for their meetings in *Coemeteries*; as if they served other purposes besides those of religion. The council of Elvira prohibits the keeping of tapers lighted in *Coemeteria*, during the day-time; and by another canon, the women from passing the night watching in *Coemeteria*.

The custom of blessing *Coemeteries*, is of an old standing: the method was, for the bishop to go round it with his crozier, or pastoral staff, and to sprinkle it with some consecrated fluid. Lobineau says, the holy water-pot was carried before him.

Antiently, all were buried in *Coemeteries*; none in churches. From the bodies of martyrs, &c. being deposited here, the christians chose particularly to build their churches in them, when Constantine gave them the liberty: and hence Tillemont derives that custom which still obtains in the Romish church, never to consecrate any altar, without depositing in it the relics of some martyr.

COENA Domini, *Bull.* See the article **BULL**.

COENOBITE *, a religious who lives in a convent, or in community, under a certain rule; in opposition to Anachoret, or Hermit, who lives in solitude. See **HERMIT**, &c.

* The word comes from the Greek *κοινός*, *communis*; and *βίος*, *vita*, life.

Cassian makes this difference between a *convent* and a *monastery*, that the latter may be applied to the residence of a single religious, or recluse; whereas the *convent* implies *Coenobites*, or numbers of religious living in common.

Fleury speaks of three kinds of monks in Egypt; *Anachorets*, who live in solitude; *Coenobites*, who continue to live in community; and *Sarabaites*, who are a kind of monks-errant, that stroll from place to place.

He refers the institution of *Coenobites* to the times of the apostles, and makes it a kind of imitation of the ordinary lives of the faithful at Jerusalem: Though St. Pachomius is ordinarily owned the institutor of the *Coenobite* life; as being the first who gave a rule to any community.

CO-EQUALITY, a term expressing the relation of equality between two things. See **EQUALITY**.

The retainers to S. Athanasius's doctrine of the trinity, hold the Son and Holy Spirit *co-equal* with the Father. The Arians, &c. deny the *Coequality*. See **TRINITY**, and **ARIAN**.

CO-ETERNITY, is used among divines, to denote the eternity of one being, equal to that of another.

The orthodox hold the second and third persons in the trinity *co-eternal* with the first.

COEUR, in heraldry,—*Party* en **COEUR**, signifies a short line of partition in pale, in the centre of the escutcheon, which extends but a little way, much short of top and bottom; being met by other lines, which form an irregular partition of the escutcheon, as represented in Tab. *Herald.* fig. 43.

CO-EXISTENCE, a term of relation, denoting two, or more things to exist together, at the same time, &c. See **EXISTENCE**.

COFFEE, in natural history, a seed, or berry, brought from Arabia felix; used for the making a drink of the same name. See **DRINK**.

That from the Levant is most esteemed, being greener, heavier, and appearing riper and plumper than that from Mocha; which is larger, lighter, and whiter.

For *Coffee-borries*, some substitute peas, beans, rye, and barley, which roasted, yield an oily matter, resembling in flavour, but less agreeable, as well as much less strong than *Coffee*.

COFFEE also denotes a kind of drink, prepared from these berries; very familiar in Europe for these eighty years, and among the Turks for an hundred and fifty.

Its original is not well known; some ascribe it to the prior of a monastery, who being informed by a goat-herd, that his cattle sometimes browsing on the tree, would wake and caper all night; became curious to prove its virtue: accordingly, he first tried it on his monks, to prevent their sleeping at mattins. Others, from Sehehabeddin, refer the invention of *Coffee* to the Persians; from whom, they say, it was learned in the fifteenth century by Gemaledin, musti of Aden, a city near the mouth of the red sea; and who having tried its virtues himself, and found that it dissipated the fumes which oppressed the head, inspired joy, opened the bowels, and prevented sleep, without being incommoded by it; recommended it first to his servants; with whom he used to spend the night in prayer.

Their example brought *Coffee* into vogue at Aden; the professors of the law, for study, artificers to work, travellers to walk in the night, in fine, every body at Aden drank *Coffee*.—Hence it passed to Mecca, where first the devotees, then the rest of the people took it.—From Arabia felix it passed to Cairo.

In 1511. Khaib Beg prohibited it, from a persuasion that it inebriated, and that it inclined to things forbidden. But sultan Causou immediately after took off the prohibition, and *Coffee* advanced from Egypt to Syria and Constantinople.

The devils declaimed against it from the Alcoran, which declares that coal is not of the number of things created by God for food. Accordingly, the mufti ordered the *Coffee-houses* to be shut up; but his successor, declaring *Coffee* not to be coal, they were opened again.

During the war in Candia, the assemblies of news-mongers making too free with state-affairs, the grand vizier Cuprolî suppressed the *Coffee-houses* at Constantinople; which suppression, though still on foot, does not prevent the publick use of the liquor there. Thevenot, the traveller, was the first who brought it into France; and a Greek servant, called *Pasqua*, brought into England by Mr. Dan. Edwards, a Turkey merchant, in 1652. to make his *Coffee*, first set up the profession of *Coffee-Man*, and introduced the drink among us. Though some say Dr. Harvey had used it before.

The word *Coffee* is originally Arabic: the Turks pronounce it *Cabueh*, and the Arabs *Cabaah*; which some authors maintain to be a general name for any thing that takes away the appetite; others, for any thing that promotes appetite; and others, again, for any thing that gives strength and vigour.

The Mahometans, it is observed, distinguish three kinds of *Cabaah*; the first is wine, or any liquor that inebriates; the second is made of the pods that contain the *Coffee-Berry*; this they call the *Sultana's Coffee*, from their having first introduced it, on account of its heating less than the berry, as well as its keeping the bowels open: the third is that made with the berry itself, which alone is used in Europe, the pods being found improper for transportation. Some Europeans who imported the pods, called them the *Flower of the Coffee-Tree*.

The deep brown colour of the liquor, occasioned its being first called *Syrup of the Indian Mulberry*; under which specious name it first gained ground in Europe.

The preparation of *Coffee* consists in roasting, or giving it a just degree of torrefaction, on an earthen, or metalline plate, till it have acquired a brownish hue, equally deep on all sides: It is then ground in a mill, as much of it as serves the present occasion. A proper quantity of water is next boiled, and the ground *Coffee* put in it. After it has just boiled, it is taken from the fire; and the decoction having stood a-while to settle, and fine, they pour, or decant it into dishes.

The custom is to drink *Coffee* as hot as possible, with sugar; Though the Turks do not trouble themselves to take off its bitterness with any sugar: their grandees add to each dish a drop of essence of ambergrease; others boil with it a couple of cloves; others a little Indian anise; others cacouche, or the grain of the cardamomum minus.—*Coffee* is one of the necessaries which the Turks are obliged to furnish their wives.

The ordinary method of roasting *Coffee* among us, is in a tin cylindrical box, full of holes; through the middle whereof rans a spit: under this is a femicircular hearth, wherein is a large charcoal fire: by help of a jack, the spit turns swift, and so roasts the berries; being now and then taken up to be shaken. When the oil rises, and it is grown of a dark brown colour, it is emptied into two receivers, made with large hoops, whose bottoms are iron plates, these shut into: there the *Coffee* is shaken, and left till almost cold; and if it look bright and oily, it is a sign it is well done.

Coffee is taken with very different nays, frequently with directly opposite, intentions; some use it to prevent sleep, others to promote digestion, &c.—Its more real virtues, owned by the physicians, consist in this; that being an excellent drier, it carries off humors and disorders of the head arising from too much moisture, dissipates megrims, and absorbs acrimonies of the stomach, whence its use after a debauch of strong liquors; and hence also its use in promoting watching, bracing the fibres, and rendering them too tense for the relaxation required in sleep.

It likewise promotes circulation, but that best with people of a pretty corpulent habit; being found hurtful to those who are thin, lean, dry, and of a bilious temperament; as it dries up the nerves, and inclines them to tremors: it is said to be prejudicial likewise to those who digest too fast, where the circulation is too quick, or where there is a spitting of blood arising from the mouths of any of the veins and arteries being too open, or the blood too thin and sharp.

The oily matter that separates from the *Coffee*, and appears on its surface when roasted, and its particular smell which distinguishes it from peas, beans, rye, &c. which some substitute in lieu of *Coffee*, are to be the real indications of its effects. If considered with regard to the oil drawn by the retort, this, as well as that, contains volatile principles, both saline and sulphureous. It is to the dissolution of its salts, and the mixture of its sulphurs in the blood, that its chief faculty of promoting watchfulness is to be attributed: hence also its property of promoting digestion, of precipitating foods, of preventing eruptions, and of correcting acrimonies of the stomach, when taken after meals.

Hence also that fermentation in the blood, serviceable to corpulent people: hence also its diuretick virtue. By experience it is found of service to drink a glass of water before *Coffee*, to ren-

der it laxative; and to mix it with milk, or cream, to extinguish its sulphurs, embarras its saline principles, and render it nourishing.

S. Pauli, a Danish physician, maintains, that it enervates men, and renders them incapable of generation; and it is certain the Turks attribute the same effects to it; and from the immoderate use hereof, account for that thinness of inhabitants found in their provinces formerly the best peopled. But this opinion is refuted by Du Four.—F. Malebranche gave the royal academy of sciences an account of a person cured of an apoplexy, by means of several clysters of *Coffee*.

The tree that produces the *Coffee*, is a kind of Arabic jesslamin: the berry, when ripe, is found as hard as horn; which gave occasion to an opinion, that the people of the kingdom of Yemeri in Arabia felix, where it is cultivated, steeped in boiling water, or baked in a furnace all the *Coffee* they sold abroad, to prevent its growing any where else.

It is said, it yields a revenue of upwards of five millions per annum. Nor will that appear any wonder, when we consider that in London alone, besides the consumption in private houses, some have computed more than three thousand *Coffee-Houses*. In the three kingdoms are yearly expended one hundred tun of *Coffee-Berries*; in England alone seventy: which at 300 l. per ton, a moderate price, amounts to 21000 l. sterling.

COFFER, *Capsa*, in architecture, a square depression, or sinking, in each interval between the modillions of the Corinthian cornice; ordinarily filled up with a rose, sometimes with a pomegranate, or other enrichment.

These sinkings, called also *pannels*, are of different figures in the compartments of vaults and soffits.

COFFER, in fortification, denotes a hollow lodgment, athwart a dry moat, from six to seven foot deep, and from sixteen to eighteen foot broad; the upper part made of pieces of timber raised two foot above the level of the moat; which little elevation has hurdles laden with earth for its covering; and serves as a parapet, with embrasures.

The *Coffer* is nearly the same with the caponiere, abating that this last is sometimes made beyond the counterfearc on the glacis, and the *Coffer* always in the moat, taking up its whole breadth, which the caponiere does not.

It differs from the traverse, and gallery, in that these latter are made by the besiegers, and the *Coffer* by the besieged.

The besieged generally make use of *Coffers* to repulse the besiegers, when they endeavour to pass the ditch.—To save themselves from the fire of these *Coffers*, the besiegers throw up the earth on that side towards the *Coffer*.

COFFERER of the King's Household, a principal officer in the court, next under the comptroller; who, in the computing-house, and elsewhere at other times, has a special charge and oversight of other officers of the house, for their good demeanor and carriage in their offices: to all whom he pays the wages. See HOUSEHOLD.

COGGESHALL'S Sliding-Rule, an instrument used in gauging, so called from its inventor: see the description and use under SLIDING-RULE.

COGITATION, the act or operation of thinking. See THINKING.

COGNATION, in the civil law, the bond of relation between all the descendants from the same stock, both males and females,—by which it is distinguished from *agnation*, which only comprehends the descendants of the male sex.

In France, for the succession to the crown they follow *agnation*; in England, Spain, &c. *Cognition*, women coming to the succession, according to the degree of proximity, in default of males, or their descendants from branch to branch.

In the Roman law, the words *COGNATIO* and *COGNATI* are also taken in a more limited sense; *cognatio* signifying only the bond of relation between the descendants from the same stock by women; and *cognati*, those between whom there was such a bond of relation subsisting.

COGNIZANCE, or COGNISANCE, in heraldry. See CREST.

COGNIZANCE, or CONUSANCE, in law, is the acknowledgment of a fine; or the concession of a thing done.—In which sense, we say, *cognoscens latro*, a thief that confesses.

COGNIZANCE is also used for a power, or jurisdiction. — Thus, *Cognizance of pleas*, denotes an ability to call a plea out of another court; which no one but the king can do, unless he can shew a particular charter for it.

COGNIZANCE is sometimes also used for an audience, or hearing of a matter judicially.—In which sense, we say, *to take Cognizance*, &c.

COGNIZANCE, again, is used for a badge on a waterman's, or serving-man's sleeve, which is commonly the giver's crest, whereby he is discerned to belong to this or that nobleman, or gentleman.

COGNISOR, or CONUSOR, is he that passeth, or acknowledgeth a fine of lands and tenements to another. See FINE, and COGNIZANCE.

CO-HABITATION, implies a concubinage, or a copulation, or carnal knowledge between two persons: it is rarely used, except in a criminal sense.

COH

CO-HEIR, a person who shares an inheritance or estate with another. See **HEIR**.

COHERENCE, a school-term, applied to propositions, discourses, &c. which have a connection, or dependance on one another. See **CONNECTION**, &c.

COHESION, or **COHÆSION**, in physics, the action whereby the particles, or primary corpuscles whereof natural bodies consist, are connected, or bound together, so as to form particles; and those, again, kept together, so as to form sensible masses, or bodies.

The cause of this *Cohesion*, or nexus materize, has extremely perplexed the philosophers of all ages. In all the systems of physics, matter is supposed originally to be in minute, indivisible atoms.

How, and by what principle these several and distinct corpuscles should come first joined and combined into little systems; and how they should come to persevere in that state of union; is a point of the most difficulty, and even of the most importance of any in physics!

The most popular opinion, is that so strenuously defended by J. Bernoulli de *gravitate Aetheris*; who accounts for the *Cohesion* of the parts of matter, from the uniform pressure of the atmosphere: confirming this doctrine from the known experiment of two polished marble planes, which cohere very strongly in the open air, but easily drop asunder in an exhausted receiver.

But though this theory might serve tolerably well to explain the *Cohesion* of compositions, or greater collections of matter; yet it falls short of accounting for that first *Cohesion* of the atoms, or primitive corpuscles, whereof the corpuscles of hard bodies are composed.

Sir Isaac Newton delivers his doctrine of *Cohesion* thus: 'The particles of all hard, homogeneous bodies which touch one another, *cohere* with a great force; to account for which, some philosophers have recourse to a kind of hooked atoms, which, in effect, is nothing else but to beg the thing in question. Others imagine, that the particles of bodies are connected by rest, i. e. in effect, by nothing at all; and others by conspiring motions, i. e. by a relative rest among themselves. For myself, it rather appears to me, that the particles of bodies *cohere* by an attractive force, whereby they tend mutually toward each other: which force, in the very point of contact, is very great; at little distances is less; and at a little farther distance is quite insensible.

Now, if compound bodies be so hard, as by experience we find some of them to be, and yet have a great many hidden pores within them, and consist of parts only laid together; no doubt those simple particles which have no pores within them, and which were never divided into parts, must be vastly harder. For such hard particles gathered into a mass, cannot possibly touch in more than a few points: and therefore much less force is required to sever them, than to break a solid particle whose parts touch throughout all their surfaces, without any intermediate pores or interstices. But how such hard particles, only laid together, and touching only in a few points, should come to *cohere* so firmly as in fact we find they do, is inconceivable; unless there be some cause, whereby they are attracted and pressed together.

Now, the smallest particles of matter may *cohere* by the strongest attractions, and constitute larger, whose attractive force is feebler: and, again, many of these larger particles *cohering*, may constitute others still larger, whose attractive force is still weaker; and so on for several successions, till the progression end in the biggest particles, on which the operations in chymistry, and the colours of natural bodies do depend; and which by *cohering* compose bodies of a sensible magnitude.'

The different degrees of *Cohesion*, constitute bodies of different forms and properties.—Thus, the same great author observes, the particles of fluids which do not *cohere* too strongly, and are small enough to render them susceptible of those agitations which keep liquors in a fluid, are most easily separated and rarefied into vapour, and make what the chymists call *volatile bodies*; rarefying with an easy heat, and again condensing with a moderate cold.

Those whose particles are grosser, and so are less susceptible of agitation, or *cohere* by a stronger attraction, are not separable without a greater degree of heat; and some of them not without fermentation: and these make what the chymists call *fixed bodies*.

COHOBATION, in chymistry, a repeated distillation of the same matter, with the liquor drawn from it; that liquor being again and again returned upon the matter left at the bottom.

The design of this operation is to open the pores, and separate, and volatilize the spirituous part.

Cohobation is a kind of circulation; only differing from it in this, that the liquor is drawn off in *Cohobation* as in common distillation, and thrown back again; whereas in circulation it rises and falls in the same vessel, without ever being carried out. See **CIRCULATION**.

COHORT, **COHORS**, among the Romans, a body of infantry,

COI

consisting of five or six hundred men; answering in most respects to our battalion. See **BATTALION**.

The *Cohort* was divided into three maniples, or companies; the maniple into two centuries; and the century into an hundred men.

The first century in the first *Cohort* was called *primipilus*; and had the charge of the eagle, or standard of the legion.—A legion consisted of ten *Cohorts*.

When the army was ranged in order of battle, the *Cohorts* were disposed in the following manner: the first *Cohort* took up the right of the first line, as the companies of grenadiers do in our regiments; the rest followed in their natural order; so that the third was in the center of the first line of the legion, and the fifth on the left: the second between the first and third; and the fourth between the third and fifth. The five remaining *Cohorts* formed a second line in their natural order: thus the sixth was behind the first, and so of the rest.

The first, third, and fifth *Cohorts* were esteemed the best; at least it appears so from the posts they took up, which were looked on by the Romans as the most important.

Marius is by some said to have been the first who divided the Roman forces into *Cohorts*: which opinion seems confirmed by Rofinus; *Nem enim in tota Livii historia cohortum sit mentio. Idcirco datū viri sentiunt a G. Mario primum cohortes esse institutas.* Rofin. Corp. Antiq. l. 10. c. 5. But yet this is a great mistake; for the *Cohorts* are often mentioned in Livy, and particularly l. 27. c. 13. *Marcellus—Cohortibus que signa amiserant bordeum dari jussit: Centurionesq; manipulorum quorum signa amissa fuerant distribuit gladiis distinctis destituit.*— This happened A. U. C. 543. and consequently, several years before Marius was born.

COIF, the badge of a serjeant at law; who is hence also called *serjeant of the COIF*. See **SERGEANT**.

The *Coif* is of lawn, and is worn on the head, under the cap, when they are created, and ever after.

The use of the *Coif* was to cover the *tonsura clericali*, or clerical crown; because the crown of the head was originally close shaved, and only a border of hair left around the lower part, which gave it the appearance of a crown. See **CROWN**, **TONSURE**, &c.

COIN, *Monetrix*, in the manufacture of money, medals, and counters, is a piece of steel well tempered, four or five inches deep, square at bottom, and round a-top; whereon are engraved, dent-wile, with punchions and other instruments, the several figures, marks, &c. to be struck on the monies, &c.

For the manner of engraving COINS. See **ENGRAVING on steel**.

COIN is more generally used for a piece of metal, converted into money, by the impressing of certain marks or figures thereon.

Coin may be defined, a species of money, struck either with a hammer, or mill.

Hence, *Coin* differs from money, as the species does from the genus. Money is any matter, whether metal, wood, leather, glass, horn, paper, fruits, shells, or kernels, which have course as a medium in commerce.

Coins are a particular branch of monies, viz. such as are made of metal, gold, silver, or copper, and struck according to a certain process, called *coinage*.

It is observed, under the article **MONEY**, that the precise epocha of the invention of money is not known; it is too antient for our annals: and if we might argue from the necessity and obviousness of the thing, it must be nearly coeval with the world.

Whether *Coins* be of equal antiquity, may admit of some doubt; especially as most of the antient writers are so frequent and express in their mention of leathern-monies, paper-monies, wooden monies, &c. Some, however, notwithstanding all this, are of opinion that the first monies were of metal: the reasons they give, are the firmness, neatness, cleanliness, durability, and universality of metals; which, however, do rather conclude, that they ought to have been so, than they actually were so.

In effect, the very commodities themselves were the first monies, i. e. they were current for one another by way of exchange; and it was the difficulty of cutting, or dividing certain commodities, and the impossibility of doing it without great loss, that first put men on the expedient of a general medium.

Indeed, thus much may be said in behalf of *Coins*, that, on this view, it was natural for men to have their first recourse to metals; as being almost the only things whose goodness, and as it were integrity, is not diminished by partition; besides the advantages above expressed, and the conveniences of melting, and returning them again into a mass of any size or weight.

It was probably, then, this property of metals which first accustomed people, who trafficked together, to account them in lieu of quantities of other merchandises in their exchanges; and at length to substitute them wholly in their stead: and thus arose money: as it was their other property to preserve any mark or impression a long time, which confirmed them in the right; and thus was the first use of *Coins*.

In the first ages, each person cut his metal into pieces of different sizes and forms, according to the quantity to be given for any merchandize, or according to the demand of the seller, or the quantity stipulated between them: to this end they went to market, laden with metal, in proportion to the purchase to be made, and furnished with instruments for portioning it, and with scales for dealing it out, according as occasion required.

By degrees it was found more commodious to have pieces ready weighed; and as there were different weights required, according to the value of the different wares, all those of the same weight began to be distinguished with the same mark, or figure: thus were Coins carried one step further.

At length, the growing commerce of money beginning to be disturbed with frauds, both in the weights and the matter, the publick authority interposed; and hence arose the first stamps or impressions of money; to which succeeded the names of the monies; and at length the effigy of the prince, the date, legend, and other precautions to prevent the alterations of the species: and thus were Coins completed.

On the foot whereon money now stands, it is divided into real, or effective money; and imaginary money, or money of account.

Modern COINS, or Species current in Europe, Asia, Africa, and America.—All the current species in the four quarters of the earth, at this day, are either made of metals, or they are shells, and fruits.

The metals are gold, silver, copper, tin, and lead; to which may be added billon, a mixture of silver and copper in a certain proportion.

In Europe none are used beside gold, silver, copper, and billon.

In some parts of the East-Indies, they likewise use tin and lead: as to shells and fruits, they are the small money of several nations in Asia, Africa, and America.

British COINS.—In England, the current species of gold, are the guinea, half-guinea, jacobus, laureat, angel, and rose-noble: the four last of which are now seldom met with, having been most of them converted into guineas, chiefly during the reign of Charles II. and James II.

The silver Coins are the crown, half-crown, shilling, and sixpence. The Copper Coins are the half-penny and farthing.

Value and Proportions of the English COINS.

Farthing.

2	Halfpenny.
48	24 Shilling.
120	60 2½ Half Crown.
240	120 5 2 Crown.
900	180 20 8 4 Pound Ac.
10.8	50 4 21 8½ & 4½ 1½ Guinea, or piece.

The Jacobus 25 10 5 1½
The Carolus or Laureat } 23 9½ 4½ & 1½

In Scotland, by the articles of the union, it is appointed, that all the Coins be reduced to the English, and the same accounts observed throughout. Till then the Scots had their pounds, shillings, and pence, as in England; but their pound was but twenty pence English, and the others were in proportion: accordingly, their mark was 13½ s. Scotch, current in England at 13½ d. their noble in proportion.

Beside these, they had their Turnor pence, and half-pence; their penny, ⅔ of that of England: besides base money of Achifons, Babees, and Placks. The Bodle, ½ of the penny, ⅓ of the Achifon, ⅔ of the Babee, and ⅓ of the Plack.

In Ireland, the Coins are as in England, viz. shillings, pence, &c. with this difference, that their shilling, or harper, is but equal to nine pence sterling; whence their pound is only ⅔ of ours, or 15 s.

French COINS.—The only gold Coin now current in France, is the lewidore, or Louis d'Or, with its divisions, which are ½ and ¼; and its multiples, which are the double and quadruple Louis.—Till the year 1700, they had gold lys, and ecus, or crowns; but they are now no more.

The silver Coins are the ecus, crown, or white louis's, with their diminutions, viz. ½ and ¼; and pieces of ten sols, and of fix. See SOL, and CROWN.

The Billon Coins are of two kinds, each called solz; some of 15 deniers, other of 21. To these may be added some deniers current in the Lioinois, Provence, Dauphine, and other parts. Lastly, the copper Coin is the liard, equal to three deniers; and is ordinarily called the double.

Value and Proportion of the French COINS.

Dernier, equal to ⅓ of a Farthing sterling.

2	Double				
3	1½ Liard.				
12	6	4	Sol Paris, is equal to		l. s. d.
240	120	8	20 Livre, Acc.		0 : 0 : 0 : ½
720	360	240	60 3 Ecu, Crown.		0 : 0 : 10 : ½
					0 : 2 : 7 : ½

The louis d'or, or French pistole, was first struck at 10 livres, but has since risen as high as 30. With us it is valued at 16 s. sterling.

Spanish COINS.—In Spain, and the states depending thereon, the gold Coin is the pistole; above which is the double pistole, and piece of four pistoles; and under it the half pistole: to which must be added the castillans of gold. See PISTOLE.

The silver money are the piastra, or piece of eight rials, and its diminutions; as also the simple rial, with its diminution. See RIAL.

The copper Coins are the ochavos, or octavos, which are of two kinds, the one equal to four maravedis, and ordinarily called quarta; the other double this, and called double quarta: lastly, the maravedis. See MARAVEDIS.

It must be observed, that in Spain they have new money and old. The old, current in Sevil, Cadix, Andalusia, and some other places, is worth 25 per Cent. more than the new, current at Madrid, Bilbao, St. Sebastian, &c. i. e. 100 pounds old, is equal to 125 pounds new. This difference is owing to their king Charles II. who in 1688, to prevent the export of money abroad, raised it 25 per Cent. which, however he was only able to effect in part; several provinces still retaining the antient rate.

Value and Proportion of the Spanish COINS.

Maravedis old, nearly equal to half a farthing sterling.

4	Quarta:				
8	2	Octavo, or double Quarta.			l. s. d.
64	3½	4½ Real, old plata, equal to			0 : 0 : 6 : ½
512	68	34 8 Pieces of Eight, or Piastra			0 : 4 : 6
2048	272	136 32 4 Pistole,			0 : 17 : 6

Portuguese COINS.—Those of gold are the millera, or St. Stephen, and the moeda d'oro, or, as we call it, the moire; which is properly their pistole: above this are doppio moedas, or double pistoles; and quadruple species equal to five pistoles. See MOIRE, DOUBLOON, &c.

Their silver Coins are the cruzada, pataca, or piece of eight; and the vintem, whereof they have two sorts, the one silver, and the other billon.

The ree is of copper, which serves them in accounts, as the maravedis does the Spaniards.

Res, or Rez, equal to ⅓ of a farthing sterling.

20	Vintem				
400	20	Cruzada.			l. s. d.
1000	50	2½ Mi-moeda, or half pistole, equals			0 : 13 : 6
2000	100	5 2 Moeda d'oro, or pistole,			1 : 7 : 0
4000	200	10 4 2 Doppio moeda, or double pist.			2 : 14 : 0
10000	500	25 10 6 2½ Ducat of fine gold,			6 : 15 : 0

Dutch COINS.—Those of silver are crowns, or dollars, daucatoons, florins, and shillings, each whereof has its diminution. The silver, or common shilling, is of billon, the duy, and penny, of copper.

Penny.

1	Duyt.				
6	4	Gros:			l. s. d.

236	160	40 20 3½ Florin or gilder,			0 : 2 : 0
708	480	120 60 10 3 Dollar, or ducatoon,			0 : 6 : 0

Flemish COINS.—Those of gold are imperials, rides, or philips, alberts, and crowns.

Those of silver are philips, rixdollars, patagons, sealines, and gulden: and those of copper, patards.

Patard, or penny.

8	Groat.	l. s. d.
16	Single stiver, equal to	o : o : 1½
96	6 Shilling,	o : o : 7½
288	18 Gulden,	o : 2 : 0
720	90 Rixdollar, dollar, patag.	o : 4 : 6
2104	71 Imperial.	o : 11 : 3

Note, The rixdollar, dollar, and patagon, are nearly on the same foot with the crown, or piece of eight.

German COINS.—Those of gold are ducats, which are of various kinds; oboli of the Rhine, and florins: of this last kind there are some likewise of silver; beside rixdollars and izelottes, which are all of that metal.

Those of copper, are the creux, or kreutzer, and senin.

Senin, equal to ½ of a farthing sterling.

8	Creux, or kreutzer.	l. s. d.
102	1 Dollar.	o : 2 : 9
3, 8	1 Obolus.	o : 3 : 0
432	53 1/2 izelotte.	o : 4 : 6
480	60 1/2 Gulden, or florin.	o : 7 : 6
600	100 1/2 Rixdol. or dollar.	
1, 608	132 1/2 Ducat.	

Italian COINS.—In Italy, the several states have several current monies: though there are some common to them all; such as the pistole of gold, and the ducatoon and florin of silver; which being of various weights, fineness, and value; see under the articles PISTOLE, DUCATOON, &c.

Those peculiar to Rome, are the julios of silver, the pignatelle of billon; and the bayoco, demi-bayocos, and quadrine of copper.—Venice has its sequins of gold; its justins, or ducatoons, and derlingues of silver.—Naples its carlins.—Mourgues its monacos, or crowns, and its louis's of six sols.—Genoa its croifats. Savoy and Piedmont, its lys; all silver. This last state has likewise papiroles, and caveats of billon.

s. d. Ster.

Julio, equal to ———— o : 6 2/3 } 8 1/2 make a French crown.
 Bayoco, 1/7 of the julio = o : o 1 penny and 1/2.
 Pignatelle, 1/10 of the julio = o : o 2 1/2 of a penny, or near 1/4 a farthing sterling.

Justine	=	4 : 9
Derlingue, 1/2 of the justine	=	1 : 2 1/2
Carlin	=	o : 6
Monaco	=	4 : 4
Sequin	=	9 : 2
Croifats	=	4 : 4

Swiss COINS, are ratzes, and blazes; of Billon.—The ratze, equal to 1/4 and 1/5 of a penny sterling.—Blaze of Bern, nearly on the same footing with the ratze.

Polish COINS.—Beside the rixdollars struck here, which are common to other countries; the Poles strike silver rous, abras, and groats.

Rous	=	o : 4 1/2
Abras	=	o : o 1/2
Groch	=	o : o 1/4 and 1/2

Danish COINS, are the horse, the marc lubs, and the schefdal of silver.

Horse	=	1 : 1 1/2
Marc lubs	=	1 : 6
Schefdal, two marcs, or lubs	=	3

Swedish COINS.—Those of silver are the christines, carolines, and cavaliers. Those of copper the roustique, alleuvre, mark and money.

Christine	=	1 : 1 1/2
Caroline	=	1 : 5 1/2
Mark	=	o : 2 1/2
Roustique, 1/3 of the mark	=	o : o 1/2 and 1/3 of 1/2
Alleuvre, 1/2 of the roustique	=	o : o 1/2 and 1/3 of 1/2

The Swedish money, properly so called, is a kind of copper, very soft and malleable, cut in little square pieces, or plates, about the thickness of three English crowns, and weighing five pounds and a half; stamped at the four corners with the Swedish arms; and current in Sweden for a rixdollar, or piece of eight.

Muscovite COINS.—There are two kinds of copecs in Muscovy, the one of gold, the other of silver; the last called also denaings, or pence. Their

Copec, or kapeke of gold, worth 1 : 6 1/2 Sterl. but current in the Czar's territories for	1 : 9
Copec of silver, or denaings of an oval form, worth	o : 1 1/2 Sterl. but current for somewhat more.
Polusk, 1/2 of the copec	o : o 1/2
Mostofiske, 1/4 of the copec	o : o 1/4

Turkish COINS.—The only gold species struck in the grand seignior's territories, is the sultanin, called also the scheriff, or sequin. Their small monies are the para, paraft, called also parat, and the meidein, and the aspre, both of silver.

Sultanin scheriff, or sequin, equal to the ducat of gold, or	9 : o
Para parat, or paraft	o : 1 1/2
Shakee of Aleppo and Scanderoun	o : 3 1/2
Aspre	o : o 1/2 but ordinarily, by reason of the base alloy, no more than 1/2

COINS of the coasts of Barbary.—The current Coins struck here are rubies, medians, zians, and metecals; these are all of gold: the last of which are struck at Morocco, the rest at Fez, Algiers, and Tunis; which beside have doubas of silver, and burbas of copper.—Tunis, has its nafaras of silver, its blanquilles likewise of silver, and its felours of copper.

Other Coins of Africa, are the merigal of gold, current in Sofala, and the kingdom of Monopotapa; and the pardo of silver, current in Mosambica.

Rubie, equal to 35 aspres, or	1 : 9
Menian, 50 aspres, or	2 : 7
Ziam, zian, or dian, two menians, or	5 : 2

Metecal a kind of ducat of different fineness, consequently of different value; whence very considerable difficulties in commerce. The difference arises hence, that there is no mint fixed, or regular coiners at Morocco, but every Jew and goldsmith strikes ducats after his own manner in open shop.

Double, equal to 80 aspres, or	4 : 6 Sterl.
Burba, 1/2 of an aspre, or	o : o 1/2
Blanquille, 1/4 of the aspre, or	o : 2 1/2
Felours, 1/2 of the blanquille, or	o : o 1/2 and 1/4
Merigal, worth about	18 : o
Pardo, worth about	1 : 3

Persian COINS.—These are either silver, or copper; gold they have none: of the first kind are the abassi, mamoudi, shabee, and bifti: of the second the kabefqui, and half kabefqui; the tela, or cherafis indeed is gold; but it is less a money than a medal, though it has some course in commerce.

Abassi, equal to	1 : 4 1/2
Mamodi, 1/2 the abassi	o : 8 1/2
Shabee, 1/2 the mamodi,	o : 4 and 1/2
Bifti, some relations make a Coin worth about one penny half-penny; but others only a term of accompt, signifying 10 dimars, or 1/10 part of a toman. See TOMAN.	
Casbequi, or cabefqui, equals 1/2 of a penny sterling.—Tela, or cherafis, usually struck at the accession of a new king, and at the beginning of each new year; its weight and worth various.	

Chinese COINS.—Throughout the kingdom of China and Tonquin, there are not properly any Coins struck; instead of these, they cut their gold and silver into little pieces of different weights: those of gold, the Dutch, from their figure, which resembles a boat, call *golchuts*: those of silver, the natives call *leam*; the Portuguese, *taels*.—Their small money is of copper; ten of these pieces make their shilling, and ten of those their crown, or leam. Beside these, they have a small money of lead, mixed with the scum of copper, having holes in the middle to string them on for the ease of numbering: this species is called *caxa*, *cas*, and *pitis*; and the string, which usually holds 200, is called *fanta*. They are so very brittle, that they never fall without breaking into a great number of pieces; and if left all night in salt water, they stick so close together that they cannot be separated.

There are two kinds of golchuts, great and small.—Golchut, an ingot, which at 3 l. 3 s. per ounce, usually amounts to 101 l. 5 s. sterling.—Other golchuts only weigh half as much; their value is in proportion.

Tael, or leam, equal to 6 s. 8 d. sterling.
 Copper money 1/10 part of the tael, or somewhat more than 1/4 of a farthing.

Caxa, cas, or pitis, 1/3 of a farthing sterling, 300000 of these are nearly equal to 56 Dutch livres.

Coins of Japan.—The Japonese strike coupants, both of gold and silver, and copper pieces with holes in the middle, like those of China; six hundred of these make the tael. Their other monies, or quasi monies, are ingots, which they cut like the Chinese of

of different weights, chiefly three; the largest of the weight of six rials, viz. forty-eight taels, the tael equivalent to seventy-five Dutch flyers. The second equal to six taels and an half; and the third to $\frac{1}{2}$ of a rial, or one tael $\frac{1}{2}$.
Beside these, they have a small silver money, in form of round beans, of no determinate weight, but usually weighed by maifes; the common payment being by ten maifes, which make one tael.

l. s. d. Sterling.

Coupant of gold, weighing one ounce six drachms; its figure a long oval, the longest diameter about four inches, and the shortest half an inch.

Other coupants of gold, near $\frac{1}{2}$ of the former, amounting to about

Coupant of silver, current at

Copper money, ———— $\frac{1}{4}$ of a farthing.

COINS of Siam.—In the dominions of Siam are struck gold pieces five or six grains heavier than the half pistole of Spain; but these are rather pieces of curiosity, than of use in commerce.

Their silver *Coin* is the tical, or baat; the diminutions whereof are the mayon, or feling, foang, and fompayc. These pieces are all strangely struck: in form they resemble nuts, a little flattened at the extremities; and are some of them cloven like horse-shoes: on two of the sides there are some Siamese letters.—Their copper money, called bia, is round and thick: beneath this is the cauris.

l. s. d. Sterl.

Gold species of Siam, ———— 7 : 0

Tayl, ———— 6 : 11 $\frac{1}{2}$

Mayam, or mafs $\frac{1}{2}$ of the tayl, ———— 0 : 5 $\frac{1}{2}$ and $\frac{1}{2}$

Foang, $\frac{1}{2}$ the mayam, ———— 0 : 2 $\frac{1}{2}$

Sompayc, $\frac{1}{2}$ the foang, ———— 0 : 1 $\frac{1}{2}$ and $\frac{1}{4}$

Copper *Coin*, or farthing of Siam, ———— 0 : 0 $\frac{1}{4}$

COINS of the *Coasts* and *Islands* of the Indies.—The principal, and those most generally current, are pagodos, rupees, larins, fanos, or fanons, and coupans, each whereof are struck both of gold and silver.

Beside these general *Coins*, there also are particular ones, viz. at Goa, S. Thomas's of gold.—Along the Persian gulf, about Mecca, and throughout Arabia, the larin.—Along the coasts of Malabar, and at Goa, the pardao and xeraphin of silver.—At Bantam, the fardos; at Malabar, the tare; at Siam the tayl, with its diminutions the mayam, foang, fompayc, and demi-foang: all of silver.—At Surat, Agra, and the rest of Indostan, the pecha, or pella, and doudous, all of copper.—The bafarucos and chedas, of tin.

l. s. d. Sterl.

Pagodo, gold, denominated from its impression, an Indian idol,

Pagodo, silver, its value very different; the smallest eight tangas, and the tanga ninety bafarucos; equal to

Rupee, gold, ———— 1 : 11 : 6

Rupee, silver, its fineness and value various: there are three kinds current, viz. the rupees Siceas, the rupees of Surat, and rupees of Madras.

l. s. d. Sterl.

Rupees Siceas, worth at Bengal ———— 2 : 11

— of Surat ———— 2 : 3

— of Madras ———— 2 : 5 $\frac{1}{2}$

Note, This is to be understood of the new rupees; for as to the old ones, of each kind, their value is less: those of Madras, v. gr. are but equal to 11 s. 11 d. Sterling, those of Surat 2 s. and the Siceas 2 s. 4 d.

Larin, in form of a round wire, or cylinder, equal to the barrel of a pen; bent in two, and a little flattened at each end, to receive the impression of some Arabic, or Persian characters.

l. s. d. Sterl.

Fanos, or fanon, gold, is of different fineness, weight, and value; the largest worth

The smallest ———— 0 : 2 $\frac{1}{2}$

Fanos, silver, ———— 0 : 1 $\frac{1}{2}$

Bafarucos or Budgerooks, $\frac{1}{2}$ of a farthing.

Cheda is of two kinds, the one octagonal

current at ———— 0 : 1 $\frac{1}{2}$

The other round ———— 0 : 0 $\frac{1}{2}$

Mogul COINS.—In the dominions of the great Mogul, are roupies, mamoudas, and pechas; the first both of gold and silver; the second of silver alone, and the third of copper.

There are others struck by the princes tributary to him, and the powers bordering on him, but these are scarce current beyond their respective territories: particularly a small silver *Coin* struck by the king of Matoucha, whose territories lie to the north of Agra, of the value of the pecha of Mogul, but half as heavy a-

gain.—The Raja of Parta-jajamoula, to the north of Patua, likewise strikes some little pieces, both of silver and copper, of small value.—The Raja of Ogden, who commands between Brampour, Seronge, and Amadabath, a small silver *Coin*, equal to sixpence sterling; and another of copper, equal to an half-penny sterling.—The king of Cheda and Pera, a tin-money called *cheda*.—The king of Achem, little flight gold pieces, worth about fifteen pence sterling.—And tin pieces, eighty of which are equal to the English penny, current in the isles of Sumatra.—The gold *Coin* of the king of Macassar and Celebes, is taken by the Dutch for a florin.—The kings of Camboja strikes only pieces of silver and copper: his gold, wherein he abounds, is negotiated by weight.—The king of Java and Bantam, in the same island, and those of the Molucca islands, strike only copper *Coins*: they allow foreign silver species to be current in their territories, but they coin none.

l. s. d. Sterl.

Roupia, see COINS of the *Coasts*, &c. of India.

Mamouda, or mamotha, its value is not fixed: in the kingdom of Mazarat, the great mamouda is equal to

The small, half the great one ———— 0 : 11

Pecha, see COINS of the *Isles*, &c. of India.

Silver piece of Matoucha ———— 0 : 5 $\frac{1}{2}$

Silver piece of the king of Ogden, ———— 0 : 6

Copper piece of the same ———— 0 : 0 $\frac{1}{2}$

Cheda, see COINS of the *Isles*, &c. of India.

Gold piece of the king of Achem, ———— 1 : 3

Tin piece of the same ———— 0 : 0 $\frac{1}{2}$

Gold piece of the king of Macassar, taken

by the Dutch for a guilder, ———— 1 : 10 $\frac{1}{2}$

To the number of current *Coins* which have distinct names to specify them, may be added many more, both in Europe and Asia, only denominated and known from their value: such are those called simply *pieces*, with the addition of their price; as in Spain, the piece of eight rials, in England the piece of twenty-one shillings, or guinea; in France the piece of four francs, piece of ten sols, or shillings; piece of four sols; piece of two sols; of six francs, of 30, 15, 6, 4, &c. deniers, or pence. See *PIECE*.

Shells current for COINS.—These serve in many places for money; and are brought from the Maldives, and called in the Indies *cowries*: on the coasts of Africa they change their name, and are called *benjes*.

In America they take a third name, viz. *porcelains*. Indeed these last do not come from the Maldives; there being shells found in the West-Indies much like those of the East.

In the kingdom of Congo there is another kind of shells, called *zimbi*; though some will have them the same with the cowries. Cowrie, coris, or bouges, are white shells, current particularly in the states of the great Mogul; sixty-five are usually reckoned equivalent to the ponce, a small copper *Coin*, worth about an halfpenny sterling; which brings each cowry to $\frac{1}{3}$ of a penny sterling.

Porcelains are nearly on the same footing with the cowries. See PORCELAIN.

Zimbi, current particularly in the kingdoms of Angola and Congo. Two thousand zimbis make what the negroes call a *maciute* or *macoute*; which is no real money, whereof there is none in this part of Africa, but only a manner of reckoning: thus, two Flemish knives they esteem a *macoute*; a copper balon, two pound weight, and twelve inches diameter, three *macoutes*; a fufy ten, &c.

Fruits current for COINS.—There are three kinds of fruits used for *Coins*; two in America, particularly among the Mexicans; which are the cacao and maife: the other in the East-Indies, viz. almonds; brought thither from Lar, and growing in the deserts of Arabia.

Cacao, fifteen of these are esteemed equivalent to a Spanish rial, or seven pence sterling. See CACAO.

Maife has ceased to be a common money since the discovery of America by the Europeans.

Almonds are chiefly used where the cauris are not current. As the year proves more or less favourable to this fruit, the value of the money is higher or lower: in a common year, forty almonds are set against a pecha, or half-penny sterling; which brings each almond to $\frac{1}{4}$ of a farthing.

Antient COINS are those chiefly which have been current among the Greeks, Jews and Romans.

For Jewish COINS, their Values and Proportion stand thus:

Gerah	l.	s.	d. Sterl.
10 Bekah	00	00	1 $\frac{1}{2}$ $\frac{1}{2}$

			Victoriatius	}	0 : 3 : 3 $\frac{1}{2}$
40	20	10	4		2
					0 : 7 : 3

Note. Of these the denarius, victoriatius, seftertius, and sometimes the as, were of silver, the rest of brass.

There were sometimes also coined of brass the triens, sextans, uncia, sextula, and dupondius.

The Roman gold Coin was the aureus, which weighed generally double the denarius; the value of which, according to the first proportion of coinage, mentioned by Pliny, was —

According to the proportion that obtains now amongst us, worth —

According to the decuple proportion, mentioned by Livy and Julius Pollux, worth —

According to the proportion mentioned by Tacitus, and which afterwards obtained, whereby the aureus exchanged for 25 denarii, its value —

COIN, in architecture, a kind of dye, cut diagonal-wise, after the manner of the flight of a staircase; serving at bottom to support columns in a level; and at top to correct the inclination of an entablature, supporting a vault.

These Coins have also the same effect with round balusters, which are not inclined according to any flight.

COIN is also used for a solid angle, composed of two surfaces inclined towards each other; whether that angle be exterior, as the Coin of a wall, a tree, &c. or interior, as the Coin of a chamber, or chimney: from the word *cuneus*, wedge. See QUOIN.

COINAGE, or COINING, the art, or act of making money. *Coining*, is either performed by the hammer or the mill.—The first method is now little used in Europe, especially in England, France, &c. though the only one known till the year 1553, when a new machine, or *coining mill*, was invented by an engraver, one Antoine Brucher, was first tried in the French

king's palace at Paris, for the *coining* of counters. Though some attribute the invention of the mill to Varin, a famous engraver, who, in reality, was no more than an improver of it; and others to Aubry Olivier, who had only the inspection of it.

The mill has met with various fate since its first invention; being now used, and again laid by, and the hammer resumed: but it has at length got that footing, by the neatness and perfection of the species struck with it, that there appears no great probability of its ever being again disused. See MILL.

In either kind of *coining*, the pieces of metal are stamped, or struck with a kind of punchions or dyes, wherein are engraven the prince's effigies, with the arms, legend, &c. The manner of preparing and cutting of which, see under ENGRAVING.

The first operations in *Coining* are the mixing, and melting of the metal.—For the first, it is to be observed, that there are no species coined of pure gold or silver, but always a quantity of alloy of copper is mixed with them: the reasons are partly the scarcity of those two metals, partly the necessity of making them harder by some foreign admixture; and partly to defray the expences of *Coining*.

Now there are two kinds of alloying, or mixing: the first where the gold or silver has not been used for money before; the other, where several kinds of species, or ingots of different standards and values, are to be melted down into a new money. The proportioning of the alloy with the fine metal is easy in the first case, in the other it is more difficult: the arithmeticians make a long doctrine of it, which see under ALLIGATION.

Yet it is readily effected by the following method, taken from the anonymous author of the treatise at the end of that of Mr. Boissard, viz.

Write down the several matters to be melted, their quality, weight, and fineness, in two distinct articles; the one containing those above the standard, the other those under it: by casting up the first, you shall have the excess, by the latter, the defect. Then comparing the two sums, you will find, by subtraction, how much alloy must be added to bring the several matters to the fineness required.

For the melting, if the metal be gold, it is done in earthen crucibles; if silver or copper, in pots or crucibles of iron.

There are two kinds of furnaces proper for the melting of the metals; those with only a draught of wind, and those with bellows. See each explained under the article FURNACE.

When the gold or silver are in balneo, i. e. are entirely melted, they are to be stirred and brewed together; the silver and copper with an iron stirrer, the gold with one of baked earth. In this state they are poured into moulds, or frames, for casting them into long flat bars: the method of doing which, is exactly the same with that used by the founders, in sand; both with regard to the frames, the manner of working the earth, and that of ranging the models or patterns.

The models are flat plates of copper, about fifteen inches long, and nearly of the thickness of the species to be struck. In each mould are placed eight of these to make bars or plates for guineas, ten for half guineas, five for crowns, &c. and in proportion for copper. All the difference between casting the bars of gold, and those of the other metals consisting in this; that the latter are taken out of the crucibles with ladles, and poured into the aperture of the mould; and that for gold, the pot or crucible is taken off the fire with a kind of tongs, and thence poured into the mould.

Thus far the process is the same, in *coining* either with the mill or the hammer: when the bars are taken out of the moulds, the difference commences; so that here the article of *Coining* divides into two branches.

COINING by the Mill, or milled Money.—The bars or plates being taken out of the moulds, and scraped, and brushed, are passed several times through a mill, to flatten them further, and bring them to the just thickness of the species to be coined; with this difference, however, that the plates of gold are heated again in a furnace, and quenched in water, before they undergo the mill; which softens, and renders them more ductile: whereas those of silver pass the mill just as they are, without any heating; and when afterwards they are heated, they are left to cool again of themselves, without water.

The plates, whether gold, silver, or copper, thus reduced as near as possible to their thickness, are cut into round pieces, called *blanks* or *planchets*, near the size of the intended species, with a cutting instrument fastened to the lower extremity of an arbor, whose upper end is formed into a screw; which being turned by an iron handle, turns the arbor, and lets the steel, well sharpened, in form of a punch-cutter, fall on the plates; and thus is a piece punched out.—See the cutting instrument represented in Tab. *Miscellany*, fig. 3.

These pieces are now given to be adjusted, and brought by filing, or rasping, to the weight of the standard whereby they are to be regulated; and what remains of the plate between the circles is melted again, under the denomination of *Sisel*. The pieces are adjusted in a fine balance; and those which prove too light, are separated from those too heavy; the first to be melted

melted again, and the second to be filed down. For it may be observed, that the mill through which the plates are passed, can never be so just, but there will be some inequality, whence will arise a difference in the blanks. And this inequality, indeed, may be owing to the quality of the matter, as well as of the machine; some parts being more porous than others. When the blanks are adjusted, they are carried to the blanching, or whitening house, *i. e.* the place where the gold blanks have their colour given them, and the silver ones are whitened; which is done by heating them in the furnace, and when taken out and cooled, boiling them successively in two copper vessels, with water, common salt, and tartar; and after that scouring them well with sand, and washing them with common water, drying them over a wood fire, in a copper sieve, wherein they are put when taken out of the boilers.

The whitening, or blanching, was formerly performed very differently from what it now is: and as the ancient method is still in use among goldsmiths, and other workmen who use gold and silver, we have made a distinct article of it. See **BLANCHING**. Formerly, the planchets, as soon as blanching, were carried to the press, to be struck and receive their impressions; but now they are first marked with letters or graining, on the edges, to prevent the clipping and paring of the species; which is one of the ways wherein the ancient money used to be damaged. The machine used to mark the edges, is very simple, yet ingenious; it consists of two plates of steel, in form of rulers, about the thickness of a line, on which the legend or edging is engraven, half on the one, and half on the other. One of these plates is immovable, and strongly bound with screws to a copper plate; and that again to a strong board, or table: the other is moveable, and slides on the copper plate, by means of a handle, and a wheel, or pinion of iron, the teeth whereof catch in a kind of other teeth, on the surface of the sliding plate. Now, the planchet being placed horizontally between these two plates, is carried along by the motion of the moveable one; so, as by that time it has made half a turn, it is found marked all round. This machine is so easy, that a single man is able to mark twenty thousand planchets in a day: Savary pretends it was invented by the sieur Castagnin, engineer to the French king, and first used in 1685. But it is certain, we had the art of lettering the edges in England long before that time; witness the crowns and half-crowns of Oliver Cromwell struck in 1658, which for beauty and perfection far exceed any French *Coins* we have ever seen. Lastly, the planchets being thus edged, are to be stamped, *i. e.* their impression is to be given them in a sort of mill, or press, by the French called a *Balancier*, invented towards the latter end of the sixteenth century: See its figure in Tab. *Miscellaneous*, fig. 4.

Its chief parts are a beam, screw, arbor, &c. all contained in the body of the machine, except the first, which is a long iron bar, with a heavy ball of lead at each end, and rings, to which are fastened cords which give it motion: this is placed horizontally over the body of the machine. In the middle of the beam is fastened a screw, which by turning the beam, serves to press the arbor underneath it; to the lower extremity of which arbor, placed perpendicularly, is fastened the dye or matrice, of the reverse, or arm side, in a kind of box, or case, wherein it is retained by screws: and under this is a box, or case containing the dye of the image-side, firmly fastened to the lower part of the engine. See **MATRICE**.

Now when a planchet is to be stamped, it is laid on the image-matrice, upon which two men draw, each on his side, one of the ropes of the beam, and turn the screw fastened in it; which by this motion lowers the arbor, to which the dye of the arms is fastened; by which means, the metal being in the middle, at once receives an impression on each side, from either dye. As to the press, formerly used, it has all the essential parts of a balancier, except the beam, which is here, as it were, divided, and only drawn one way.

The blanks having now all their marks and impressions, both on the edges and faces, become money; but they have not currency till they have been weighed and examined.

For the **COINING of Medals**, the process is the same, in effect, with that of money: the principal difference consists in this, that money having but a small relief, receives its impression at a single stroke of the engine; whereas, for medals, the height of their relief makes it necessary that the stroke be repeated several times: to this end, the piece is taken out from between the dyes, heated, and returned again; which process, in medallions, and large medals, is sometimes repeated fifteen or twenty times, before the full impression be given; care being taken every time the planchet is removed, to take off the superfluous metal stretched beyond the circumference, with a file.

Add to this, that medallions, and medals of high relief, by reason of the difficulty of stamping them in the balancier, or press, are usually first cast or moulded in sand, like other works of that kind, and are only put in the press to perfect them; by reason the sand does not leave them clean, smooth, and accurate enough. Medals, therefore, receive their form and impression by degrees; money all at once.

The rule whereby they judge the medal to be sufficiently stamped, is, when feeling it with the hand, it is found firm, and

not to be shaken, as filling the dye equally every where.

COINING with the hammer, or hammered money.—In this method of making money, the bars or plates of gold, silver, or copper being taken out of the moulds, or frames, as above, are heated and stretched by beating them on the anvil: when sufficiently beaten, they are cut into pieces; which being again heated, flattened, and further stretched with the hammer, are adjusted by cutting off the angles with sheers: thus, by cutting and rounding them, they are reduced to the weight of the standard; and their roundness finished with another hammer, which beats down all the points and angles still remaining on the edges. In this manner they are brought to the size of the species to be coined.

In this state the pieces become blanks or planchets, and are carried to the blanching-house; where they undergo the same preparation as the milled money already described, and are given to the minter to stamp them with the hammer.

For this last operation, which finishes the money, they use two punches, or matrices; the one called the *pile*, and the other the *truss*, or *quiver*; each engraven dent-wife. The pile bearing the arms, and the truss the image, or cross; both their legend, date, &c.

The pile, which is about eight inches high, has a kind of tailon, or heel in the middle, and ends in a point: which figure it had, for the sake of being more easily sunk, and more firmly fastened to the block whereon the money is struck.

The minter, then, laying the planchet horizontally on the pile, and covering it with the truss, which he holds steadily in his left hand, gives several smart blows on the truss with an iron mallet held in the right; more or less, as the graving of the dyes is more or less deep. If after these first strokes, the planchet be not sufficiently stamped, it is returned again between the matrices, exactly in its former position, and the strokes are repeated till the impression be perfect.

Thus is the *Coinage* finished, and the planchets converted into money; which, after they have been examined as to their weight, become current.

English COINAGE.—Since the invention of milling money (the author whereof is not agreed on, nor even the country, where it took its rise, though the French lay claim to both) it has been imitated by several other nations; but by none with success equal to that of the English, who carried it to the utmost perfection; both by the beauty of their graving, and by their inventing the impressions on the edges, that admirable expedient for preventing the alteration of the species, above-mentioned.

Till the time of K. Charles II. the English money was generally struck with the hammer, as that of other nations; and, in effect, it is but very late, *viz.* in the reign of king William III. that the hammered species ceased to be current. Ere they were put down, the English money was in a woful condition; having been filed and clipped by natives as well as foreigners, especially the Dutch, so as to be scarce left of half the value: the retrieving this distressed state of the English money, is looked on as one of the glories of king William's reign; for which we are owing, in good measure, to the happy conduct of the late earl of Halifax.

The *Coinage* of England is now performed wholly in the Tower of London; where there is a corporation for it under the title of the *mint*.

Formerly there were here, as they are still in other countries, what we call the *rights of seignorage and brassage*; but since the eighteenth year of king Charles II. there is nothing taken, either for the king, or for the expences of *Coining*; it having been settled by act of parliament, that all money should be struck at the publick expence; so that weight is returned for weight, to all persons who carry their gold and silver to the Tower.

The species coined in England are esteemed contraband goods, and not to be exported: all foreign species are allowed by act of parliament, made in 1673, to be sent out of the realm; as well as gold and silver in bars, ingots, dust, &c. Indeed, in the session of parliament in 1718, endeavours were made to put a stop to this license, which drains England of its richest metals; but in vain; the parliament having laid aside the bill, without coming to any resolution.

The Spanish *COINAGE* is esteemed one of the least perfect in Europe: it is settled at Sevil and Segovia, the only cities where gold and silver are struck. It is true, there are brought from Mexico, Peru, and other provinces of the Spanish America, such vast quantities of pieces of eight, and other species, both of gold and silver, that, in this respect, it must be owned, there is no state in the world where so much money is coined, as in that of the king of Spain.

Muscovite COINAGE.—The Czar strikes no money but silver, and that only in the cities of Moscow, Novogrod, Twere, and Plefcou; to which may be now added Petersburg, the favourite city of her Czarian majesty. The *Coinage* of each of these cities is let out to farm, and makes part of the royal revenue.

Persian COINAGE.—All the money made in Persia is struck with the hammer; and the same may be understood of the rest of Asia and America, and the coasts of Africa, and even Muscovy.

vy; the invention of the mill not being yet gone out of Europe, nor even established in every part of it. The king's duty, in Persia, is seven and a half per cent. for all the monies coined; which are now reduced to silver and copper: there being no gold coined there, except a kind of medals at the accession of a new fohi.

The COINAGE of *Pex and Tunis*, is not under any discipline; each goldsmith, jew, and even every private person, undertaking it at pleasure: which renders their money exceedingly bad, and their commerce very unsafe.

COITION, the intercourse between male and female in the act of generation.

It is observed that frogs are forty days in the act of *Coition*. Bartholine, &c. relate, that butterflies make 130 vibrations of the wings in one act of *Coition*.

COITION is also sometimes used for that mutual attraction, or tendency toward each other, which is found between iron and the magnet.

COLARESIANS, or COLORASIANS, a sect of hereticks in the second century; so called from their leader Colarbasus, a disciple of Valentinus; who, with Marcus, another disciple of the same master, maintained the whole plenitude, and perfection of truth and religion, to be contained in the Greek alphabet; and that it was upon this account that Jesus Christ was called the *alpha and omega*.

COLARIN, in architecture, the little frise of the capital of the Doric column; placed between the atragal, and the annulets: called by Vitruvius, *Hypotrachelium*; by the French also *Gargerie*. See *FRIZE*, *HYPATRACHELION*, &c.

COLARIN is also used for the orlo, or ring, a-top of the shaft of the column, next the capital; called also the *cincture*.

COLATURE. See the article *FILTRATION*.

COLCHESTER- PLOUGH. See the article *PLOUGH*.

COLCOTHAR, in natural history, &c.—There are two kinds of *Colcothar*, natural, and *falsitious*.

Natural COLCOTHAR, otherwise called *chalchitis*, is a red vitrol, brought from Germany; formed from the common green vitrol, calcined naturally by some subterraneous fire.

Artificial COLCOTHAR is a green vitriol, calcined a long time by an intense fire; and by that means reduced to the redness of blood.

Common sulphur being mixed with iron filings, and exposed to the air, the two unite, and form a *Colcothar* perfectly like that procured by calcination from vitriol. *Vid. Hist. Acad. R. Scienc. an. 1730. p. 71.*

COLCOTHAR *Vitrioli*, is also used for the caput mortuum, or remains left at the bottom of the vessel, after the distillation of vitriol.

COLD, something devoid of heat, or which contains in it no particles of fire.

This definition is agreeable to the sentiments of most of the modern philosophers, who make *Cold* a mere negative term; and suppose the thing to consist in a privation, or diminution of heat. Others define *Cold*, much on the same principle, to be that state of the minute parts of a body, wherein they are more slowly and faintly agitated than those of the organs of feeling.—In which sense, *Cold* is a mere term of relation; and hence the same body becomes liable to be perceived hot or cold, as its particles are in a greater or less degree of motion than those of the sensible organs.

Heat is supposed to consist in a particular motion of the parts of the hot body; and hence the nature of *Cold*, which is its opposite, is easily deducible: for *Cold*, we find extinguishes, or rather abates heat; whence it seems to follow, that those bodies are *cold*, which check and restrain the motion of the particles wherein heat consists.

Now, there are three kinds of bodies which may do this, *viz.* either those whose particles are perfectly at rest; or those whose particles are indeed agitated, but that less violently than those of the hot body to which they are applied: or, lastly, those whose particles have a motion proper for exciting the sensation of heat, but which move with a different determination; so as to retain and change the motion of the particles of the organ.

Hence, there arise three different kinds of *Cold*, or cold bodies: the first is, that *Cold* common to all hard bodies, which consists in the rest of their parts. The second is that which arises on plunging any part of our body in water; which consists in this, that the parts of our præcordia being more briskly agitated than those of the fluid, communicate part of their motion to it. The third, the *Cold* felt on collecting even warm air with a fan, or in blowing hot breath out of our mouth, with the lips close shut; which consists in this, that the direct motion of the particles of air, do, in some measure, change and rebate the motion and determination of the parts of the body: and hence it is, that a *cold* body cannot cool another without heating itself. Hence also it is, that the more parts of a frigid body are at rest, the more must the particles of a warm body applied to heat them, lose of their motion, and by consequence of their heat. Thus a marble having more quiescent parts than wood, which is full of pores and interstices, is felt colder than wood. Hence also we see why air, near marble and other dense bodies, feels somewhat colder than in other places.

On this principle, the two latter kinds of *Cold* appear somewhat more than privations: the particles inducing the *Cold*, may be esteemed real frigorific corpuscles; and the coldness be deemed a real quality as well as hotness.

These particles do not only check the agitation of those continually diffused from the inner parts of the animal to the outer; but, having an elastic power, they bend and hang about the filaments of the body, pinch and squeeze them; and hence that acute pungent sensation called *Cold*.

That *Cold* is more than a mere relation, or comparison, is evident from its having real and positive effects; such as freezing, congelation, condensation, rarefaction, bursting, &c. See *FREEZING*, &c.

Dr. Clarke takes *Cold* to be owing to certain nitrous, and other saline particles, endowed with particular figures proper to produce such effects. Hence, sal ammoniac, salt petre, or salt of urine, and many other volatile and alkalize salts, mixed with water, increase its degree of *Cold* very sensibly. Hence also that popular observation, that *Cold* prevents corruption; which, however, must not be admitted without an exception: since, if a hard, porous body have its interstices filled with water, and this be too much dilated by freezing, the including body will be burst. And thus it is, that *Cold* proves destructive to the parts of some plants.

Potential COLD. See the article *POTENTIAL*.

COLD Baths. See the article *BATHS*.

COLD *Diamargariton*. See the article *DIAMARGARITON*.

COLD *Diatragacanth*. See the article *DIATRAGACANTH*.

COLD *Distillations*. See the article *DISTILLATION*.

COLIC, in medicine, a severe gnawing pain, felt in the lower venter; so called, because the ordinary seat of the disorder was antiently supposed to be in the intestine colon.

Physicians usually distinguish three kinds of *Colic*, the *bilious*, *windy*, and *nephritic*.—The *bilious Colic* has its rise from certain sharp, bilious, stimulating humours, which being diffused through the intestines, vellate their fibres, and occasion a sensation of pain. Though Willis takes the part here principally affected to be the mesentery.

Dr. Sydenham observes, that the *bilious Colic* usually attacks people about the beginning of summer; that it is generally attended with a vomiting of bilious green liquor; that the patient complains of excessive heat, great gripings, faintness, &c. and that if it be not soon remedied, it is apt to turn into the iliac passion.

Baglivi notes, that if the patient sweat much, and be much enfeebled; the disease is apt to degenerate into a palsy. The cure, he says, depends on bleeding, gentle cathartics, and clysters; and if it arise from a cramp, an emetic is to proceed: after which, the cure is to be completed with proper anodynes.

Wind COLIC, is a vague pain, never staying in any fixed place; being produced by windy vapours, which swell and distend the intestines they are inclosed in.

Nephritic COLIC is that felt particularly in the reins, whence it has its name.

It usually has its rise from some stone, or gravel detached from the kidneys, and fallen into the pelvis. The *parcira brava* is said to be a specific for *nephritic Cafes*.

S. Manouchi, a Venetian physician at the court of the great Mogul, gives the following remedy as infallible in *nephritic cafes*: an iron ring, about an inch and half in diameter, and thick in proportion, is to be heated red-hot; then, laying the patient on his back, the red-hot ring is to be applied to his navel, so as that the navel be in the center of the ring: the patient will presently feel the pain, which will occasion him to shrink back very suddenly; and the sudden revulsion thus occasioned in the lower venter, will, in a little time, dissipate all his pains. The same author adds, that he can warrant the success of this odd remedy.

In *Colics* arising from flatulencies, carminative waters, oils, aromatics, &c. are always to be added to the compositions: and in *nephritic Colics*, besides emollient clysters, solutions of manna, cremor tartari, &c. in whey, &c. and proper oleaginous mixtures are to be exhibited to relax the fibres; after which, proper anodynes take place.

Some, particularly Sydenham, mention a *nervous Colic*, mostly incident to histeric and hypocondriac persons; but this appears only a species of the *windy Colic*.

Baglivi recommends camomile as an antidote against the *Colic*, from what cause soever it arise. Where the disease is obdurate, much riding has been found of especial service. See *Supplement*, article *COLIC*.

COLIR, an officer in China, who has an eye over what passes in every court, or tribunal in the empire; and though himself not of the number, yet is assisting at all assemblies, the proceedings whereof are communicated to him.

He is properly what we may call an *inspector*: he gives secret intelligences to the court; and even, on occasion, accuses the mandarins of their faults openly; and that not only of faults in their public offices, but even in private life. To keep him impartial, he is kept independent; by having the post for life. These *Colirs* make even the princes of the blood tremble.

COLISEUM*, or **COLISEUM**, in the ancient architecture, an oval amphitheater, built at Rome by Vespasian, in the place where stood the palace of Nero's gilded house.

* The word is formed from *Coliseum*, on account of the colossus of Nero, that stood near it; or, according to Nardini, from the Italian *colisse*.

In this were placed statues, representing all the provinces of the empire; in the middle whereof stood that of Rome, holding a golden apple in her hand.—The same term, *Coliseum*, is also given to another amphitheater of the emperor Severus.

In these *Colisea* were represented games, and combats of men and wild beasts; but there is now little remaining of either of them; time and war having reduced them to ruins.

COLLAR, an ornament, wore by the knights of several military orders, hanging over their shoulder, on the mantle; and its figure drawn around their armories.

The *Collar* ordinarily consists of a chain of gold, enamelled; frequently set with cyphers, or other devices, and having the badge of the order suspended at bottom.

The *Collar* of the order of the garter, consists of SS, with roses enamelled red, within a garter enamelled blue, the George at the bottom.

Maximilian is said to have been the first of the emperors who put the *Collar* of an order around his arms, upon his being made chief of that of the golden fleece.

Knights of the COLLAR, a military order in the republic of Venice; called also the *order of St. Mark*, or the *medal*.

It is the doge and the senate that confer this order: the knights bear no particular habit, only the *Collar*, or chain, which the doge puts around the neck; with a medal, whereon is represented the winged lion of the republic.

COLLATERAL*, in geography, any thing, place, country, &c. situate by the side of another.

* The word is a compound of *con*, with, and *latus*, side.

COLLATERAL Points, in cosmography, the intermediate points; or those between the cardinal points. The *Collateral Points* are either *primary*, which are those removed by an equal angle on each side from two cardinal points: or *secondary*; which, again, are either those of the first, or second order.—The first are those equally distant from a cardinal and first primary; the latter equally distant from some cardinal or primary, and first secondary.

COLLATERAL Winds, are those blowing from *Collateral* points.

See **WIND**.

Such are the north-east, south-east, north-west, south-west, &c. with their subdivisions.

COLLATERAL, in matters of genealogy, is understood of those relations which proceed from the same stock, but not in the same line of ascendants, or descendants; but being, as it were, aside of each other.

Thus, uncles, aunts, nephews, nieces, and cousins, are *Collaterals*, or in the *Collateral* line. Those in a higher degree, and nearer the common root, represent a kind of paternity with regard to those more remote; but there is a kind of equality between *Collaterals* in the same degree.

Collateral descent stands in opposition to *direct descent* to posterity; the former passing to brothers children, but the latter only from father to son.

COLLATERAL Assurance, in law, is a bond, made over, and beyond the deed itself, for the performance of covenants between man and man; thus called, as being external, and without the nature and essence of the covenant.

Crompton says, that to be subject to the feeding of the king's deer, is *Collateral* to the soil within the forest. It may be added, that liberty to pitch booths in a fair, or another man's ground, is *collateral* to the ground.

COLLATERAL Condition. See the article **CONDITION**.

COLLATERALS Penis, in anatomy, a muscle, otherwise called *erigens*, or *erector penis*. See **ERECTOR**.

COLLATION, in the canon law, the conferring, or bestowing of a benefice by a bishop, who has it in his own gift, or patronage.

Collation differs from *institution*, in that the latter is performed by the bishop, at the motion or presentation of another: And the former on his own motion.

Collation also differs from *presentation*, in that the latter is properly the act of a patron, offering his clerk to the bishop, to be instituted into a benefice; whereas the former is the act of the bishop himself. The *Collator* can never confer a benefice on himself.

In the Romish church, the pope is the collator of all benefices, even elective ones, by prevention; setting aside consistorial benefices, and those in the nomination of lay-patrons. Prelates and bishops are called *ordinaries*, or ordinary collators.

If the ordinary collator neglect to exercise his right for six months, the superior collator may collate by devolution. Thus, if the bishop neglect, the metropolitan may confer; then the primate; and so on from degree to degree.

In France, the king is the collator of all the benefices whereof he is patron, excepting consistorial ones, to which he has only the nomination, and the pope by virtue of the concordat, is

obliged to confer on whomsoever the king nominates. For the rest, he is direct and absolute collator; and may confer them, by virtue of a kind of priesthood annexed to the royalty.

Other lay-patrons have seldom more than a mere presentation; the *Collation* properly belonging to the bishop: yet there are some abbots who have the full right of *Collation*.

The canonists reckon two kinds of *Collation*; the one free, and voluntary, the other necessary. The first depending on the mere will of the collator, who may chuse whom he pleases to fill the vacancy. In the latter, the collator is not at his liberty: which is the case where a benefice has been resigned, or changed, and that resignation or permutation allowed of by the superior; for here the collator is obliged to grant the provision to the resignatory, or commutatory.

It is a maxim in the new canon law, *collationes sunt in fructibus*; 'Those who have the fruits of a benefice, have the *Collation*.' But in that case, the word *Collation* is used for presentation.

COLLATION, in common law, is the comparison, or presentation of a copy to its original, to see whether or no it be conformable: or the report, or act of the officer who made the comparison.

A collated act is equivalent to an original; provided all the parties concerned were present at the *Collation*.

COLLATION is also used among the Romanists for the meal or repast made on a fast-day, in lieu of a supper.

Only fruits are allowed in a *Collation*: F. Lobineau observes, that antiently there was not allowed, even, bread in the *Collations* in lent; nor any thing beside a few comfits and dried herbs, and fruits: which custom, heads, obtained till the year 1513.

Cardinal Humbert observes further, that in the middle of the eleventh century, there were no *Collations* at all allowed in the Latin church in the time of lent; and that the custom of *Collations* was borrowed from the Greeks; who themselves did not take it up till about the eleventh century.

COLLATION is also popularly used for a repast between dinner and supper.

The word *Collation*, in this sense, Du Cange derives from *collocutio*, conference; and maintains, that originally, *Collation* was only a conference, or conversation on subjects of piety, held on fast-days in monasteries; but that, by degrees, the custom was introduced of bringing in a few refreshments: and that by the excesses to which those sober repasts were at length carried, the name of the abuse was retained, but that of the thing lost.

COLLATIONIS forma. See the article **CONTRA**.

COLLEAGUE, a companion, partner, or associate in the same office, or magistrature. See **ADJUNCT**, and **ASSOCIATE**.

The word is particularly used in speaking of the Roman consuls, and emperors.

COLLECT, **COLLECTION**, a voluntary gathering of money, for some pious, or charitable purpose.

Some say, the name *Collecta*, or *Collection*, was used, by reason those gatherings were antiently made on the days of *Collects*, and in *Collects*, i. e. in assemblies of christians; but, it was more probably, *quia colligebatur pecunia*.

COLLECT is sometimes also used for a tax, or imposition, raised by a prince for any pious design.—Thus, histories say, that in 1166, the king of England, coming into Normandy, appointed a *Collect* for the relief of the holy land, at the desire, and after the example of the king of France.

COLLECT, in the liturgy of the church of England, and the mass of the Romanists, denotes a prayer accommodated to any particular day, occasion, or the like.

In the general, all the prayers in each office are called *Collects*; either because the priest speaks in the name of the whole assembly, whose sentiments and desires he sums up by the word *oramus*, let us pray, as is observed by pope Innocent III. or, because those prayers are offered when the people are assembled together; which is the opinion of Pamelius on Tertullian.

The congregation itself is in some antient authors called *Collecta*. The popes Gelasius and Gregory are said to have been the first who established *Collects*. Delpense, a doctor of the faculty of Paris, has an express treatise on *Collects*, their origin, antiquity, authors, &c.

COLLECTIVE, in grammar, a term applied to a word that expresses a multitude; though itself be singular.

Thus, troop, company, and army, are nouns *Collective*.

COLLECTOR, a person nominated by the commissioners of any duty, the inhabitants of a parish, or the like, to raise or gather any tax, &c.

COLLEGATARY, in the civil law, a person to whom is left a legacy in common with one or more other persons.

If the thing be bequeathed *in solido*, the portion of a deceased *Collegatary* accrues to the rest.

COLLEGE, an assemblage of several bodies, or societies; or, even of several persons into one society.

College, *collegium*, among the Romans, was used for an assemblage of several persons employed in the same functions, and as it were bound together to act, or serve in concert. It served indifferently for those employed in the offices of religion, of government, the liberal arts, and even mechanical arts, or trades; so that

the word properly signified what we call a *corporation*, or *company*.

In the Roman empire, there were not only the *College of augurs*, and the *College of capitoline*, i. e. of those who had the superintendence of the capitoline games; but also *Colleges of artificers*, *collegia artificum*; *College of carpenters*, *fabricum*, or *fabrorum*; *College of potters*, *figularum*; of founders, *avarium*; the *College of locksmiths*, *fabrorum ferrariorum*; of engineers, for the army, *signariorum*; of butchers, *laniorum*; of dendrophori, *dendrophorum*; of centonaries, *centonariorum*; of makers of military cafaques, *sagariarum*; of tent-makers, *tabernaculariorum*; of bakers, *pistorum*; of musicians, *tibicinum*, &c.

Plutarch observes, that it was Numa who first divided the people into *Colleges*; which he did, to the end that each consulting the interests of their *College*, whereby they were divided from the citizens of the other *Colleges*, they might not enter into any general conspiracy against the publick repose.

Colleges were distinguished from other societies not formed into *Colleges* by publick authority, in this, that those who composed a *College* were qualified to treat of the common interests of their *College*, which was, as it were, a member of the state, and had a common purse, an agent to negotiate their affairs, sent deputies to the magistrates when they wanted to treat with them; might make statutes and by-laws for the administration of their *College*.

There are various *Colleges* on foot among the moderns, built on the model of those of the antients; as the *three Colleges of the empire*, viz. the *College of electors*, *College of princes*, and *College of cities*, &c.

COLLEGE of Electors, is the body of electors, or their deputies, assembled in the diet at Ratisbon. See **ELECTOR**.

Antiently, the king of Bohemia had no deputy in this *College*; at present he has.

COLLEGE of Princes, is the body of princes, or their deputies, at the diet of Ratisbon.

COLLEGE of Cities, is, in like manner, the body of deputies which the several imperial cities send to the diet.

COLLEGE of Cardinals, or the *sacred COLLEGE*, is a body composed of the three orders of cardinals, viz. cardinal-bishops, cardinal-priests, and cardinal-deacons.

Each order has its dean, or chief. The dean of the cardinal-bishops is always the bishop of Ostia. See **CARDINAL**.

COLLEGE is also used for a publick place, endowed with certain revenues, where the several parts of learning, both divine and human, are taught, in schools, halls, or classes, appointed for that purpose.

An assemblage of several of these *Colleges* constitute a university.

The university of Oxford consists of nineteen *Colleges*, and six halls; that of Cambridge of twelve *Colleges*, and four halls; and that of Paris of fifty four *Colleges*, such as they are. In reality, there are but ten where there is *full exercise*, as it is called; for the rest, the author of a late description of Paris says it is needless to recite their names, since there is no teaching in them.

The erection of *Colleges* is part of the royal prerogative, and is not to be done without the king's consent.

Among the Greeks, the lyceum and academy were celebrated *Colleges*; the latter of which has given its name to our universities, which in Latin are called *academice*. With them, the house, or apartment of each philosopher, or rhetor, might be esteemed a kind of *College* of itself.

The Romans came late into the institution of such *Colleges*: they had, however, several, founded by their emperors; especially in Gaul; the chief whereof were those of Marcellus, Lions, Befançon, and Bourdeaux.

The Jews, and Egyptians too, have had their *Colleges*; the chief of the first were those of Jerusalem, Tiberias, Nardca, Pampodita, Sura, and Babylon: this last is said to have been instituted by Ezekiel, and to have subsisted in the time of Mahomet.

Colleges of this kind have been generally in the hands of those consecrated to the offices of religion: the Magi in Persia, the Gymnosophists in the Indies, and the Druids in Gaul and Britain, had the care of educating youth in the sciences.

After christianity became established, there were almost as many *Colleges* as monasteries; Charlemain, in his capitulars, enjoining the monks to instruct youth in music, grammar, and arithmetic: but, this, calling the monks from their solitude, and taking up too much of their time, the care of the *Colleges* was at length put into the hands of those who had nothing else to do.

In the canon law, it is said, three persons make a *College*, *tres collegium faciunt*.—The *Colleges* in London, are,

STON-COLLEGE, or the *College of the London clergy*; which has been a religious house time out of mind, sometimes under the denomination of a priory, sometimes under that of a spittal, or hospital: at its dissolution under 31 Hen. VIII. it was called *Ellyn's Spittle*, from the name of its founder, a mercer, in 1329.

At present, it is a composition of both, viz. a *College* for the clergy of London, who were incorporated in 1631, at the request of Dr. White, under the name of the *President and Fellows of STON-COLLEGE*; and an hospital for ten poor men, and as many women.

The officers of the corporation are the president, two deans, and four assistants; who are annually chosen from among the rectors and vicars of London; and are subject to the visitation of the bishop. They have a good library, built and stocked by Mr. Simson, chiefly for the clergy of the city, without excluding other students on certain terms; and a hall, with chambers for students, generally filled with the ministers of the neighbouring parishes.

COLLEGE of Civilians, commonly called *Doctors-Commons*; a *College* founded by Dr. Harvey, dean of the arches, for the professors of the civil law residing in this city; where usually, likewise, reside the judge of the arches court of Canterbury, judge of the admiralty, of the prerogative court, &c. with other *Civilians*; who all live, as to diet and lodging, in a collegiate manner, commoning together: whence the appellation of *Doctors Commons*. Their house being consumed in the great fire, they all resided at Exeter-house in the Strand, till 1672; when their former house was rebuilt, at their own expence, in a very splendid manner. To this *College* belong 34 proctors; who make themselves parties for their clients, manage their causes, &c.

COLLEGE of Physicians, a corporation of physicians, in London; who, by several charters, and acts of parliament of Henry VIII. and his successors, have certain privileges, whereby no man, though a graduate in physick of any university, may, without license under the said *College*, practise physick, in, or within seven miles of London; with power to administer oaths, fine and imprison offenders, in that and several other particulars: to search the apothecaries shops, &c. in and about London, to see if their drugs, &c. be wholesome, and their compositions according to the form prescribed by the said *College* in their dispensatory.

By the said charter they are also freed from all troublesome offices; as to serve on juries, be constable, keep watch, provide arms, &c.

This society had antiently a *College* in Knightrider-street, the gift of Dr. Linacre, physician to king Henry VIII. Since that, they have had a house built them by the famous Dr. Harvey, in 1652, at the end of Amen-street, which he endowed with his whole inheritance in his life-time; but this being burnt in the great fire in 1666, a new one was erected at the expence of the fellows, in Warwick-Lane; with a noble library, given partly by the marquis of Dorchester, and partly by Sir Theodore Mayerne.

Of this *College* there are a president, four censors, and twelve electors: the censors have, by charter, power to survey, govern, and arrest all physicians, or others practising physick, in, or within seven miles of London; and to fine, amerce, and imprison them at discretion.

The number of fellows was antiently thirty, till king Charles II. increased their number to forty; and king James II. giving them a new charter, allowed the number of fellows to be enlarged, so as not to exceed fourscore; reserving to himself and successors, the power of placing and displacing any of them for the future.

The *College* are not very rigorous in asserting their privileges; there being a great number of physicians, some of very good abilities, who practise in London, &c. without their license, and are connived at by the *College*: yet, by law, if any person, not expressly allowed to practise, take on him the cure of any disease, and the patient die under his hand, it is deemed felony in the practitioner.

In 1696, the *College* made a subscription, to the number of forty two of their members, to set on foot a dispensary for the relief of the sick poor: since that, they have erected two other dispensaries.

GRESHAM-COLLEGE, or **COLLEGE of Philosophy**; a *College* founded by Sir Thomas Gresham, and endowed with the revenue of the Royal-Exchange: one moiety of this endowment the founder bequeathed to the mayor, and aldermen of London, and their successors, in trust, that they should find four able persons to read within the *College*, divinity, geometry, astronomy, and music; and to allow each, besides lodging, fifty pounds per ann. The other moiety he left to the company of mercers, to find three more able persons, to read civil law, physick, and rhetoric, on the same terms; with this limitation, that the several lecturers should read in term-time, every day in the week, except Sundays; in the morning in Latin, in the afternoon the same in English: but that in music to be only read in English. In this *College* formerly met the royal society, that noble academy, instituted by king Charles II. and celebrated throughout the world, for their improvements in natural knowledge. See their history and policy, under **SOCIETY**.

COLLEGE of Heraldry, or **COLLEGE of Arms**, a corporation founded by charter of king Richard III. who granted them several privileges; as, to be free from subsidies, tolls, offices, &c. See **HERALD**.

They had a second charter from king Edward VI. and a house built near *Doctors-Commons*, by the earl of Derby, in the reign of king Henry VII. was given them by the duke of Norfolk, in the reign of queen Mary; which house is now rebuilt.

Of this collegiate society, are three officers styled *kings of arms*,

regis armum anglorum. See **KING** at *armi*. Six Heralds. See **HERALD**. And four Pursuivants. See **PURSUIVANT**.

COLLEGES of *Common Law*. See **INNS** of *Court*, and *Chancery*.

COLLEGES for disabled *Soldiers*, *Seamen*, &c. See **HOSPITALS**.

COLLEGIAL. See the article **COLLEGIATE**.

COLLEGIANS, **COLLEGIANT**, a religious sect, formed among the Arminians and Anabaptists in Holland; so called, because of their *Colleges*, or meetings the first Sunday in each month; where every one has the same liberty of expounding the scripture, praying, &c.

They are said to be all either Arians, or Socinians: they never communicate in the *College*, but meet twice a-year from all parts of Holland at Rinsborough, a village two miles from Leyden, where they communicate together; admitting every one that presents himself, without regard to his sect or opinion. They have no particular ministers, but each officiates as he is disposed. They never baptize without dipping.

COLLEGIATE, or **COLLEGIAL Churches**, are those which have no bishop's see, yet have the ancient retinue of the bishop, the canons, and prebends.

Such are, among us, Westminster, Rippon, Windsor, &c. governed by deans and chapters. See **DEAN** and **CHAPTER**.

Of these *Collegiate churches*, there are two kinds; some of royal foundation, others of ecclesiastical foundation: each of them, in matters of divine service, are regulated in the same manner as the cathedrals.

There are even some *Collegiate churches* which have the episcopal rights. Some of these churches were antiently abbeys; which, in time, were secularized.

The church of St. Peter's, Westminster, was antiently a cathedral; but the revenues of the monastery being by act of parliament to Eliz. vested in the dean and chapter, it commenced a *Collegiate church*.—In several causes, the titling it *Cathedral*, instead of *Collegiate Church* of Westminster, has occasioned error in the pleadings.

COLLEGIATE Auditors. See the article *auditor*.

Verger of **COLLEGIATE Churches**. See **VERGER**.

COLLETICS*, **COLLETICA**, in medicine, such remedies as join, and glue together the separated parts, or lips of a wound, or ulcer; and thus re-establish them in their natural union. See **AGGLUTINANT**.

* The word comes from the Greek *καλλωτιν* *Colletica*, something that has the virtue of gluing together: of *καλλω*, *gluten*.

Colletics are more efficacious than farotics; but less so than epulotics. See **SARCOTICS**, and **EPULOTICS**.—Among *Colletics* are ranked litharge, aloes, myrrh, &c.

COLLINS'S Quadrant. See the article **QUADRANT**.

COLLIQUATION, in pharmacy, the action of melting together two, or more solid substances; or rendering them liquid by fusion, or dissolution; as wax, mucilages, &c. by heat; gums, &c. by moisture.

COLLIQUATION is also used to express such a temperament, and disposition of the animal fluids, as proceeds from a too lax compages; whereby they flow off through the several glands, and particularly through those of the skin, faster than they ought; which occasions fluxes of many kinds, but mostly, profuse, greasy, clammy sweats.

If this *Colliquation* continue, it generally terminates in an hectic fever, and is usually a concomitant of one.

The curative intention in this case, is the giving a better consistence to the juices by balsamicks and agglutinants; and the hardening of the solids by subastringents. Hence,

COLLIQUATIVE Fever, is a fever attended with a diarrhæa; or profuse sweats, from too loose a texture of the fluids.

COLLISEUM. See the article **COLISEUM**.

COLLISION, the friction, or percussion of two bodies moving violently with different directions, and dashing against each other. See **PERCUSSION**.

COLLUSION, a secret understanding between two parties, who plead, or proceed fraudulently against each other, to the prejudice of a third.

In the canon law, *Collusum*, in matters of benefices, vacates the benefice, and incapacitates the person from holding any benefice at all.

COLLUM, in anatomy. See **NECK**, and **CERVIX**.

COLLI interspinales. See the article **INTERSPINALES**.

COLLI intertransversales. See **INTERTRANSVERSALES**.

COLLI transversalis. See the article **TRANSVERSALIS**.

COLLUTHIANS, a religious sect, who rose about the beginning of the fourth century; on occasion of the indulgence shewn to Arius, by Alexander patriarch of Alexandria.

Several people being scandalized at so much condescension; and among the rest, Colluthus, a priest of the same city; he hence took a pretence for holding separate assemblies, and by degrees proceeded to the ordination of priests; as if he had been a bishop: pretending a necessity for this authority, in order to oppose Arius. To his schism he added heresy; teaching, that God did not create the wicked; that he was not author of the evils that befall men, &c. — He was condemned in a council held at Alexandria by-Ofius, in the year 335.

COLLYRIANS, antient heretics, denominated from a little

cake, called by the Greeks *Collyrida*, which they offered to the virgin Mary.

This sect, it seems, consisted chiefly of Arabian women, who, out of an extravagance of devotion to the virgin, met on a certain day in the year, to celebrate a solemn feast, and to render divine honours to Mary as to a goddess; eating the cake which they offered in her name.—St. Epiphanius, who relates the history of this superstitious ceremony, laughs at it.

COLLYRIUM*, in medicine, an external remedy, appropriated to diseases of the eyes.

* The word comes from the Greek *καλλωριον*; and that, according to Martinus, from *καλλω τον οφθ* because it glues up, and prevents defluations.

There are two kinds of *Collyriums*; the one *liquid*, the other *dry*.—*Liquid Collyriums*, *υγροκαλλωρια*, are composed of ophthalmic powders in waters; as rose-water, plantain-water, that of fenel, eyebright, &c. wherein they dissolve tutty, white vitriol, or some other proper powder.

The *dry Collyria*, *ξηροκαλλωρια*, are troches of rhais, sugar-candy, iris, tutty prepared, &c. blown into the eye with a little pipe.

COLLYRIUM is also a name given to unguents used for the same purpose; as unguent of tutty, and several others.

COLLYRIUM is also a denomination given, though improperly, to some liquid medicines used against venereal ulcers.

COLOCYNTHIS. See the article **COLOQUINTIDA**.

COLON, in grammar, a point, or character formed thus [:] serving to mark a pause, and to divide the members of a period. See **POINTING**; see also **PERIOD**, **COMMA**, and **SEMICOLON**. Grammarians generally assign the use of a *Colon* to be to mark the middle of a period; or to conclude a sense less perfect than the dot, or period—but, a sense less perfect than the period, is an expression extremely vague and indeterminate.

Others say, a *Colon* is to be used when the sense is perfect, but the sentence not concluded—but neither is this over-clear and express. Add to this, that in practice our best writers confound the *Colon* with the semicolon.

F. Butler attempts to fix the use of the *Colon*; but he does not much distinguish it from the semicolon: he prescribes the use of either, indifferently; and calls them by a common name, *intermediate pointings*; as being mediums between the comma, and fullpoint or period. Their use, according to this author, is to distinguish the supernumerary members of a period.

By supernumerary members, are meant, such as the precedent ones do not raise any expectation of; i. e. such parts, as have indeed a dependence on what goes before, even though what goes before has a complete sense, independent hereon: v. gr. *The Augustan age was so eminent for good poets, that they have served as models to all others: yet did it not yield any good tragic poets*. Where the supernumerary member, and the use of the *Colon* are obvious. The most obvious and sensible use of the *Colon*, he adds, is when the supernumerary member is distinguished by some conjunction; as, *notwithstanding, however, but, except that, unless, inasmuch as, yet, since, the rather as, provided that, &c.*

Some, indeed, use the *Colon* in the middle of long periods, without any regard to supernumerary members: which custom was probably introduced, to mark that the breath is here to be taken almost as much as in a common period, in the place where the supernumerary period commences. But this, at best, is arbitrary; and the intermediate pointings may always be omitted in a period, if there be no supernumerary member; i. e. if there be no subsequent member, but what is expected from the precedent.

As to the occasions where the *Colon* is to be used, rather than the semicolon, there is nothing precise to be said of it; except that the *Colon* shews the supernumerary member more detached, and sets it at a greater distance from the rest; and therefore marks a longer pause than the semicolon.

Accordingly, it seems preferable to the semicolon before conjunctions adverbative, restrictive, conditional, &c. as, *nevertheless, but, excepting that, however, otherwise, provided that*. Again, where the supernumerary phrases not only suppose the precedent, but depend on them for their regimen, and are, as it were, new parts thereof; there the semicolon seems preferable to the *Colon*. v. gr. *You are regardless of the goodness of God, who first chose you; a God who is only jealous of your heart for your own happiness; a God who could be equally glorious in destroying you by his justice, as in saving you by his mercy*. Or thus: *The discourse consisted of two parts; in the first was shewn the necessity of fighting; in the second, the advantages that would redound from it*.

But this difference, it must be owned, has a dependence on something that influences all the points, and sways the whole doctrine of punctuation; viz. the length, or shortness of the members and periods: for when the phrases are long, we point higher than when short.

A later author, in an ingenious discourse, *de ratione interpunctionis*, marks the office of the *Colon*, and wherein it differs from the semicolon, &c. more precisely: a *Colon*, on his principles, serves to distinguish those conjunct members of a sentence, which are capable of being divided into other members; whereof one, at least, is conjunct.

Thus, in the sentence, *as we cannot discern the shadow moving along the dial-plate, so the advances we make in knowledge are only*

perceived by the distance gone over; the two members being both simple, are only separated by a comma: in this, as we perceive the shadow to have moved, but did not perceive it moving; so our advances in understanding, in that they consist of such minute steps, are only perceivable by the distance; the sentence being divided into two equal parts, and those conjunct ones, since they include others; we separate the former by a semicolon, and the latter by commas: but in this, as we perceive the shadow to have moved along the dial, but did not perceive it moving; and it appears the grass has grown, though no body ever saw it grow: so the advances we make in knowledge, as they consist of such minute steps, are only perceivable by the distance. The advancement in knowledge is compared to the motion of a shadow, and the growth of grass; which comparison divides the sentence into two principal parts: but since what is said of the movement of the shadow, and likewise of the growth of grass, contains two simple members, they are to be separated by a semicolon; consequently, a higher pointing is required to separate them from the other part of the sentence, which they are opposed to: and this is a *Colon*.

COLON*, in anatomy, denotes the second of the thick intestines.

- Some derive the word from *καλναι*, to retard; in regard it is in the folds of this intestine that the excrements are stopped and formed. Others fetch it from *καλον*, on account of its capacity: Others again from *καλασσειν*, to be tormented; in regard of the grievous pain it frequently undergoes.—It is from this part that the colic takes its name.

The *Colon* is placed between the ilion and rectum, and is wider than either of them: in length it is eight or nine hands.—It begins where the ilion ends, *viz.* in the cavity of the os ilium, on the right side; whence, ascending by the kidney on the same side, it passes under the concave side of the liver, to which it is sometimes tied, as likewise to the gall-bladder, which tinges it yellow in that place: then it runs under the bottom of the stomach to the spleen in the left side, to which it is also knit; from thence it turns down to the left kidney; and thence passing in form of an S, it ends at the upper part of the os sacrum in the rectum.

At the beginning of this gut, there is a valve formed by the production of the inmost coat of the intestines in this place; which hinders the excrements, when once fallen into the *Colon*, from returning again to the ilium.

It has a strong ligament, which running along its upper side, from the ilium to the rectum, strengthens it against the weight of the excrements, and draws it together into cells; which, with the valvula conniventes, retard the passages of the excrements, that we may not be continually obliged to be going to stool. The fleshy fibres of its second coat are greater and stronger than those of the other intestines; because a greater strength is requisite to cause the excrements to ascend.

The chief design of the *Colon*'s surrounding the abdomen, and, with the rectum, touching all the parts contained in it, seems to be, that by immediate fomentation with clysters, they might be eased of their maladies.

MESO-COLON. See the article **MESO-COLON**.

COLONEL*, an officer in the army, who has the command in chief of a regiment, either of horse, foot, or dragoons.

- Skinner derives the word from *colony*; being of opinion, the chiefs of colonies called *coloniales*, might give the name to chiefs of forces.

In the French and Spanish armies, *Colonel* is confined to the infantry and dragoons: the commanding officer of a regiment of horse, they usually call *major de camp*.

COLONEL-LIEUTENANT, is he who commands a regiment of guards, whereof the king, prince, or other person of the first eminence is *Colonel*.

These *Colonels Lieutenants* have always a *Colonel's* commission, and are usually general officers.

LIEUTENANT-COLONEL, is the second officer in the regiment; who is at the head of the captains, and commands in the absence of the *Colonel*.

Lieutenant-Colonel of horse, or dragoons, is the first captain of the regiment. See **CAPTAIN**.

COLONADE, a peristyle of a circular figure; or a series of columns disposed in a circle, and insulated within-side. See **PERISTYLE**.

Such is that of the little park at Versailles, which consisted of 32 Ionic columns; all of solid marble, and without incrustation.

A *Polystyle COLONADE*, is that whose number of columns is too great to be taken in by the eye at a single view. Such is the *Colonnade* of the place of St. Peter at Rome; which consists of 284 columns of the Doric order, each above four foot and an half in diameter; all of Tiburtine marble.

COLONY*, **COLONIA**, a company of people, of all sexes and conditions, transported into a remote province, in order to cultivate, and inhabit it.

- Originally, the word *Colony*, signified no more than a farm; *i. e.* the habitation of a peasant, *colonus*, with the quantity of land sufficient for the support of his family: *quantum colonus unus arare poterat*.

We may distinguish three kinds of *Colonies*: those serving to ease, or discharge the inhabitants of a country; where the people are become too numerous, so that they cannot any longer conveniently subsist.

The second are those established by victorious princes and people, in the middle of vanquished nations, to keep them in awe and obedience.

The third may be called *Colonies of commerce*; because, in effect, it is trade that is the sole occasion and object thereof.

It was by means of the first kind of *Colonies*, that some ages after the deluge, the east, first, and successively all the other parts of the earth became inhabited: and without mentioning any thing of the Phenician and Grecian *Colonies*, so famous in ancient history, it is notorious that it was for the establishment of such *Colonies*, that during the declension of the empire, those torrents of barbarous nations, issuing, for the generality, out of the north, over-run the Gauls, Italy, and the other northern parts of Europe; and after several bloody battels, divided it with the antient inhabitants.

For the second kind of *Colonies*, the Romans used them more than any other people; and that to secure the conquests they had made from the west to the east. Every one knows how many cities in Gaul, Germany, Spain, and even in England, value themselves on their having been of the number of Roman *Colonies*.

Lastly, the *Colonies of commerce*, are those established by the English, French, Spaniards, Portuguese, and other nations within these two last centuries, and which they continue still to establish, in several parts of Asia, Africa, and America; either to keep up a regular commerce with the natives, or to cultivate the ground, by planting sugar-canes, indigo, tobacco, and other commodities.

The principal of this kind of *Colonies*, are in the one and the other America, northern and southern; particularly Peru, Mexico, Canada, Virginia, New-England, Carolina, la Louisiane, l'Acadia, Hudson's Bay, the Antilles Islands, Jamaica, Domingo, and the other islands.—In Africa, Madagascar, Cape of Good Hope, Cape Verd, and its islands, and all those vast coasts, extended thence as far as to the red sea.—Lastly, in Asia, the famous Batavia of the Dutch; Goa, Diu of the Portuguese; and some other less considerable places of the English, French, and Danes.

There were two kinds of *Colonies* among the Romans; those sent by the senate; and the military ones, consisting of old soldiers, broken and disabled with the fatigues of war, who were thus provided with lands, as the reward of their services.

The *Colonies* sent by the senate, were either Roman, or Latin; *i. e.* they were composed either of Roman citizens, or Latin.—The *Colonies* of Roman citizens had the right of suffrages; but had no part in the offices or honours of the republic. The inhabitants of Latin *Colonies*, had no right of suffrages without an express permission.

According to Ulpian (l. 1. *D. de Cens.*) there were other *Colonies*, which had little more than the name; only enjoying what they called *jus italicum*, *i. e.* they were free from the tributes and taxes paid by the provinces.—Such were the *Colonies* of Tyre, Berytus, Heliopolis, Palmyra, &c.

M. Vaillant has filled a volume in folio with medals struck by the several *Colonies*, in honour of the emperors who founded them. The ordinary symbol they engraved on their medals, was, either an eagle; as when the Veteran legions were distributed in the *Colonies*: or a labourer, holding a plough drawn by a pair of oxen; as when the *Colony* consisted of ordinary inhabitants. On all the medals are seen the names of the decemviri, who held the same rank, and had the same authority there, as the consuls had at Rome.

COLOPHONY, a resinous substance prepared of turpentine by boiling it in water, till when cold it becomes of a hard consistence.

The chief use of this drug is in the cure of venereal ailments, seminal weaknesses, the whites in women, &c. The apothecaries make it into pills, which they roll in liquorice-powder, or cover over with gold-leaf, and call them *turpentine pills*.

It is also used by musicians, to rub the hairs of their bow withal; the effect whereof is, that the gum cleaving to the hairs, and communicating to them a tenacious quality, prevents their sliding too easily over the strings; and promotes that trembling which forms the sound.

The common black *Colophony*, or black rosin, is said to be procured from the turpentine of the mountain pine. The oil being extracted from this by distillation, what remains in the still is the *Colophony*.

To be good, it must be shining and odoriferous; and when thrown on the fire, render a smoke like that of frankincense. Pliny says, *Colophony* took its name from *Colephon*, a city of Ionia, whence it was first brought.—It is now frequently called *Spanish wax*, or *Grecian resin*, as it is brought from the one or the other of those countries. It is found to warm, dry, soften, and agglutinate, and usually enters the composition of plasters and unguents.

COLOQUINTIDA*, or **COLOCYNTHIS**, usually called *bitter apple*; the fruit of a plant of the same name, brought from the Levant; about the bigness of a large orange.

- This word comes from the Greek *καλονκυνθες*, a name which was given it, in regard it *καλναι* moves the belly.

Its colour is a sort of golden brown: its infuse is full of kernels, which are to be taken out before the *Colocynth* be used. The pulp is intolerably bitter.

Coloquintida is of considerable use in medicine, but mostly in official compositions; the violence of its operation rendering it unsafe to be given inwardly in extemporaneous prescriptions, except with great caution.

It enters, as an ingredient, in the confectio hameæ, and most of the purging pills; and in such cases as require brisk purging, is attended with great success. But it requires proper management, as it is one of the most violent purgative drugs known; inasmuch that it excoriates the passages to that degree, as sometimes to bring away blood, and induce a superpurgation. Sometimes it is taken boiled in water, or small beer, in obstructions of the menses; which, in strong constitutions, is often attended with success. Some women have got a trick of taking it, in the same manner, in the beginning of pregnancy, to procure abortion; which it often effects by the violence of its operation. The powder of *Coloquintida* is sometimes used externally, with aloes, &c. in unguents, emplasters, &c. with remarkable success against worms; and some, for the same purpose, recommend decoctions of the pulp, given clyster-wise. In the iliac passion, clysters of *Coloquintida* have been found of service, after most other medicines have failed.

Troches made of *Colocynth* are called *troches of albandal*: they are prepared by cutting the *Coloquintida* very small, and reducing it to a fine powder in a mortar, rubbed with oil of sweet almonds; adding gum tragacanth, and mastic afterwards.

COLORBASIANUS. See the article **COLARBASIANUS**.

COLORISATION, or COLORATION, in pharmacy, a term applied to the several changes of colour which bodies undergo in the various operations of nature, or art; as by fermentations, lotions, coctions, calcinations, &c.

COLOSSAL Column. See the article **COLUMN**.

COLOSSUS, a statue of enormous, or gigantic size.

The most eminent of this kind was the *Colossus* of Rhodes, a statue of Apollo, so high, that ships passed with full sails between its legs. It was the workmanship of Chares, a disciple of Lyppus; who spent twelve years in making it; it was at length overthrown by an earthquake, after having stood 1360 years. Its height was sixscore and six foot: there were few people who could fathom its thumb, &c.

Some critics observe, that the *Colossus* of Rhodes gave its own name to the people among whom it stood; and that many, at least among the ancient poets, call the Rhodians, *Colossians*; hence they advance an opinion, that the Colossians in scripture, to whom St Paul directs his epistle, are, in reality, the inhabitants of Rhodes. Of this sentiment are Suidas, Calpene, Munster, &c.

When the Saracens became possessed of the island, the statue was found prostrate on the ground: they sold it to a Jew, who loaded 900 camels with the brass.

The basis that supported it was of a triangular figure, its extremities were sustained with sixty pillars of marble. There was a winding-stair-case to go up to the top of it; from whence one might discover Syria, and the ships that went into Egypt, in a great looking-glass, that was hung about the neck of the statue. Among the antiquities of Rome, there are seven famous *Colossus's*: two of Jupiter, as many of Apollo, one of Nero, one of Domitian, and one of the Sun.

COLOSTRUM, or COLOSTRA, in medicine, the first milk in women's breasts after delivery. See **MILK**.

The name is also given to a disease which this thick coagulated milk sometimes occasions.

COLOUR, COLOR, in philosophy, a property inherent in light, whereby, according to the different sizes, or magnitudes of its parts, it excites different vibrations in the fibres of the optic nerve; which propagated to the sensorium, affect the mind with different sensations.

Or, *Colour* may be defined a sensation of the soul, excited by the application of light to the retina of the eye; and different, as that light differs in the degree of its refrangibility, and the magnitude of its component parts.

In the former view, therefore, light is the subject of *Colour*; in the latter it is the agent. See its properties under the article **LIGHT**.

Various are the opinions of ancient and modern authors, and of the several sects of philosophers, with regard to the nature and origin of the phenomenon *Colour*: the most popular opinion, was long that of the Aristotelians; who maintain *Colour* to be a quality residing in the coloured body; and to exist, independently of light.

The Cartesians come nearer the matter: they own, that as the coloured body is not immediately applied to the organ, to occasion the sensation; and that as no body can affect the sense but by immediate contact; the coloured body does not excite the sensation of itself, or contribute any thing to it, otherwise than by moving some interposed medium, and by that the organ of sight.

They add, that, as we find that bodies do not affect the sense in the dark, light only occasions the sense of *Colour*, by moving the organ; and that coloured bodies are no further concerned

in this, than as they reflect the light with a certain modification: the differences in their *Colours* arising from a difference in the texture of their parts, whereby they are disposed to reflect the light with this or that modification.

But it is to Sir Isaac Newton alone we are to refer for a solid and consistent theory of *Colours*; built on sure experiments, and solving all the phenomena thereof: his doctrine is as follows.

It is found by experience, that rays, or beams of light, are composed of particles very heterogeneous, or dissimilar to each other: *i. e.* some of them, as it is highly probable, are larger, and others less. For a ray of light, as FE, (Tab. *Opticks*, fig. 5.) being received on a refracting surface, as AD, in a dark place, is not wholly refracted to L; but it is split, as it were, and diffused into several radioli, or little rays, some whereof are refracted to L, and others to the other intermediate points between L and G; *i. e.* those particles of the light which are the most minute, are of all others the most easily and most considerably diverted, by the action of the refracting surface, out of their rectilinear course towards L: and the rest, as each exceeds another in magnitude, so is it with more difficulty, and less considerably turned out of its right line to the points between L and G.

Now, each ray of light, as it differs from another in its degree of refrangibility, so does it differ from it in *Colour*: this is warranted by numerous experiments. Those particles, *v. gr.* which are most refracted, are found to constitute a ray of a violet *Colour*, *i. e.* in all probability, the most minute particles of light, thus separately impelled, excite the shortest vibrations in the retina; which are thence propagated by the solid fibres of the optic nerves into the brain, there to excite the sensation of violet *Colour*; as being the most dusky and languid of all *Colours*.

Again, those particles which are the least refracted, constitute a radiolus, or ray of a red *Colour*; *i. e.* the largest particles of light excite the longest vibrations in the retina; so as to excite the sensation of red *Colour*, the brightest and most vivid of all others.

The other particles being in like manner separated, according to their respective magnitudes, into little rays, excite the intermediate vibrations, and thus occasion the sensations of the intermediate *Colours*; much in the same manner as the several vibrations of the air, according to their respective magnitudes, excite the sensations of different sounds.

To this it may be added, that not only the more distinct and notable *Colours* of red, yellow, blue, &c. have thus their rise from the different magnitude and refrangibility of the rays; but also the intermediate degrees or shades of the same *Colour*; as of yellow up to green, or red down to yellow, &c.

Further, the *Colours* of these little rays, not being any adventitious modifications thereof, but connate, primitive, and necessary properties; as consisting, in all probability, in the magnitudes of their parts, must be perpetual and immutable; *i. e.* they cannot be changed by any future refraction or reflection, or any modification whatsoever.

This is confirmed by abundance of experiments; all endeavours having been used, after separating a coloured ray from those of other kinds, to change it into some other *Colour*, by repeated refractions, but to no effect. Apparent transmutations of *Colours*, indeed, may be effected; *viz.* where there is an assemblage, or mixture of rays of different kinds; the component *Colours* never appearing in their natural hue in such mixtures, but always allayed and tempered with each other: whence results a middling kind of *Colour*, which, by refraction, may be separated into the component ones: and those after separation, being remixed, return to their former *Colour*. Hence, the transmutations of *Colours*, by mixing those of different kinds, are not real; but mere appearances or deceptions of the sight; for the rays being again severed, exhibit the same *Colours* as at first. Thus, blue and yellow powders, well mixed, appear to the naked eye green; yet, without having passed any alteration, for when viewed through a microscope, the blue and yellow particles still appear distinct.

Hence there arise two kind of *Colours*, the one original, and simple, produced by homogeneous light; or by rays that have the same degree of refrangibility, and the same magnitude of their parts: such as red, yellow, green, blue, violet purple, orange, and indigo; with all their intermediate tints and gradations. The other kind of *Colour* is secondary, or heterogeneous; compounded of the primary ones, or of a mixture of rays differently refrangible, &c.

There may also be secondary *Colours* produced by composition, like the primary ones, or those consisting of homogeneous light, as to the species or appearance of the *Colour*; but not as to the permanency, or immutability thereof. Thus, yellow and blue make green; red and yellow, orange; orange and yellowish green, yellow: and in the general, if any two *Colours* be mixed, which in the series of those generated by the prism, are not too far apart, from their mixture there results that *Colour*, which in the said series is found in the mid-way between them; but those situated at too great a distance do not so. Indeed, the more any *Colour* is compounded, the less perfect and vivid it is; by too much composition they may be diluted and

and weakened till they cease. By composition there may likewise be produced *Colours* not like any of those of homogeneous light. The most extraordinary composition is that of whiteness; for to this, all the primary *Colours* abovementioned are required; and these to be mixed in a certain degree. Hence it is that white is the ordinary *Colour* of light; light being nothing else but a confused assemblage of rays of all *Colours*.

If the rays of different *Colours* do thus begin to be separated by one refraction of one single surface; that separation is much promoted, so as even to become sensible to the eye by a double refraction. This is observed in the two surfaces of any glass; provided those surfaces be not parallel: but, of all others, it is most sensible in the two faces of a triangular prism; the phenomena whereof, as they are the touchstone of all theories of *Colours*; and as they contain the foundation of that here delivered, we shall lay down as follows.

1°. The rays of the sun, transmitted through a triangular prism, exhibit an image of various *Colours*, (the chief whereof are red, yellow, green, blue, and violet) on the opposite wall.

The reason is, that the differently coloured rays are separated by refraction: for the blue rays, *v. gr.* marked with the dotted line, (Tab. *Optics*, fig. 6.) which begin to be separated from the rest by the first refraction in *dd*, of the side *ca* of the prism *bce*, (as also in the first surface of the globe of water *abc*, fig. 7.) are still further separated in the other side of the prism *bce*, (as also in their egress out of the globe *abc*) by a second refraction in *ce*, in the same direction as the former: whereas, on the contrary, in the plain glass *abcf*, fig. 9. (as also in the prism *gls*, fig. 8. now placed in another situation) those blue rays which begin to be separated from the rest in the first surface, in *dd*, by a second refraction, the contrary way, pass out parallel, *i. e.* remixed with all the *Colours* of the other rays.

2°. This image is not round, but oblong; its length, when the prism is an angle of 60 or 65 degrees, being five times its breadth. The reason is, that some of the rays are refracted more than others; and by that means, they exhibit several images of the sun, extended lengthwise, instead of one.

3°. Those rays which exhibit yellow, are turned further from the rectilinear course, than those which exhibit red; those which exhibit green, farther than those which exhibit yellow: but of all others, those which exhibit violet the most: Accordingly, if the prism through which the light is transmitted be turned about its axis, so as the red, yellow, green, &c. rays be projected, in order, through a narrow aperture into another prism, placed at the distance of about 12 feet; the yellow, green, &c. rays, though falling through the same aperture, in the same manner, and on the same point of the second prism, will not be refracted to the same place as the red, but to a point at some distance from it; on that side to which the rotation is made.

This is what Sir Isaac Newton calls the *experimentum crucis*: being that which led him out of the difficulties into which the first phenomenon, &c. had thrown him; and plainly shewed a different degree of refrangibility, and a different *Colour* corresponding thereto in the rays of light: and that yellow rays, *v. gr.* are more refracted than red ones, green ones more than yellow ones, and blue and violet ones most of all.

4°. The *Colours* of coloured rays, well separated by the prism, are not at all changed or destroyed by passing an illuminated medium, nor by their mutual decussation, their bordering on a deep shadow, nor their being reflected from any natural body, or refracted through any one, in a place howsoever obscure.

The reason is, that *Colours* are not modifications arising from refraction, or reflection, but immutable properties; and such as belong to the nature of the rays.

5°. An assemblage of all the kinds of coloured rays, collected either by several prisms, by a convex lens, or a concave mirror, or in any other manner, form what we call *whiteness*; yet each of these, after decussation, becoming separated, again exhibits its proper *Colour*: for, as the ray was white before its parts were separated by refraction; so, the parts being remixed, it becomes white again: and coloured rays, when they meet together, do not destroy one another, but are only interperfed.

Hence, a red, green, yellow, blue, and violet *Colour*, being mixed in a certain proportion, appear whitish, *i. e.* they are of such a *Colour* as arises from white and black mixed together: and if there were not some rays absorbed and lost, they would be plainly white. In like manner, if a paper cut into a circle, be stained with each of those *Colours*, separately, and in a certain proportion; then swiftly turned round its centre, so as the species of *Colours* be mixed together in the eye, by the briskness of the motion; the several *Colours* will disappear, and the whole paper appear of one continued *Colour*; which will be a mean between white and black.

6°. If the rays of the sun fall very obliquely on the inner surface of a prism, those that are reflected will be violet; those transmitted, red.

For, the rays were coloured before any separation; and by how much they are the more refrangible, by so much they are the more easily reflected; and by that means are separated.

7°. If two hollow prisms, the one filled with a blue fluid, the other with a red one, be joined together, they will be opaque; though each, apart, be transparent.

For, the one transmitting none but blue rays, and the other none but red ones: the two together will transmit none at all.

8°. All natural bodies, especially white ones, viewed through a prism held to the eye, appear frimbriated, or bordered, on one side with red and yellow, and on the other with blue and violet. For, those frimbriae are the extremes of entire images, which the rays of any kind, as they are more or less refracted, would exhibit, nearer, or at a greater distance from the real place of the object.

9°. If two prisms be so placed, as that the red of the one, and the purple of the other meet together, in a paper fit for the purpose, inclosed with darkness; the image will appear pale: and if viewed through a third prism, held to the eye at a proper distance, it will appear double; the one red, the other purple.

In like manner, if two powders, the one perfectly red, the other blue, be mixed; any little body covered pretty deeply with this mixture, and viewed through a prism held to the eye, will exhibit a double image, the one red, and the other blue: in regard, the red and purple of blue rays are separated by their unequal refraction.

10°. If the rays transmitted through a convex lens, be received on a paper before they meet in a focus; the confines or boundary of light and shadow will appear tinged with a red *Colour*: but if they be received beyond the focus, with a blue one. Because, in the first case, the red rays, being somewhat more refracted, are the higher; but, in the second, after decussation in the focus, the blue ones.

11°. If the rays about to pass through either side of the pupilla, be intercepted by the interposition of any opaque body near the eye; the extremes of bodies, placed as if viewed through a prism, will appear tinged with *Colours*; though those not very vivid.

For then, the rays transmitted through the rest of the pupil, will be separated by refraction into *Colours*; without being diluted with the admixture of the intercepted rays, which would be refracted in a different manner.—And hence it is, that a body viewed through a paper pierced with two holes, appears double, and also tinged with *Colours*.

Colours of thin laminae, or plates.—As rays of different *Colours* are separated by the refraction of prisms, and other thick bodies; so are they separated, though in a different manner, in the thin lamellae; or plates of any pellucid matter, *v. gr.* in the bubbles raised in water, thickened by soap, &c. For all lamellae, under a determinate thickness, transmit rays of all *Colours*, without reflecting any at all: but, as they increase in thickness, in arithmetical proportion, they begin to reflect, first, blue rays; then, in order, green, yellow and red, all pure: then, again, blue, green, yellow, red, more and more mixed and diluted; till, at length, arriving at a certain thickness, they reflect rays of all *Colours* perfectly intermixed, *viz.* white.

But, in whatsoever part a slender lamella reflects any one *Colour*, *v. gr.* blue; in that part it always transmits the opposite *Colour*, *v. gr.* red, or yellow.

It is found, by experiment, that the difference of *Colour* of a plate does not depend on the medium that incloses it; but the degree of vividness does: *ceteris paribus*, the *Colour* will be more vivid, if the denser medium be inclosed with the rarer. A plate, *ceteris paribus*, reflects more light as it is thinner; as far as a certain degree of thinness, beyond which it reflects no light at all.

In plates whose thicknesses increase in the arithmetical proportion of the natural numbers 1, 2, 3, 4, 5, &c. If the first, or thinnest, reflect any homogeneous ray, the second will transmit it; the third, again, will reflect it: and thus is the same ray alternately reflected and transmitted; *i. e.* the plates corresponding to the odd numbers, 1, 3, 5, 7, &c. will reflect the same rays that those corresponding to the even ones, 2, 4, 6, 8, &c. transmit. Hence, an homogeneous *Colour* in a plate is said to be of the first order, if the plate reflect all the rays of that *Colour*. In a plate whose thinness is triple the first, it is said to be of the second order: in another, whose thinness is five times that of the first, it is said to be of the third order, &c.

A *Colour* of the first order is the most vivid of any; and, successively, the vividness of the *Colour* increases, as the quantity of the order increases: the more the thickness of the plate is increased, the more *Colours* it reflects; and those of more different orders. In some plates, the *Colour* will vary as the position of the eye varies; in others it is permanent.

Colours of natural bodies. Bodies only appear of different *Colours*, as their surfaces are disposed to reflect rays of this or that *Colour* alone; or of this or that *Colour* more abundantly than any other: hence bodies appear of that *Colour* which arises from the mixture of the reflected rays. See *Body*.

All natural bodies consist of very thin, transparent lamellae; which, if they be so disposed, with regard to each other, as that there happen no reflections or refractions in their interfaces, those bodies become pellucid, or transparent: but if their intervals be so large, and those filled with such matter; or, so empty, (with regard to the density of the parts themselves) as that there happen a number of reflections and refractions within the body; the body, in that case, becomes opaque.

The rays which are not reflected from an opaque body, penetrate into

into it; and there, suffering innumerable reflections and refractions, at length unite themselves to the particles of the body itself.

Hence, an opaque body grows hot the sooner, as it reflects light less copiously: whence, we see why a white body, which reflects almost all the rays that strike upon it, heats much more slowly than a black one, which reflects scarce any.

To determine that constitution of the surface of bodies whereon their *Colour* depends; it must be observed, that the smallest corpuscles, or first particles whereof surfaces are made up, are most thin and transparent, and separated by a medium of a different density from the particles themselves. In the surface, then, of every coloured body, are innumerable smaller thin plates, corresponding to those of bubbles: wherefore, what has been observed of those, may be understood of these.

Hence we gather, that the *Colour* of any body depends on the density and thickness of the parts of the body, between the pores of the surface: that the *Colour* is more vivid and homogeneous, as the parts are thinner; that *cæteris paribus*, the said parts are the thickest when the body is red; and the thinnest when violet: that the parts of bodies are usually much denser, than the medium contained in their interstices; but that in the tails of peacocks, in some silks, and generally, in all bodies whose *Colour* varies according to the situation of the eye, it is less: and that the *Colour* of a body is less vivid to the eye, as it has a denser medium within its pores.

Now, of the several opaque bodies, those consisting of the thinnest lamellæ are black; those consisting either of the thickest lamellæ, or of lamellæ very different from each other in thickness, and on that account fitted to reflect all *Colours*, as the froth of water, &c. are white: those, again, consisting of lamellæ, most of which are of some intermediate thickness, are blue, green, yellow, or red; inasmuch as they reflect the rays of that particular *Colour*, much more copiously than that of any other *Colour*; most of which last they either absorb and extinguish, by intercepting them, or else transmit. Hence it is, that some liquors, *v. gr.* an infusion of lignum nephriticum, will appear red, or yellow, if viewed by reflected light; and blue by transmitted light: and gold leaves yellow in the former circumstances, but green or blue in the latter.

To this may be added, that some of the powders used by painters, have their *Colour* changed by being very finely ground; which must be occasioned by the comminution or breaking of their small parts into others still smaller; just as a lamella has its *Colour* altered, by altering its thickness.

In fine, those old phenomena arising from the mixture of liquors of different *Colours*, can no way be better accounted for, than from the various actions of the saline, &c. corpuscles of one liquor, with the coloured corpuscles of another: if they unite, the mass will either swell or shrink, and thereby its density will be altered; if they ferment, the size of the particles may be diminished, and thereby coloured liquors may become transparent: if they coagulate, an opaque liquor may be produced out of two transparent ones.

Hence, it is easy to see, why a coloured liquid, in a glass of a conical figure, placed between the eye and the light, appears of a different *Colour* in different parts of the vessel; there being more and more rays intercepted, as they pass through a longer or a shorter section of the vessel: till, at the base, they are all intercepted; and none seen but those reflected.

From the various *Colours* of natural bodies, Sir Isaac Newton observes, the signels of their component parts may be estimated: for that the parts of bodies do properly exhibit the same *Colour* with a lamella of equal thickness, provided the density in both be the same.

For the distinct properties, &c. of the several *Colours*. See **BLACK**, **WHITE**, **BLUE**, &c. see also **RAINBOW**, &c.

COLOUR, in painting, is applied both to the drugs, and to the tints produced by those drugs, variously mixed and applied.

The principal *Colours* used by painters, are red, and white lead or cerus; yellow okers; several kinds of earth, as umber, &c. beside orpiment, black lead, cinnabar, gamboge, lake, bice, verdeter, indigo, vermillion, verdgrease, ivory black bistre, lampblack, smalt, ultramarine, and carmine; each of which, with the manner of preparing them, their uses, &c. see under their respective heads.

Of these *Colours*, some are used ground in oil, others only in fresco, other in water, and others only for minature.

Dark and light COLOURS. Under these two classes, the painters reduce all the *Colours* they use: under *light Colours* are comprehended white, and all those which approach nearest it; and under *dark Colours*, black, and all those which are obscure and earthy, as umber, bistre, &c.

Simple and mineral COLOURS, is another division among the painters: under *simple Colours*, they range all those used by limpers, illuminers, &c. extracted from vegetables; and which will not bear the fire: as the yellow made of saffron, of French berries, &c. lacca, and other tinctures extracted from flowers. The rest are *mineral*, drawn from metals, &c. and able to bear the fire: these alone are used in enamelling.

Changeable and permanent COLOURS, is another division of **COLOUR**.

lours: by *changeable*, are meant those which depend on the situation of objects with regard to the eye; as that of taffetas, of a pigeon's neck, &c. The last, however, being attentively viewed with a microscope, each fibre of the feathers appears composed of several little squares, alternately red and green; so that they are really fixed *Colours*.

Kircher tells us, that the *changeable Colours* observed in the necks of pigeons, peacocks, &c. arise from the feathers being transparent, and of a figure resembling a prism; and consequently the light's being differently refracted from them. On the contrary, the fixed and permanent *Colours*, are not exhibited by refraction, but reflection.

M. Mariotte observes, that there are two different gradations, or series's of *Colours*, from white to black; the one white, yellow, red, and black; the other, white, blue, violet, and black.

Local COLOURS. See the article **LOCAL**.

Water COLOURS. See the article **WATER**.

COLOUR, in dying.—There are five simple, primary, or mother-*Colours*, used by the dyers; from the mixture whereof all the other *Colours* are formed: these are blue, red, yellow, brown, and black; each of which fee under their proper head, **BLUE**, **RED**, &c.

Of these *Colours*, variously mixed and combined, they form the following *Colours*; *panfy*, *blue*, *red*: from the mixture of blue and scarlet, are formed *amaranth*, *violet*, and *panfy*: from the same mixture of blue and crimson-red, are formed the *columbine*, or *dove-colour*, *purple*, *crimson*, *amaranth*, *panfy*, and *crimson-violet*. It may be observed, that they give the name *crimson*, to all *Colours* made with cochineal. See **CRIMSON**, **COCHINEEL**, &c.

Of blue, and red madder, they likewise make a good *purple*, a *pepper-colour*, *tan-colour*, and *dry rose*. The same blue, with red half in grain, makes *amaranth*, *tan-colour*, and *dry rose*. Blue, and half red crimson, compose *amaranth*, *tan-colour*, *dry rose*, a *brown panfy*, and *surbrun*.

Blue and yellow. These two *Colours*, mixed together, compose a *yellow green*, *spring green*, *grass green*, *laurel green*, *brown green*, *dark green*; as well as *sea green*, *parrot green*, and *cabbage green*, &c. These three last *Colours* are to be less boiled than the first.

Note, with regard to green, there is no simple ingredient or drug in nature that will dye it; but the stuffs are dyed twice, first in blue, then in yellow.

Blue and brown. These two *Colours* are never mixed alone; but with the addition of red, either of madder or cochineal, they form several *Colours*.

Red and yellow. All the shades composed of these two *Colours*, as *gold-yellow*, *aurora*, *marigold*, *orange*, *nacarant*, *granat-flower*, *flame-colour*, &c. are made with yellow, and red of madder; scarlet being less proper, as well as too dear.

Red and brown. Of these two *Colours* are formed *cinnamon-colour*, *chestnut*, *musk*, *bears-hair*, and even *purple*; if the red be that of madder.

Yellow and brown. The *Colours* formed from these two are all the shades of *feuille-morte*, and *hair-colours*.

It may be observed, that though we say, there are no *Colours*, or shades, made from such and such mixtures; it is not that none can be made; but only that they are more easily formed from the mixture of other *Colours*.

COLOUR Wine. See the article **WINE**.

COLOUR, in heraldry.—The *Colours* generally used in heraldry, are red, blue, black, green, and purple; which, by the learned in that science are called *gules*, *azure*, *sable*, *vert*, or *sinople*, and *purpure*. *Tenne*, or *tawny*, and *sanguin*, are not so common. See each *Colour* under its proper article **GULES**, **AZURE**, **VERT**, **SINOPL**, &c.

As to yellow and white, called *or* and *argent*, they are metals, not *Colours*.

These *Colours* and metals are sometimes also expressed in blazon by the names of precious stones; and sometimes by those of planets, or stars.—Thus, *or* is called *sol*, and *topaz*; *argent*, *luna*, and *pearl*; *gules*, *mars*, and *ruby*; *azure*, *jupiter*, and *sapphire*; *sable*, *saturn*, and *diamond*; *vert*, *venus*, and *emerald*; *purpure*, *mercury*, and *amethyst*; *tenne*, the *dragon's-head*, and *hyacinth*; and *sanguin*, the *dragon's-tail*, and *jardonyx*.

It is a general and fundamental rule in blazon, not to place *Colour* upon *Colour*, nor metal upon metal. That is, if the field be of a *Colour*, the bearing must be of a metal: though this rule, on some occasions, and in some circumstances, is dispensed withal; as in the diminutions and differences which distinguish the younger from the elder branches of families; and in the extremities of animals tongues, claws, horns, &c. In which cases *Colour* may be on *Colour*, and metal on metal, without false heraldry.

Oenomaus is said to have first invented the distinction of *Colours*, to distinguish the quadrille of combatants at the Circenian games: the green for those who represented the earth; and the blue for those who represented the sea.

Hence the ancient cavaliers took occasion to distinguish themselves in their tournaments, by habits, plumes, and ribbands

of different *Colours*; which were ordinarily those of their mistresses, and were the symbol of some passion, or quality.—Hence also the origin of *Colours* in liveries.

COLOURS, in the military art, include the banners, flags, ensigns, &c. of all kinds, bore in an army, a fleet, or the like. See **FLAG**, and **STANDARD**.

FIELD-COLOURS. See the article **FIELD**.

COLOURS, are also used both in the Latin and Greek churches, to distinguish several mysteries and feasts celebrated therein.

In the Latin church are only regularly admitted five *Colours*, viz. *white*, *red*, *green*, *violet*, and *black*: the *white* is for the mysteries of our Saviour, the feasts of the virgin, those of the angels, saints, and confessors; the *red* for the mysteries and solemnities of the holy sacrament, the feasts of the apostles and martyrs; the *green* for the time between pentecost and advent, and from epiphany to septuagesima; *violet* in advent, christmas, in vigils, rogations, and in votive masses in time of war: lastly, *black* for the dead, and the ceremonies thereto belonging. Cloths of gold and silver, and embroideries, serve indifferently for all solemnities.

In the Greek church, the use of *Colours* is almost obliterated, as well as among us: *red*, among them, was the *Colour* for christmas and the dead; as *black* is still for the last among us.

COLOUR, in law, is a probable, or plausible plea; though in reality false at bottom; and only calculated to draw the trial of the cause from the jury to the judge.

Thus, *e. gr.* in an action of trespass for taking away the plaintiff's beasts, the defendant urges, that before the plaintiff had any interest in them, he himself was possessed of them, as his proper goods; and delivered them to A. B. to deliver to him again, when, &c. and A. B. gave them to the plaintiff: and the plaintiff, supposing the property to be in A. B. at the time of the gift, took them; and the defendant took them again from the plaintiff; whereupon the plaintiff brings his action.—This is a good *Colour*, and even a good plea. Doct. and Stud.

COLOUR of office, is when some unjust action is done, under countenance of office, or authority.

To COLOUR strangers goods, is when a freeman allows a foreigner to enter goods at the custom-house in his name.

COLOURABLE Title. See the article **TITLE**.

COLOURING, in painting, the manner of applying, and conducting the colours of a picture; or the mixture of lights and shadows, formed by the various colours, employed in a painting.

The *Colouring* is one of the principal branches in painting. M. Feibain divides the painter's art into three parts; the design, the composition, and the *Colouring*. The *Colouring* strikes the most; but among masters it always gives place to exactness of design.

De Piles observes, that the word *Colouring*, in its confined sense, is chiefly applicable to a history-piece; scarce at all to a landscape. He adds, that the term *Colouring* relates more immediately to the carnations than any thing else.

The *Colouring*, in its general sense, takes in whatever relates to the nature and union of *Colours*; their agreement, or antipathy; as also how to use them to advantage in light and shadow, so as to shew a relieve in the figures, and a sinking of the ground: what relates to the aerial perspective, *i. e.* the diminution of colours by means of the interposition of air; the various accidents and circumstances of the luminary and the medium; the different lights, both of the bodies illuminating and illuminated; their reflections, shadows, different views, with regard either to the position of the eye, or the object: what produces strength, boldness, sweetness, &c. in paintings well coloured: the various manners of *Colouring*, both in figures, landscapes, &c.

Doctrine of COLOURING. *Colours* are considered, either in respect of their use, or their economy and disposition.

With regard to their use. They are either in oil, or water: those in oil, again, may either be considered with a view to their preparation, or application.

In the preparation of oil colours, care must be taken that they be ground fine; that in putting them on the pallet, those which will not dry of themselves, be mixed with drying oil, or other dryers; and that the tinged colours be mixed in as small quantities as possible.

For their application, it is considered either with regard to the kinds of painting, whether in works of various colours, or in those of one single colour.

For the first: in the larger pieces, the colours are either laid on full, so as they may be impacted, or incorporated together, which makes them hold the more firmly.

Or else they mix those more agreeable ones, which dry too hard, and too hastily, with a little colour, and the clearest of the oil: but, in both cases, the colours are to be laid on strong at first; it being easy to weaken those that are to be thrust back, and to heighten the others: the touches to be bold, by the conduct of a free and steady pencil; that the work may appear the most finished at a proper distance, and the figures animated with life and spirit.

For glazed colours, particular care must be taken that the under-colour be painted strong, and that it be a body-colour, and laid smooth.

In finished works, which are to be viewed near at hand, they proceed, either by applying each colour in its place; preferring their purity, without fretting or tormenting them, but sweetly softening off their extremities: or by filling up all the great parts with one single colour; and laying the other colours, which are to form the little things, upon it: which is the more expeditious way, but is more apt to decay.

For the second: the kinds of pictures in one colour are two, viz. *camieux*, where the degradations of colours of objects afar off, are usually managed by lights, as with crayons; and *bas-relievo*, which is an imitation of sculpture, of whatsoever matter and colour: in both these, the colours are wrought dry.

For water colours, they are wrought various ways; viz. in *distemper*, as the painters express it, where the colours are prepared in size; which method is used on all kinds of matter: in *fresco*, or painting on fresh mortar; where the *colouring* must be quick, that the matter dry not; and with much care and neatness, laying each colour in its place, and intermingling them by parcels: in *aguache*, where the colours are mixed with gum, and the pencil dragged; as in paint and washings: in *miniature*, for small and delicate works; where the colours are to be very fine and clean, mixed with gums, and wrought in dots or points.

But in all the kinds of painting, both in oil and distemper, especially the latter, proper care must be taken that the design be fixed, and all the parts marked out, ere any colours be applied. For the 2^d part of *colouring*, or the economy and disposing thereof in paintings; regard is either had, first, to the qualities of the colours, to appropriate them according to their value and agreement: or, secondly, to their effect, in the union and economy of the work.

For the qualities, it must be observed, that white represents light, and gives the briskness and heightening: black, on the contrary, like darkness, obscures and effaces the objects: again, black sets off the light parts; and by that they serve each other to loosen the objects. A proper choice to be made of colours, and the too much charged manner to be avoided; both in carnations, where red colours are not to be affected, as rather resembling the flesh when dead than the skin; and all bright glowing colours: the skin, how delicate soever, being always of a down colour. In the drapery, where the painter has his whole flock of colours to chuse out of, to procure a good effect; and in the landscape, to dispose those colours near one another, which mutually assist and raise each other's force and briskness; as red and green, yellow and blue.

To manage them so, as that they be accommodated to the effects of the great parts of light and colour: that the strong colours lead to the soft ones, and make them more looked at; bringing them forwards, or keeping them back, according to the situation, and the degree of force required.

For the effects of colours, they either regard the union, or the economy: with respect to the first, care must be taken that they be laid so as to be sweetly united, under the briskness of some principal one; that they participate of the prevailing light of the piece; and that they partake of each other by the communication of light, and the help of reflection.

For the economy in managing their degrees, regard is to be had to the contrast, or opposition intervening in the union of the colours, that by a sweet interruption, the briskness, which otherwise fades and palls, may be raised: to the harmony, which makes the variety of colours agree; supplying and sustaining the weakness of some by the strength of others; neglecting some places, on purpose to serve as a basis or repose to the sight, and to enhance those which are to prevail through the piece: to the degradation, where, the better to proportion the colours that fall behind some of the same kind are to be preserved in their purity, as a standard, for those carried afar off to be compared by, in order to justify the diminution: regard being always had to the quality of the air, which, when loaded with vapours, weakens the colours more than when clear: to the situation of the colours, where care must be taken that the purest and the strongest be placed before, or in the front of the piece; and that by their force, the compound ones, which are to appear at a distance, be kept back; particularly, the glazed colours to be used in the first rank: lastly, to the expression of the subject, and the nature of the matters, or stuffs, whether shining or dull, opaque or transparent, polished or rough.

COLOURING and Non-COLOURING drugs: thus the dyers distinguish their materials; the first are applicative, and communicate their colours to the matters boiled in them, or passed through them; as woad, scarlet, green, cochineal, indigo, madder, turmeric, &c.

The second serve to prepare and dispose the stuffs, and other matters; and to extract the colour out of the *colouring* ingredients; as allum, salt, or crystal of tartar, arsenic, realgal, salt-petre, common salt, sal armoniac, sal gemmae, agaric, spirit of wine, bran, pea-flour, wheat, starch, lime, and ashes.

COLUMBINE, a kind of violet-colour, called also *dove-colour*. See **COLOUR**, and **DYING**.

COLUMBUS.—*Congregation of St. COLUMBUS* is the name of a congregation of regular canons, formerly of great extent; having under it an hundred abbeys, or monasteries, in the British islands. See **CONGREGATION**, and **CANON**. The

The principal monastery, or chief of the order, according to some, was at Armagh; according to others, at Londonderry: others will have it in the island of Hui, or Hi, or Iona, now called Ycolmkil, to the north of Ireland, not far from Scotland. There is a rule in Irish verse, supposed to have been dictated by S. Columbus to his canons.

COLUMN, in architecture, a round pillar, made to support, or adorn, a building.

The column is the principal, or reigning part of an architectural order.

The principal laws and properties of this eminent member of architecture are thus deduced.—Every fulcrum or support, is so much the more perfect as it is the firmer, or carries the greater appearance of firmness: and hence all columns, or pillars, ought to have their base, or foot, broader than themselves. See **BASE**. Again, as a cylinder and a quadrangular prism are more easily removed out of their place than a truncated cone, or a pyramid, on the same base, and of the same altitude: the figure of columns ought not to be cylindrical; nor, that of a pilaster, pyramidal; but both the one and the other to be contracted or diminished, *i. e.* to grow less and less, like a truncated cone, and a truncated pyramid.

For the same reason, the lowest parts of columns ought to be cylindrical, that of pilasters pyramidal: hence, again, as columns are more firm, if their diameter bears a greater proportion to their height, than if it bore a less: the greater ratio is to be chosen, where a large weight is to be sustained; and less where a lesser. Further, as the design of a column is to support a weight, it must never be supposed without an entablature: though a column raised on an eminent place, so as to leave no room to fear its being thrust out of its place, needs no pedestal.

The entire column, in each order, is composed of three principal parts, the *base*, the *shaft*, and the *capital*. See the proportions of each under its respective head, **CAPITAL**, &c.

Each of these parts, again, is subdivided into a great number of lesser, called *members*, or *mouldings*: some whereof are essential, and found in all columns; others are only accidental, and found in particular orders.

Columns are different, according to the several orders they are used in; and likewise, not only with regard to their order, but also to their matter, construction, form, disposition, and use.—With regard to order we have the

Tuscan COLUMN, the shortest, and most simple of all the columns.

Its height, according to Vitruvius, Palladio, and Vignola, is seven diameters, or fourteen modules; according to Scamozzi, it is fifteen modules; to De Lorme, twelve; to Trajan's column, sixteen.—Its diminution, according to Vitruvius, is one fourth of the diameter; according to Vignola, a fifth; and according to Trajan's column, a ninth.—Its several parts, mouldings, &c. see under their proper heads. And the entire figure, see represented in *Tab. Architecture*, fig. 24.

Doric COLUMN, is somewhat more delicate: its shaft is adorned with flutings: its height, according to Vitruvius, is from fourteen to fifteen modules: to Scamozzi, seventeen; to Vignola, sixteen; in the Coliseum, nineteen; in the theatre of Marcellus, fifteen two thirds.—Its diminution, according to the theatre of Marcellus, twelve minutes; to the Coliseum, four minutes and a half. See *Tab. Architecture*, fig. 28.

Ionic COLUMN, is more delicate still: it is distinguished from the rest by the volute in its capital; and by its base. See **VOLUTE**. Its height, according to Palladio, is seventeen modules one third; according to Vignola, eighteen.—Its diminution, in the temple of concord, ten minutes and a half; of fortuna virilis, seven and a half; coliseum ten minutes. See *Tab. Architecture*, fig. 32.

Corinthian COLUMN, is the richest and most delicate of all the columns.—Its capital is adorned with two rows of leaves, and with caulicoles; whence spring out little volutes.

Its height, according to Vitruvius, and many remains of antique porticos, temples, &c. is nineteen modules; according to Serlio, eighteen; to the coliseum, 17. 07; to the three columns in the campo vaccino, twenty; the basilica of Antoninus, twenty.—Its diminution, according to the temple of peace, is six minutes and a half; the pantheon, six one eighth; temples of Sibyl and Faustina, eight; Constantine's arch, seven; portico of Septimius, seven and a half. See *Tab. Architecture*, fig. 26.

Composite COLUMN, has two rows of leaves in its capital, like the Corinthian; and angular volutes, like the Ionic. See **COMPOSITE**.

Its height, according to Vignola, and the arch of Titus, is twenty modules; to Scamozzi, and the temple of Bacchus, nineteen and a half; the arch of Septimius, 19. 09.—Its diminution, according to Titus's and Septimius's arches, seven minutes; baths of Diocletian, eleven minutes one third; temple of Bacchus, six and a half. See *Tab. Architecture*, fig. 30.

It may be here observed, that there seems more of caprice than reason in that diversity found in the heights of columns of the same order, in different authors; each of whom frequently takes the liberty of dispensing with his own rules.—Vitruvius, for instance, makes the Doric columns of temples, shorter than those of porticos behind theatres; Palladio gives a greater height to columns standing on pedestals, than to those which have none; and Serlio makes his column a third shorter, when insulate, or

detached, than when contiguous to a wall.

But notwithstanding the diversity of height in columns of this same order in different authors, they still bear a like proportion in the several orders compared with each other; by which they go increasing, as the orders are less massive.

But this augmentation is greater in some ordonnances than in others; for in the antique it is but of five modules, or femidimeters, for the five orders: the shortest column, that is, the Tuscan, being fifteen modules; and the longest, the Composite, twenty. In Vitruvius, this increase is also of five modules; but commences from fourteen modules, and ends at nineteen. The moderns usually make it greater: Scamozzi makes it five modules and a half; Palladio and Serlio, six.

From the several proportions of columns affigned by several authors, M. Perrault has drawn a new one; which is a mean, between the extremes of the rest.—Thus, he makes the Tuscan column fourteen modules two thirds; which is a kind of mean between the Tuscan of Vitruvius, fourteen, and that of Trajan's column, eighteen: the height of the Doric column he makes fifteen modules; which is a mean between the fourteen of Vitruvius, and the nineteen of the coliseum: the Ionic he makes seventeen modules one third; which is a mean between the sixteen of Serlio, and the nineteen of coliseum: the Corinthian column he makes eighteen modules two thirds; as being a medium between the sixteen modules six minutes of the temple of the Sibyl, and the twenty modules six minutes of the three columns of the Roman forum: lastly, the Composite column, by the same rule, he makes twenty modules; that height being a mean between the arch of Titus, and the temple of Bacchus.

Indeed, the rule he proceeds by seems very reasonable; *viz.* that the progressional advance of each column in the different orders is to be equal: so that having settled the whole progression, from the Tuscan to the Composite, at five modules ten minutes; this being a mean between the five modules of the antique, and the five and a half of the moderns; he divides this sum, which is 160 minutes, into four equal parts, giving forty minutes to the progression of each order: this makes the Tuscan column fourteen modules twenty minutes; the Doric becomes sixteen, the Ionic seventeen ten minutes, the Corinthian eighteen twenty minutes, and the Composite twenty modules.

For the distinguishing characters of each order of columns, see **ORDER**.—For the matter of columns, see **STONE**, **MARBLE**, &c.—For their use and application; see **BUILDING**.—For the ranging of columns, and the spaces to be observed between each; see **INTERCOLUMNATION**.

COLUMNS, different with regard to their matter.

Fusible COLUMN. Under this term are comprehended, not only Columns of various metals, and other fusible matters, as glass, &c. but also those of stone, said to have been cast; the secret of which, some will have us believe to have been known to the ancients.

Hydraulic COLUMN, is that whose shaft appears to be of crystal, being formed by a number of little threads of water, falling from holes made in a girt of metal, at equal distances, by means of a pipe mounting through the middle thereof. As in the gardens at Versailles.

Hydraulic COLUMN, also denotes a column from whose top proceeds a jet d'eau, to which the capital serves as a basin; whence the water descends by a little pipe, which turns spirally around the shaft.—Such are the Ionic columns of the cascade of the Belvidera at Fiescati; and those of the vineyard Matthei at Rome.

Moulded COLUMN, is that made by impalpation, of gravel and flints of divers colours, which are bound together with a cement, which grows perfectly hard, and receives a polish like Marble. The secret of making these, it appears the ancients were masters of, by the columns lately discovered near Algiers; which are doubtless the ruins of the ancient Julia Cæsarea: on all these is found the very same inscription in antique characters, the contours, accents, and even faults, being repeated in every shaft: an incontestable proof of their being moulded.

Transparent COLUMN, any column made of transparent matter; as were those of crystal in the theatre of Scaurus, mentioned by Pliny; and those of transparent alabaster, in the church of St. Mark, at Venice.

Water-COLUMN, is a sort whose shaft is formed of a large jet d'eau; which spouting out water violently from the base, drives it within the tambour of the capital, which is made hollow; whence falling down again, it has the effect of a liquid crystal column. See **FOUNTAIN**.—An instance of this we have at Quinta d'Aveiro near Lisbon.

COLUMN of bands, or *tambours*, that whose shaft is formed of several courses of stone, or blocks of marble, less high than the diameter of the column: this is what Ulpian means by *columna stru-tilis*, or *adpacta*; which is opposite to the *columna solida*, or *integrâ*, *i. e.* of one piece.

COLUMNS with regard to their construction.—**COLUMN of joinery**, is that made of strong timber boards, joined, glued, and pinned together; it is hollow, turned in the lathe, and usually fluted. Such are the columns in most altar-pieces.

COLUMN of masonry, is made of rough stone, well laid and covered with

with plaister; or of bricks moulded triangular-wise, and covered with stucco.

COLUMN in truncheon, or pieces, consists of three, four, or five pieces of stone, or metal; differing from the tambours, as being higher than the diameter of the column.

Geminated COLUMNS, that whose shaft is formed of three similar and equal sides, or ribs of stone, fitted within one another; and fastened at bottom with iron pins, and a-top with cramp-irons. This is to be fluted, that the joints may be the less discernible.

Incrusted COLUMN, is made of several ribs, or thin shells of fine marble, or some other rare stone, cemented upon a mould of stone, brick, or the like. This is done with design both to save the precious matter, as oriental jasper, lapis lazuli, agat, &c. or to represent pieces of such stones of an extraordinary size, by the neatness and closeness of the incrustation, which renders the joints imperceptible.

Cabled, or rudented COLUMN, is a column having projectures in form of cables, or canes, in the naked of the shaft; each cable having an effect opposite to that of a fluting; and accompanied with a little list on each side.

Corolitic COLUMN, that adorned with foliages, or leaves and branches turned spirally around the shaft; or in form of crowns and festoons.

These were used by the antients for erecting statues on; which hence took the denomination of *corolitic*.—They are very suitable in triumphal arches, and decorations of theatres.

Colossal COLUMN, a column of enormous size, too large to enter any ordonnance of architecture; to be placed solitary, in the middle of a square, &c.

Such is the Trajan column, whose proportions are Doric, and its profile Tuscan; 12 feet and $\frac{1}{2}$ in diameter, and 100 in height, including the base and the capital: the pedestal of this column has 18 feet, and the crowning 16 and an half. It supports a brazen statue of St. Peter, 13 foot high: the whole making 147 antient Roman feet.—It was built by Apollodorus; and consists of 34 tambours, or blocks, or pieces of white marble, taking in the crowning.

The Antonine column, which is also of white marble, is inferior to the Trajan in beauty of sculpture, but exceeds it in height; being 168 feet to the capital, besides 7 feet of the pedestal under ground. Lastly, the London column, or monument, is of stone, 15 foot in diameter, and 202 high; taking in the pedestal and crowning.

Cylindrical COLUMN, is that which has neither swelling nor diminution.

Diminished COLUMN, is that which has no swelling, but begins to taper, or diminish, from the base; in imitation of trees.

Such are most of the antique columns of granite; particularly the Corinthian ones in the porch of the pætheon.

COLUMNS, denominated from their form.—**Fluted COLUMN**, called also channelled, and striated column; that whose shaft is adorned with flutes, or channellings; either from top to bottom, or only two thirds of its height.

Fluted and cabled COLUMN, is that whose flutes are filled up with cables, reeds, or staves; beginning from the bottom of the shaft, and reaching one third of its height.

Fluted COLUMN enriched, is that whose flutings are filled up with ornaments of foliages, rinds, ribbons, &c. instead of cables.

Gothick COLUMN, a round pillar, either too short for its bulk, or too slender for its height; as having, sometimes, 20 diameters; and this without either diminution, or swelling: yet, its ornaments, and the characters of its work, being as far from those of the antique as its proportions.

Hermetic COLUMN, a kind of pilaster, in manner of a terme; having the head of a man, in lieu of a capital. It had its name from a custom among the antients, of placing Mercury's head, whom the Greeks call *Hermes*, a-top of columns.

Massive COLUMNS, are those too short for the order whose capital they bear; as the pillars in Gothic churches usually are. See **MASSIVE**.

Under the term *massive*, are, likewise, frequently comprehended *rustic* and *tuscan columns*.

Oval COLUMN, that whose shaft has a flatness; its plan being made oval, to reduce the projecture.

Pastoral COLUMN, that whose shaft is formed in imitation of the trunk of a tree, with bark and knots.

This kind of column, in the Tuscan proportion, may be used in the gates of parks and gardens; and in the decoration of pastoral scenes, &c.

Polygonous COLUMN, has several sides, or faces: the most regular of these have eight faces.

This with the oval and cylindrical columns, Daviler regards as abuses in architecture.

Serpentine COLUMN, a column formed of three serpents, twisted together; the heads whereof serve as a capital.

An instance of this is at Constantinople, in the square called *Atmeidan*, antiently the Hippodrome. P. Gyllius calls this the *Delphic column*; as imagining it antiently served for the tripod of Apollo, in the temple at Delphos. It is now ordinarily called the *talisman*, or enchanted column.

Swelled COLUMNS, are those which have a bulging, or swelling, in proportion to the height of the shaft.

Authors are much divided on the subject of this swelling: Sir H.

Wotton treats it as a most ridiculous abuse: yet the practice obtains among the modern architects; who generally make their columns a little bigger at one third of their height, than at the base; i. e. they diminish the column near the base; which makes the upper part appear big, and occasions a swelling at about one third of the height.

This swelling appears to have been unknown to the antients. M. le Clerc observes, it ought not to exceed one minute and a half at most. He thinks it ought never to be used, excepting where there is a particular occasion for it; as where columns are to be placed over one another.

Twisted COLUMN, is that whose shaft is twisted round, in manner of a screw, with six circumvolutions; being, ordinarily of the Corinthian order: Vignola first found a method of drawing it by rule.

Twisted fluted COLUMN, is that whose flutes follow the contour of the shaft, in a spiral line throughout the whole length; whereof there are some antique ones of porphyry, and hard marble.

COLUMN twisted and enriched, is that, one third of whose shaft is fluted, and the rest adorned with foliages and other enrichments: and which being all of marble, is enriched with sculpture from bottom to top.

Sometimes, again, the *twisted column* is formed of two or three slender shafts, twisted round, so as to leave a cavity in the middle. Sometimes the flutings are spiral, yet the shaft straight; which succeeds very well in the more delicate orders.

COLUMNS, denominated from their disposition.—**COLUMN inserted, or backed**, is that let into a wall, a third or fourth part of its diameter.

COLUMN niched, is that whose shaft enters, with half its diameter, into a wall, which is hollowed for its reception; with its plane parallel to the projecture of the tore.

Such is that in the portal of St. Peter at Rome.

Angular COLUMN, is an insulated column, placed in the coin, or corner of a portico; or inserted into the corner of a building: or, even a column that flanks an angle, either acute or obtuse, of a figure of many sides.

Attic COLUMN, according to Pliny, is a pilaster insulated; having four equal faces, or sides; and of the highest proportion, *v. gr.* Corinthian.

Canted COLUMNS, are those engaged in the four corners of a square pillar, to support four springs of an arch.

Coupled COLUMNS, are those disposed by two and two, so as almost to touch each other at their bases, and capitals.

Doubled COLUMN, is an assemblage of two columns, joined in such a manner, as that the two shafts penetrate each other with a third of their diameter. Such are those of the four angles in the court of the Louvre.

Flanked COLUMN, according to M. Blondel, is a column engaged with one half, or at least one third of its diameter, between two demi-pilasters.

Grouped COLUMNS, are those placed on the same pedestal, or socle; either by three and three, or by four and four.

Insulated COLUMN, is that standing free, and detached on all sides, from any other body.

Median COLUMNS. Vitruvius gives the name *columnæ medianæ*, to the two columns in the middle of a porch, which have their intercolumniation larger than the rest: that if these last, for instance, be *perystyle*; the *Medianæ* are *aeolyle*.

The term may also be applied to the middle row of columns, in a frontispiece adorned with three orders.

COLUMNS, denominated from their use.—**Astronomical COLUMN**, is a kind of observatory, in form of a very high tower; built hollow, and with a spiral ascent to an armillary sphere placed a-top, for observing the motions of the heavenly bodies.

Such is that, of the Doric order, erected at the Hotel de Soissons at Paris, by Catherine de Medicis, for the observations of Orontius Fineus, a celebrated astronomer of that time.

Chronological COLUMN, that which bears some historical inscription, digested according to the order of time; as by lustres, olympiads, fasti, epochas, annals, &c.—At Athens there were columns of this kind, whereon were inscribed the whole history of Greece, digested into olympiads.

Funeral COLUMN, is that which bears an urn, wherein are supposed to be inclosed the ashes of some deceased hero; and whose shaft is sometimes overspread with tears, or flames; which are symbols of grief, and of immortality.

Gnomonic COLUMN, is a cylinder, whereon the hour of the day is represented by the shadow of a style.

Of these there are two kinds: in the one, the style is fixed, and the hour-lines are no more than the projection of a vertical dial on a cylindrical surface.

In the other, the style is moveable; and the hour-lines are drawn to the different heights of the sun, in the different seasons of the year.

Historical COLUMN, is that whose shaft is adorned with a baso-relievo, running in a spiral line its whole length; and containing the history of some great personage. Such are the *Trojan* and *Antonine columns*, at Rome.

Historical columns may likewise be divided by bands, or tambours, into separate baso-relievos, containing distinct subjects; by which means, the same columns may likewise be made to answer the end

end of chronological ones.—This manner Vignola prefers to the former; which, he thinks, appears too much confused.

Spiral COLUMN, that which has a spiral stair-case within-side, for the convenience of ascending to the top.—As the *Trajan Column*, the stair-case whereof consists of 185 steps, and is illuminated by 43 little windows. See *Trajan*.—The *Antonine Column* has 198 steps, with 56 windows; each of these is divided by tambours of white marble. The monument or *fire-column*, at London, has also a stair-case; but it does not reach to the top.—These kind of Columns are called also *columnæ coelides*, or *coehides*.

Indicative COLUMN, that which serves to shew the tides, &c. along the sea-coasts. Of this kind, there is one at Grand Cairo, of marble, whereon the overflowings of the Nile are expressed: by this they form a judgment of the succeeding season: when the water, for instance, ascends to 23 foot, it is a sign of great fertility in Egypt.

Instructive COLUMN, that raised, according to Josephus, lib. I. cap. 3. by the sons of Adam, whereon were engraven the principles of arts and sciences.

Baudelot tells us, that the son of Pisistratus raised another of this kind, of stone; containing the rules and precepts of agriculture.

Itinerary COLUMN, a Column with several faces, placed in the cross-ways in large roads; serving to shew the different routs, by the inscriptions thereupon.

Latory COLUMN, at Rome, according to Festus, was a Column erected in the herb-market, which is now the place *Montanara*; which had a cavity in its pedestal, wherein young children, abandoned by their parents, out of poverty or inhumanity, were exposed, to be brought up at the public expence.

Legal COLUMN. Among the Lacedæmonians, there were Columns raised in public places, whereon were engraven the fundamental laws of the state.

Limitrophous, or *boundary COLUMN*, is that which shews the limits of a kingdom, or country conquered.—Such was that, which Pliny says, Alexander the Great erected at the extremities of the Indies.

As to those of Hercules, ordinarily called his *Columns*, or *pillars*; they are only two very steep mountains in the freights of Gades, now Gibraltar.

Luminous COLUMN, is a sort of Column formed on a cylindrical frame, mounted and covered over with oiled paper, or gawze; so that lights being disposed in ranks within, over each other, the whole appears as on fire.

This sort of Column is likewise made with rows of lamps, or torches running round its shaft; either in horizontal belts, or bands; or in a spiral line, over a continued festoon of flowers.

Manubriary COLUMN, from the Latin *manubias*, spoils of the enemy; a Column adorned with trophies, built in imitation of trees, whereon the spoils of enemies were antiently hung.

Memorial COLUMN, that raised on occasion of any remarkable event; as the monument in London, built to perpetuate the memory of the burning of that city, in 1666.

It is of the Doric order, fluted, hollow, with a winding stair-case; and terminated a-top with waving flames.

There is, also, another of the like kind, in form of an obelisk, on the banks of the Rhine in the Palatinate, in memory of the famous passage of that river, by the great Gustavus Adolphus and his army.

Menian COLUMN, any Column which supports a balcony, or *meniana*.—The origin of this kind of Column, Suetonius and Africanus refer to one Menias; who having sold his house to Cato and Flaccus, consuls, to be converted into a public edifice; reserved to himself the right of raising a Column without side, to bear a balcony; whence he might see the shews.

Military COLUMN, was a column of marble, raised by order of Augustus, in the middle of the Roman forum; from whence, as a centre, the distances of the several cities, &c. of the empire were reckoned, by other *military Columns* disposed at equal distances, on all the grand roads.

This Column was of white marble; the same with that which is now seen on the ballustrade of the person of the Capitol at Rome. Its proportion is massive; being a short cylinder, supporting a symbol of the globe of the earth.

It was called *milliarium aureum*, as having been gilt, at least the ball, by order of Augustus. It was restored by the emperors Vespasian and Adrian; as appears by the inscriptions.

Military COLUMN, among the Romans, a Column whereon was engraven a list of the forces in the Roman army, ranged by legions, in their proper order; with design to preserve the memory of the number of soldiers, and of the order preserved in any military expedition.

The Romans had another kind of *military Column*, which they called *columna bellica*, standing before the temple of Janus; at the foot whereof the consul declared war, by throwing a javelin towards the enemies countries.

Phylophical COLUMN, a *light-house*; or a hollow Column, built on a rock, or the tip of a mole, or other eminence, to serve as a lantern to a port.

Rastral COLUMN, that adorned with the beaks or prows of ships, and galleys, with anchors and grapples; erected, either in me-

mony of a naval victory; as the *Tufcan column*, in the capitol; or, in honour of some admiral; as the Doric ones, at the entrance of the castle de Richlieu.

Sepulchral COLUMN, antiently, was a Column erected on a tomb or sepulchre; with an inscription on its base. See *TOMB*, &c. Those over the tombs of persons of distinction were very large; those for the common people small: these last are called *stelæ* and *cippi*.

Statuary COLUMN, that which supports a statue. Such was that erected by pope Paul V. on a pedestal before the church of St. Maria major at Rome; to support a statue of the virgin, which is of gilt brass. See *STATUE*.

This Column was dug up in the temple of peace; its shaft is a single block of white marble 49 foot and an half high, and five foot eight inches diameter; of the Corinthian order, fluted.

The term *statuary Column*, may likewise be applied to Caryatides, Persians, Termini, and other human figures, which do the office of Columns; and which Vitruvius calls *telamones*, and *atlantes*.

Symbolical COLUMN, is a column representing some particular country, by the attributes proper thereto: as that of the French order, set with Flower de Lucies, in the frontispiece of the Jesuits church at Rouen: or some memorable action; as the *corvinian Column*, on which was a crow; erected to Valerius Maximus, surnamed Corvinus, in memory of his defeat of a giant in the army of the Gauls, by the assistance of a crow.

Under the title of *symbolic Columns*, may also be comprehended those which serve for symbols. Such is that on a medal of Nero, which expresses the stability of the Roman empire. See *SYMBOL*.

Triumphal COLUMN, a Column erected among the antients in honour of an hero; the joints of the stones, or courses whereof, were covered with as many crowns, as he had made different military expeditions.

Each crown had its particular name; as *vallis*, which was beset with spikes, in memory of having forced a palisade. *Muralis*, adorned with little turrets, or bartlements; for having mounted an assault. *Navalis*, of prows and beaks of vessels; for having overcome at sea. *Obidionalis*, or *Graminalis*, of grass; for having raised a siege. *Ovans*, of myrtle, which expressed an ovation or little triumph: and *Triumphalis*, of laurel; for a grand triumph.

Procopius tells us of a Column of this kind, erected in the place called Augustum, before the imperial palace of Constantinople, supporting an Equestrian statue of the emperor Justinian.

Zooporic COLUMN, a kind of statuary Column, whereon is placed a figure of some animal. Such is one of the two Columns of the great gate of Venice; whereon is the lion of St. Mark, and the arms of the republic: or that at Sienna, which bears the Wolf that suckled Romulus and Remus.

Scenography of a COLUMN. See the article *SCENOGRAPHY*.

COLUMN, in war, denotes a deep file, or row of troops: or division of an army, which marches at the same time, and towards the same place, at intervals large enough to avoid confusion.

An army marches in one, two, three, or more Columns; according as the ground will allow, and the general sees expedient. The word is sometimes also used in speaking of vessels at sea, following each other in the same line.—It is difficult to form Columns at sea, unless the wind be in stern.

COLUMN, among printers, is half a page, when the page is divided into two parts, from top to bottom. See *PRINTING*.

COLUMNA nafi, is used by some writers of anatomy, for the fleshy end of the nose, jutting out over the upper lip. See *NOSE*.

COLUMNA oris, is sometimes used for the uvula. See *UVULA*.

COLUMNÆ carnae; in anatomy, called also *lacertili*, and *columnæ cordis*; are several small muscles in the ventricles of the heart; derived, and, as it were, detached from the parietes of those ventricles, and connected by tendinous extremities to the valves of the heart.

These little Columns, or pillars, being fastened to the parietes of the heart on one side, and the tricuspid and mitral valves on the other; do by their contraction in the systole of the heart, draw out the valves; and by that means, not only shut the orifices of the veins, but more exactly close their ventricles in their systole.

COLUMNATED winding stairs. See the article *STAIRS*.

COLURES*, in geography and astronomy, are two great circles, imagined to intersect each other at right angles, in the poles of the world.

* The word is derived from the Greek *κοῦρ*, *mutilis*, or *truncatus*, and *αἶψ*, *tail*; *g. d.* appearing with the tail cut off; because never seen entire above the horizon.

The *Colures* pass, one of them through the solstitial, and the other through the equinoctial point of the ecliptic: whence the first is denominated the *solstitial*, and the second the *equinoctial Colure*.

The equinoctial *Colure* determines the equinoxes; and the solstitial, the solstices.

By thus dividing the ecliptic into four equal parts, they also mark the four seasons of the year.

COLYBA, or **COLYBUS**, a term in the Greek liturgy, signify-

ing an offering of corn and boiled pulse, made in honour of the faints, and for the sake of the dead.

Ballamon, P. Goar, Leo Allatius, and others, have wrote on the subject of *colybae*; the substance of what they have said, is as follows.

The Greeks boil a quantity of wheat, and lay it in little heaps on a plate; adding beaten peas, nuts cut small, and grape-stones, which they divide into several compartments, separated from each other by leaves of parsley. A little heap of wheat thus seasoned, they call *colybae*.

They have a particular formula for the benediction of the *colybae*; wherein, praying that the children of Babylon may be fed with pulse, and that they may be in better condition than other people, they desire God to bless those fruits, and those who eat them, because offered to his glory, to the honour of such a faint, and in memory of the faithful deceased.—Balamon refers the institution of this ceremony to S. Athanasius; but the Greek Synaxary to the time of Julian the apostate.

Many of the Latin divines having spoke injuriously of this ceremony, Gabriel archbishop of Philadelphia, has wrote a discourse in its vindication: wherein he endeavours to shew, that the design of it is only, to represent the resurrection of the dead, and to counteract the belief thereof.—The *Colybae*, he says, are symbols of a general resurrection; and the several ingredients added to the wheat, signify so many different virtues.

COMA, in medicine, a sort of sleepy disease, otherwise called *cataplasia*; always bringing on a violent propensity to sleep, whether the sleep ensue or not.

If sleep does ensue, the disease is called *coma somnolentum*, wherein the patient continues in a profound sleep; and when awaked, immediately relapses, without being able to keep open his eyes. If he do not sleep, but is continually awaked with frightful dreams, it is called *coma vigil*: in this case also his eyes are shut, and he appears asleep.

The cause of the *coma somnolentum* may be any thing that prevents the course of the spirits; as a cold humid temperature of the brain; hot putrid vapours ascending into the head, and stopping the canals of the animal spirits; narcotic vapours, &c.

The *coma vigil* is supposed to arise from the conflict, or jarring mixture of bile with pituita; the one urging to sleep, the other to waking. Hence the patient sleeps either not at all, or, at most, but for a moment; is uneasy, starts, rises up, and sometimes throws himself on the persons near him; his eyes continuing all the time fast closed.

The remedies for a *coma*, are those which occasion great evacuations, as violent clysters, or vomitives; medicines that purge, and dry the brain; and those which occasion revulsion of humours; as vesicatories, cauteries, &c. to which may be added volatile spirits, salts, and most cephalics. See SUPPLEMENT, article COMA.

COMA BERENICES, *Berenice's hair*, in astronomy, a modern constellation of the northern hemisphere; composed of unformed stars near the Lions-tail.

The stars in the constellation *coma berenices*, in Ptolemy's catalogue are three; in Tycho's thirteen; in the Britannic catalogue forty. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

Names and Situation of the Stars.	Sign.	Longitude.	Latitude.	Magn.
	♌	0 1 11	0 1 11	
		16 53 24	20 21 46	7
		17 44 9	20 2 11	6
		21 14 30	16 27 0	6
		17 21 15	24 45 23	6
		19 56 6	19 59 7	6
5 First of all in the circle of the hair, to the south.		23 16 44	15 13 55	5
		19 18 19	23 28 33	4 5
		20 24 1	22 56 57	7

		1 10 30	17 48 0	5
	♏	24 57 52	29 58 24	6
Preced. in the hair		25 30 24	30 12 24	5

Names and Situations of the Stars.	Sign.	Longitude.	Latitude.	Magn.
30 More south in the hair	♏	0 39 2	20 48 10	7
		28 59 44	24 42 42	4 5
		2 3 35	21 46 53	5
	♏	25 43 4	23 56 36	5 6
		2 42 23	21 45 14	6
35 Former of 2 in extrem. of the hair	♏	2 5 7	25 55 56	8
		1 22 51	27 14 39	6
		29 1 29	31 49 22	5
Posterior in the extremity of the hair	♏	4 38 35	22 59 12	4 5
40		0 6 31	32 28 33	4

All these stars Ptolemy ranks among the *inferiores* of Leo; and the cluster of little stars, in form of a nebulous one, between the lion and bear, he calls simply *πλεγματιον*; as resembling an ivy leaf; the pointed part whereof is turned towards the north, and the sides bounded by the 7th and 22d stars. Bayer, instead of hair, gives a sheaf of corn.

COMBAT, in a general sense, denotes an engagement; or a difference decided by way of arms.

Authors sometimes distinguish in an army, between a *combat* and a *battel*; the latter expressing the general action of the whole army: the former only a particular skirmish, or engagement of a single part: so that the *combat* is properly a part of a *battel*.

COMBAT, in law, or, *single Combat*, denotes a formal trial, between two champions, of some doubtful cause or quarrel, by the sword, or batons.

This form of proceeding was antiently very frequent; and obtained not only in criminal, but also in civil causes: being built on a presumption, that God would never grant the victory, but to him who had the best right.

We find the *combat* as early as the time of Otho: the last admitted in England, was 6 Car. I. between Donald Lord Rhee, or Rey, and David Ramsey, Esq; in the painted chamber.

The form and ceremony of the *combats*, is described in the grand Coutumier of Normandy: the accuser, first, swore to the truth of his accusation; the accused gave him the iye, upon which, each threw down a gage, or pledge of *battel*; and the parties were committed prisoners to the day of *combat*. See CHAMPION. Historians tell us, that Alphonfus king of Castile, desiring to abolish the Mosaic liturgy, and to introduce the Roman office: the people opposing it, it was agreed to terminate the difference by *combat*; and to leave the cause to the decision of heaven.

COMBAT is also used for the solemn games of the antient Greeks and Romans, performed in honour of their Gods; as the Olympic games, Pythian, Isthmian, and Nemean games; the Ludi Aetiaci, Circenses, &c. which see in their places, OLYMPIC, ISTHMIAN, &c.

The *Combats* here celebrated, were *running*, *wrestling*, *boxing*, *cylus*, &c.—The combatants, who were called *athletae*, prepared themselves for it from their youth, by constant exercise, and a very rigid regimen: they only eat certain things, and at certain hours; drank no wine, had no commerce with women: and both their labour and their rest were regulated.

COMBATANT, is the heralds word for two beasts, as lions, or boars, born in a coat of arms in a fighting posture, erect on their hinder feet and affronted, or with their faces toward each other.

COMBINATION, is properly understood of an assemblage of several things by two and two: but is more particularly used in mathematics to denote the variation, or alternation of any number of quantities, letters, sounds, or the like, in all the different manners possible.

P. Merfenne gives us the *combinations* of all the notes and sounds in musick, as far as 64; the sum whereof amounts to 90 figures, or places.

The number of possible *combinations* of the 24 letters of the alphabet, taken first two by two, then three by three, &c. according to Mr. Prestet's calculation amount to 1391724288887252999425128493402200.

The words in the following verse may be combined a thousand twenty-two several ways.

Tot tibi sunt dotes, virgo, quot sidera caelo.

F. Truchet, in the memoirs of the French academy, shews, that two square pieces, each divided diagonally into two colours, may be arranged and combined 64 different ways, so as to form 64 many different kinds of chequer-work; which appears surprising enough, when one considers that two letters, or figures, can only be combined twice.

This note may be of use to masons, paviours, &c. See PAVEMENT.

Doctrine of COMBINATION.—Any number of quantities being given, together with the number in each combination; to find the number of combinations.

One quantity, we observe, admits of no combination; two, *a* and *b*, of one; of three, *a b c*, there are three combinations, viz. *ab*, *ac*, *bc*; of four, six, *ab*, *ac*, *bc*, *ad*, *bd*, *cd*; of five, ten, *ab*, *ac*, *bc*, *ad*, *bd*, *cd*, *ae*, *be*, *ce*, *de*.

Whence it appears, that the numbers of combinations proceed as 1, 3, 6, 10, &c. i. e. are triangular numbers, whose side differs by

by unity from the number of given quantities. if that *v. gr.* be *g*, the side of the number of combinations will be $g-1$; and therefore the number of combinations $\frac{g-1}{1} \cdot \frac{g+0}{2}$.

If three quantities are to be combined, and the number in each combination be three, there will only be one combination, *abc*; if a fourth be added, the combinations will be found *abc, abd, bcd, acd*; if a fifth, ten, *abc, abd, bcd, acd, abe, bde, cde, ace, ade*; if a sixth, twenty, &c. The numbers of combinations, therefore, proceed as 1, 4, 10, 20, i. e. they are the first pyramidal triangular numbers, whose sides differ by two units from the number of given quantities. See PYRAMIDAL number. Hence, if the number of given quantities be *g*, the side will be $g-2$; and therefore, the number of combinations $\frac{g-2}{1} \cdot \frac{g-1}{2} \cdot \frac{g+0}{3}$.

Hence is easily deduced a general rule of determining the number of combinations in any case: for, suppose the number of quantities to be combined, *g*, the exponent of the combination will be the number of combinations $\frac{g-n+1}{1} \cdot \frac{g-n+2}{2} \cdot \frac{g-n+3}{3} \cdot \frac{g-n+4}{4}$.

$\frac{g-n+5}{5}$, &c. till the number to be added be equal to *n*.

Suppose *v. gr.* the number of quantities to be combined $\equiv 6$; the exponent of the combination 4; the number of combinations will be $\frac{6-4+1}{1} \cdot \frac{6-4+2}{2} \cdot \frac{6-4+3}{3} \cdot \frac{6-4+4}{4} = \frac{6}{1} \cdot \frac{6}{2} \cdot \frac{6}{3} \cdot \frac{6}{4} = 15$.

Coroll. If it be desired to have all the possible combinations of the given quantities beginning with the combinations of the several twos, proceeding to threes, &c. there must be added $\frac{g-1}{1} \cdot \frac{g+0}{2} \cdot \frac{g-1}{1} \cdot \frac{g-1}{2} \cdot \frac{g-1}{3} \cdot \frac{g-2}{2} \cdot \frac{g-1}{1} \cdot \frac{g+0}{2}$, &c.

Whence the number of combinations possible will be $\frac{g \cdot g-1}{1 \cdot 2} + \frac{g \cdot g-1 \cdot g-2}{1 \cdot 2 \cdot 3} + \frac{g \cdot g-1 \cdot g-2 \cdot g-3}{1 \cdot 2 \cdot 3 \cdot 4} + \frac{g \cdot g-1 \cdot g-2 \cdot g-3 \cdot g-4}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}$, &c.

which is the sum of the unities of the binomial, raised to the power *g*, and abridged of the exponent of the power increased by unity, $g+1$. Wherefore, since those unities come out $1+1$, by being raised to the power *g*; and since $1+1=2$, 2^g-1 is the number of all the possible combinations. *V. gr.* If the number of quantities be 5, the number of possible combinations will be $2^5-1=32-1=31$.

Any number of quantities being given, to find the number of changes and alternations, which those quantities, combined in all the manners possible, can undergo.

Suppose two quantities, *a* and *b*: their variations will be 2; consequently, as each of those may be combined, even with itself, to these there must be added two variations. The whole number, therefore, will be $2+2=4$. If there were three quantities, and the exponent of the variation were 2; the combination will be 3, and the changes 9; to which, if the three combinations of each quantity with itself *aaa, bbb, ccc*, be added, we shall have the number of changes, $3+3+3=9$.

In like manner, it is evident, if the given quantities were 4, and the exponent 2, the number of changes would be 16; if 5, 25, &c. and, in general, if *n*.

Suppose the quantities 3, and the exponent of variation 3; the number of changes is found $27=3^3$; viz. *aaa, aab, aba, baa, abb, aac, aca, caa, abc, bac, bca, acb, cab, cba, acc, cac, cca, bba, bab, bbb, bbb, bcb, bcb, bcb, ccb, ccb, ccc*.

After the same manner, it will appear, if the quantities were 4, and the exponent 3, the number of changes would be $64=4^3$; and, in general, if the number of quantities be *n*, and the exponent 3, the number of changes will be n^3 . By thus proceeding, it will be found, that if the number of quantities be *n*, and the exponent *n*, the number of changes will be n^n : wherefore, if all the antecedents be added, where the exponent is less, the number of possible changes will be found $n^1+n^2+\dots+n^{n-1}+n^n$.

Till at length, the number subtracted from *n*, leaves 1; because the beginning is from single quantities taken once.

Since then the number of possible changes is in a geometrical progression, whose first or smallest term is n^1 , the greatest n^n , and the denominator *n*; it will be $\frac{n^1+n^2+\dots+n^n}{n-1}$.

Suppose *v. gr.* $n=4$, the number of possible changes $(4^5-4)/(4-1)=1020/3=340$. Suppose, again, $n=24$, the number of possible changes will be $(24^{25}-24)/(24-1)=3200965875/23=1391722888725/23=59992299425128493402200$. In so many various manners, therefore, may the 24 letters of the alphabet be varied and combined among themselves.

COMBING of wool, in commerce, the drawing, or passing wool across the teeth of a kind of card, called a *comb*, to dispose it for spinning.

COMBS of bees. See the article HONEY-COMB.

COMBURENDO *hæretico*. See the article HÆRETICO.

COMBUS *gr.* in astronomy. When a planet is in conjunction with the sun, or not distant from it above half their disk; it is said to be *combust*, or in *combustion*.

According to Argol, a planet is *combust*, or in *combustion*, when not above eight degrees and thirty minutes distant from the sun, either before or after him.

COME.—The small fibres or tails of malt, upon its first shooting forth, is thus called.

COMEDY, in its proper sense, a dramatic piece, representing some agreeable and diverting transaction: or an allegorical representation of something in private life; for the amusement and instruction of the spectators.

In this sense, *comedy* is opposed to *tragedy*, the subjects whereof are grave, and violent; and the persons of the first rank.

Scaliger defines *comedy*, a dramatic poem, very busy, pleasant in the conclusion, and written in a popular style.—Aristotle calls it an imitation of the worst, or, rather, of the lowest class of persons, by way of ridicule: this definition Corneille finds fault with, and maintains, that the actions of kings themselves may enter *comedy*; provided they be such as are not very momentous, nor attended with any considerable danger. He adds, that a poem wherein the greatest peril is the loss of a mistress, has no right to any higher appellation than that of *comedy*; but then he makes a distinction in *comedies*, and dignifies those where great personages are introduced, with the epithet of *heroic comedies*, to distinguish them from the ordinary ones.

Mr. Congreve seems pretty much of the same sentiment: he understands Aristotle's definition as meant of the worst men; on which bottom, it is sufficient to constitute a *comedy*, that the action represented be that of some ill man brought on the stage to be exposed.

M. Dacier is of a contrary opinion: he maintains, that *comedy* allows of nothing grave, or serious, unless it be turned to ridicule; and that raillery and ridicule are its only proper and genuine characteristics: in which opinion he is warmly seconded by Mr. Dennis.

Thus different are critics and comic authors on the nature of *comedy*: some distinguish it from tragedy by the lowness of the subject; others by the ridiculous light it is set in.

The accurate F. Boffu fixes the notion of *comedy* much better: according to that critic, *comedy* differs from tragedy in this, that the comic writer invents both the names of his persons, and the action which he presents, whereas the tragic writers only invent the latter; the former they are to take from history. See ACTION. Upon the whole, *comedy* may be defined an image, or representation of the ordinary life of men: it exhibits their common actions and passions; exposes, and ridicules their failings, to preserve the spectators from them, or to correct them. Cicero defines it in the imitation of life, the mirror of custom, and the image of truth.

There is a dispute among critics, whether *comedy* be a poem, or a mere conversation? They who maintain the latter, do it on the foot of this general opinion, that a poem is a discourse in verse: F. Boffu insists on the former, and shews, that as *comedy* has the fable, or allegory, it has every thing essential to poetry.

Comedy and *tragedy* were originally one, and the same thing: their common origin see under TRAGEDY.—M. Boileau says, *comedy* took its rise at Athens, from the happy issues or conclusions of tragedies. On this principle, the catastrophe should have been the proper criterion, or distinguishing mark between *tragedy* and *comedy*; and all other differences only accidental.

Des succès fortuneux du spectacle tragique

Dans Athènes naquit la comédie antique.

After the grave and serious became separated from the ridiculous, and *tragedy* and *comedy* were become two distinct arts; people applied themselves to cultivate the former, and neglected the latter: so that *comedy* continued in its infancy, with little improvements, while *tragedy* grew up to a perfect art: this once arrived at its height, they began to think of cultivating *comedy*. With regard to the various changes and revolutions *comedy* has undergone, it is commonly distinguished into three kinds, viz. the *antient*, wherein there was nothing feigned; the *middle*, where the subject was real, but the names fictitious; the *new*, where both names and things are fictitious.

The *antient* was that first in use, when the supreme power was in the hands of the people; and when, on that account, the poets were at their full liberty to say what they pleased, and of whom they pleased; by name to rail at people in authority, and openly to charge magistrates with crimes; sparing no age, sex, or quality.

This is very observable in the frogs, and the clouds of Aristophanes; where it is to be noted, that though the railing part was occasionally distributed among all the actors, yet the chief of it was laid on the chorus.

When the Athenian liberties became sunk up in the tyranny of a few, it was no longer safe for the poets to use their old license; men of office being now to be screened from reproach. The chorus, therefore, became useless, and was therefore dropped; and thus commenced what we call *comœdia media*, *µεν*, or the *middle comedy*. See CHORUS.

Under this, the poets were not allowed to name the persons; and therefore names were to be invented; but then the persons were so well pointed out, that it was no difficult matter to know them.

At length, however, they were obliged to repress even this licence: and this reform gave occasion to the *new comedy*; which only brought upon the stage feigned adventures, and imaginary names.

This last kind alone was received among the Romans; who yet made a new subdivision thereof, into *antient*, *middle*, and *new*; according to the various periods of the commonwealth. Among the *antient comedies* were ranked those of Livius Andronicus; among the *middle*, those of Pacuvius; and among the *new ones* those of Terence.

Comedy, as well as tragedy, has its essential, and its integrant parts.—Its essential parts, in the language of the antients, are the *protasis*, *epitasis*, *catastasis*, and *catastrophe*.

The *protasis* is the beginning, or opening; where the subject is just entered upon, the character of the persons shewn, and the interest, or part each has in the action signified.

In the *epitasis*, the intrigues begin: they are carried on, and heightened in the *catastasis*; and unravelled in the *catastrophe*.

The integrant parts are the five acts into which the *comedy* is divided, agreeable to that precept of Horace;

Novus minor quinto non fit productior actu.

The acts are divided into scenes: the number whereof is not fixed, either by reason or experience, but depends on the business to be done in each act, and the number of persons to be employed. See ACT, SCENE, &c. see also MANNERS, HUMOUR, &c.

Among the antient Romans, *comedies* were distinguished according to the quality of the persons represented, and the dress they wore, into *togatae*, *pretextae*, *trabatae*, and *tabernariae*; which last were those where the scene lay in colleges, or among people of the lowest rank, agreeing pretty nearly with our farces.

In the representation, *comedy* was distinguished from tragedy by the *jack* wore in the former, and the *buskin* in the latter.

Among us, *comedy* is distinguished from *farce*, in that the former represents nature as she is; the other distorts or overcharges her. They both paint from the life, but with different views: the one to make nature known, the other to make her ridiculous.

COMET, a heavenly body, in the planetary region, appearing suddenly, and again disappearing, and during the time of its appearance moving in its proper, though very excentric orbit, like a planet.

Comets, properly called *blazing stars*, have this to distinguish them from the other stars, that they are usually attended with a long train, or tail of light, always opposite to the sun, and which is of a fainter lustre, the further it is from the body. Hence arises a popular division of *comets* into three kinds, *viz.* *bearded*, *tailed*, and *hairy comets*; though in effect, this division rather relates to the several circumstances of the same comet, than to the phenomena of several.

Thus, when the comet is eastward of the sun, and moves from it, the comet is said to be *bearded*, *barbatus*; because the light marches before it, in manner of a beard. See BEARD.

When the light is westward of the sun, and sets after it, the comet is said to be *tailed*, *caudatus*; because the train follows it, in manner of a tail. See TAIL.

Lastly, when the comet and the sun are diametrically opposite, (the earth between them) the train is hid behind the body of the comet, excepting a little that appears around it, in form of a border of hair, hence called *crinitus*.

Nature of COMETS.—As to the nature of *comets*, the unfrequency of their appearing, together with the seeming irregularities of their phenomena, have left philosophers much in the dark: those who lived before Aristotle, accounted for them by supposing the heavenly spaces full of an infinite number of stars; and many of these too remote, or too small to have ever come under the notice of astronomers: these invisible stars, they further supposed to move by their own proper motion every way; finishing their courses in very unequal times. Now, a comet, according to them, was a vast heap or assemblage of these little stars meeting together, by reason of the inequality of their motions, and uniting into a visible mass; which must again disappear, as those stars separated, and each proceeded in its course.

But how these stars should thus meet, coalesce and form a body, which in all positions of the sun should resemble a tail, and again separate, is a mystery!

This opinion therefore, Aristotle easily overturned; substituting another in its stead: according to him, *comets* were only a kind of transient fires, or meteors, consisting of exhalations raised to the upper region of the air, and there set on fire; far below the moon's course.

But neither is this hypothesis more just than the other: for on this principle, the light of the comet being independent of the sun, would be dispersed every way alike, without any appearance of a train, or tail, which is contrary to the phenomena. Besides that the modern astronomers, who have measured the distance between the *comets* and the earth, find that the *comets* have no sensible parallax; which could not be, were they not much more remote than the moon, whose parallax is sensible. See PARALLAX.

Hævelius, from a great number of observations, proposes it as his

opinion, that the *comets*, like the solar maculae or spots, which they pretty much resemble, are formed and condensed out of the grosser exhalations of his body. In which notion he agrees nearly with Kepler, who maintains, that *comets* are generated in the æther in vast numbers, like fishes in the ocean; though they do not all become visible, either because of their smallness, or because they lay a long time under the horizon.

But Sir Isaac Newton has shewn the fallacy of this hypothesis, by proving that the comet of 1680, in its passage through the neighbourhood of the sun, would have been dissipated, had it consisted of exhalations of the sun and planets: for the heat of the sun, it is allowed, is as the density of his rays, *i. e.* reciprocally as the squares of the distances of places from the sun: wherefore, since the distance of that comet in its perihelion, December the 8th, was observed to be to the distance of the earth from the sun, nearly as 6 to 1000; the sun's heat in the comet, at that time, was to his heat with us at midsummer, as 1000000 to 36, or 28000 to 1.

And again, finding by experiment, that the heat of boiling water is little more than three times the heat of our dry earth, when exposed to the midsummer's sun; and assuming the heat of red-hot iron to be about three or four times as great as that of boiling water; he thence concludes, that the heat of the dried earth, or body of the comet in its perihelion, must be near 2000 times as great as that of red-hot iron.

Such an immense heat once acquired in its perihelion, the comet must be a long time in cooling again. The same author computes, that a globe of red-hot iron, of the dimensions of our earth, would scarce be cool in 5000 years. If then the comet be supposed to cool 100 times as fast as red-hot iron; yet since its heat was 2000 times greater, supposing it of the bigness of the earth, it would not be cool in a million of years.

James Bernoulli, in his *systema cometarum*, supposes some primary planet, revolving round the sun in the space of four years and 157 days; and at the distance, from his body, of 2583 semidiameters of the magnus orbis: this planet, he concludes, either from its vast distance, or smallness, to be invisible to us; but, however, to have at various distances from him, several satellites moving round him, and sometimes descending as low as the orbit of Saturn; and that these becoming visible to us, when in their perigeum, are what we call *comets*.

Des Cartes advances another opinion: he conjectures that *comets* are only stars, formerly fixed, like the rest, in the heavens; but which, becoming by degrees covered with maculae, or spots, and at length wholly robbed of their light, cannot keep their place, but are carried off by the vortices of the circumjacent stars; and, in proportion to their magnitude and solidity, moved in such manner, as to be brought nearer the orb of Saturn; and thus coming within reach of the sun's light, rendered visible.

But the vanity of all these hypotheses abundantly appears from the phenomena of *comets*; the chief of which we shall enumerate: as being the test by which all theories are to be tried.

1st. First, then, those *comets* which move according to the order of the signs, do all, a little before they disappear, either advance slower than usual, or else go retrograde, if the earth be between them and the sun; and more swiftly, if the earth be situate in a contrary part: on the contrary, those which proceed contrary to the order of the signs, proceed more swiftly than usual, if the earth be between them and the sun; and more slowly, or go retrograde, when the earth is in a contrary part.

2^o. So long as their velocity is increased, they move, nearly, in great circles; but towards the end of their course, they deviate from those circles; and as often as the earth proceeds one way, they go the contrary way.

3^o. They move in ellipsis, having one of their foci in the center of the sun; and by radii drawn to the sun, describe areas proportionable to the times.

4^o. The light of their bodies, or nuclei, increases in their recess from the earth towards the sun; and on the contrary, decreases in their recess from the sun towards the earth.

5^o. Their tails appear the largest and brightest, immediately after their transit through the region of the sun.

6^o. The tails always decline from a just opposition to the sun towards those parts which the bodies, or nuclei pass over, in their progress through their orbits.

7^o. This declination, *cæteris paribus*, is the smallest, when the heads, or nuclei, approach nearest the sun; and is less, still, near the nucleus of the comet than towards the extremity of the tail.

8^o. The tails are somewhat brighter, and more distinctly defined in their convex than in their concave part.

9^o. The tails always appear broader at their upper extreme than near the center of the comet.

10^o. The tails are always transparent, and the smallest stars appear through them.

These are the chief phenomena of *comets*; which, how ill they consist with the wild notions of the antients, and the weak conjectures of most of the moderns, is pretty evident. Indeed, there were some, Pliny tells us, among the antients, who 'had

'juster notions, who took these stars to be perpetual, and believed they moved in their proper orbs; but were never seen

'unless

‘ unless when left by the sun? and more fully Seneca, *quæst. nat. lib. 7*. ‘ I am not of the common opinion, nor do I take a comet to be a sudden fire, but esteem it among the eternal works of nature.—*Quid autem miramur cometas, tam rarum mundi spectaculum nondum teneri legibus certis, nec initia illorum finisque innotescere, quorum ex ingentibus intervalis recursus est?—Venit tempus quo ista quæ nunc latent, in lucem dies extrahat & longior ævi diligentia. Venit tempus quo posteri nostri tam aperta nos neficisse mirentur.—Erit qui demonstret aliquando, in quibus cometæ partibus errent; cur tam seducti a cæteris eant, quanti quæque sint.*—

This prediction we have seen accomplished in our days, by the great Sir Isaac Newton; whose doctrine is as follows.

The comets, he says, are compact, solid, fixed, and durable bodies; in one word, a kind of planets; which move in very oblique orbits, every way with the greatest freedom; persevering in their motions, even against the course and direction of the planets; and their tail is a very thin, slender vapour, emitted by the head, or nucleus of the comet, ignited or heated by the sun.

This at once solves all the phenomena: for 1st. ‘ It is evident, that those which proceed according to the order of the signs, a little before they disappear, must move more slowly, or appear retrograde, if the earth be betwixt them and the sun, and swifter, if the earth be in a contrary part: on the contrary, those proceeding against the order of the signs, &c.’—For since this course is not among the fixed stars, but among the planets; as the motion of the earth either conspires with them, or goes against them; their appearance, with regard to the earth, must be changed; and, like the planets, they must sometimes appear swifter, sometimes slower, and sometimes retrograde.

2^d. ‘ When the comets move the swiftest, they must proceed in straight lines, but in the end of their course decline, &c.’—Because in the end of their course, when they recede almost directly from the sun, that part of the apparent motion which arises from the parallax, must bear a greater proportion to the whole apparent motion.

3^d. ‘ The comets must move in ellipses, having one of their foci in the centre of the sun.’—Because they do not wander precariously from one fictitious vortex to another; but, making a part of the solar system, return perpetually, and run a constant round.

Hence, their elliptic orbits being very long and excentric, they become invisible, when in that part most remote from the sun.

From considering the curvity of the paths of comets, Sir Isaac concludes, that when they disappear, they are much beyond the orb of Jupiter; and that in their perihelion they frequently descend below the orbits of Mars and the inferior planets.

4th. ‘ The light of their nuclei must increase in their recess from the sun, and vice versa.’—Because, as they are in the regions of the planets, their access toward the sun bears a considerable proportion to their whole distance.

From observations of the comet of 1680, Sir Isaac Newton found that the vapour in the extremity of the tail, Jan. 25, began to ascend from the head before December the 11th; and had therefore spent more than 45 days in its ascent: but that all the tail which appeared December 10, ascended in the space of those two days, then just past since its perihelion. The vapour, therefore, at the beginning, when the comet was near the sun, ascended prodigiously swift; and afterwards continued to ascend with a motion retarded by the gravity of its particles; and by that ascent increased the length of the tail: but the tail, notwithstanding its length, consisted almost wholly of vapours, which had ascended from the time of the perihelion; and the vapour which ascended first, and composed the extreme of the tail, did not vanish, till it was too far from the sun to be illumined by him, and off us to be visible. Hence, also, the tails of comets that are shorter, do not ascend with a quick and continual motion from the head, and then presently disappear; but are permanent columns of vapours and exhalations, gathered from the head by a very gentle motion, and in a great space of time; which yet, by participating of that motion of their heads they had at the beginning, continue easily to move along with their heads through the celestial regions: whence also the vacuity of those regions is argued. See VACUUM.

5th. ‘ Their tails must appear the largest and brightest immediately after their transit through the region of the sun.’—because, then, their heads being the most heated, will emit the most vapours.

From the light of the nucleus, or apparent star, we infer their vicinity to the earth, and that they are by no means in the region of the fixed stars, as some have imagined; since in that case, their heads would be no more illumined by the sun, than the planets are by the fixed stars.

6th. ‘ The tails must still decline from a strict opposition to the sun, towards those parts which the heads pass over, in their progress through their orbits.’—because, all smoke, or vapour emitted from a body in motion, tends upwards obliquely, still receding from that part towards which the smothering body proceeds.

7th. ‘ That declination will be still the least near the nucleus of the comet; and when the comet is nearest the sun.’—because the vapour ascends more swiftly near the head of the comet, than in

the higher extremity of its tail; and when the comet is at a less distance from the sun, than when at a greater.

8th. ‘ The tail is brighter, and better defined in its convex part, than in its concave.’—because the vapour in the convex part, which goes first, being somewhat nearer and denser, reflects the light more copiously.

9th. ‘ The tail must appear broader towards the higher extremity of the comet, than towards the head.’—because, the vapour in a free space perpetually rarefies and dilates.

10th. ‘ The tails must be transparent.’—because consisting of infinitely thin vapour, &c.

Thus accurately does the hypothesis tally to the phenomena.

Phases of COMETS.—The nuclei, which we also occasionally call the heads and bodies of comets, viewed through a telescope, shew a very different face from those of the fixed stars, or planets. Sturmius tells us, that observing the comet of 1680, with a telescope, it appeared like a coal dimly glowing, or a rude mass of matter illumined with a dusky fumid light, less sensible at the extremes than in the middle; rather than as a star, which appears with a round disk, and a vivid light.

Hevelius observed of the comet of 1661, that its body was of a yellowish colour, very bright and conspicuous, but without any glittering light: in the middle was a dense ruddy nucleus, almost equal to Jupiter, incompanied with a much fainter thinner matter. Feb. 5. its head was somewhat bigger and brighter, of a gold colour; but its light more dusky than the rest of the stars: here, the nucleus appeared divided into several parts. Feb. 6. the disk was lessened; the nuclei still existed, though less than before: one of them, on the lower part of the disk, on the left, much denser and brighter than the rest; its body round, and representing a very lucid little star: the nuclei still incompanied with another kind of matter. Feb. 10. the head somewhat more obscure, and the nuclei more confused, but brighter at top than bottom. Feb. 13. the head diminished much, both in magnitude and brightness. March 2. its roundness a little impaired, its edges lacerated, &c. March 28. very pale and exceeding thin; its matter much dispersed; and no distinct nucleus at all appearing.

Weigelius, who saw the comet of 1664, the moon, and a little cloud illumined by the sun at the same time; observed, that the moon, through the telescope, appeared of a continued luminous surface; but the comet very different; being perfectly like the little cloud in the horizon, illumined by the sun. From these observations it was, that Hevelius concluded comets to be like maculae, or spots formed out of the solar exhalations.

The length of the tails of comets is various: that of 1680, according to Sturmius, about the 20 of November, was but small, at most not exceeding 20 degrees in length: in a little time it grew to a length of 60 degrees, after which it dwindled very sensibly.

Formation of the tails of COMETS.—Sir Isaac Newton shews, that the atmospheres of comets will furnish vapour sufficient to form their tails: this he argues from that wonderful rarefaction observed in our air, at a distance from the earth: a cubic inch of common air, at the distance of half the earths diameter, or 4000 miles, would necessarily expand itself so as to fill a space larger than the whole region of the stars. Since then the coma, or atmosphere of a comet is ten times higher than the surface of the nucleus, counting from the center thereof; the tail, ascending much higher, must needs be immensely rare: so that it is no wonder the stars should be visible through it.

Now, the ascent of vapours into the tail of the comet, he supposes occasioned by the rarefaction of the matter of the atmosphere at the time of the perihelion. Smoke, it is observed, ascends the chimney by the impulse of the air wherein it floats; and air, rarefied by heat, ascends by the diminution of its specific gravity, taking up the smoke along with it: why then should not the tail of a comet be supposed to be raised after the same manner by the sun? for the sun-beams do not act on the mediums they pass through, any otherwise than by reflection and refraction.

The reflecting particles, then, being warmed by the action, will again warm the æther wherewith they are compounded; and this, rarefied by the heat, will have its specific gravity, whereby it before tended to descend, diminished by the rarefaction; so as to ascend, and to carry along with it those reflecting particles, whereof the tail of the comet is composed.

This ascent of the vapours will be promoted by their circular motion round the sun; by means whereof, they will endeavour to recede from the sun, while the sun's atmosphere, and the other matters in the celestial spaces, are either at rest, or nearly so; as having no motion but what they receive from the sun's circumrotation.

Thus are the vapours raised into the tails of comets in the neighbourhood of the sun, where the orbits are most curve; and where the comets being within the denser atmosphere of the sun, have their tails of the greatest length.

The tails thus produced, by preserving that motion, and at the same time gravitating towards the sun, will move round his body in ellipses, in like manner as their heads; and by this means, will ever accompany, and freely adhere to their head. In effect, The gravitation of the vapours towards the sun, will no more

occasion the tails of the *comets* to forsake their heads, and fall down towards the sun, than the gravitation of their heads will occasion them to fall off from their tails: but by their common gravitation, they will either fall down together to the sun, or be together suspended, or retarded. This gravitation, therefore, does not at all hinder, but that the heads and tails of *comets* may receive and retain any position towards each other, which either the above-mentioned causes, or any other, may occasion. The tails, therefore, thus produced in the perihelion of *comets*, will go off along with their head into remote regions; and either return thence, together with the *comets*, after a long series of years; or, rather, be there lost, and vanish by little and little, and the *comet* be left bare; till at its return, descending towards the sun, some little short tails be gradually and slowly produced from the heads; which afterwards, in the perihelion, descending down into the sun's atmosphere, will be immensely increased.

The vapours, when they are thus dilated, rarefied, and diffused through all the celestial regions, the same author observes, may probably, by little and little, by means of their own gravity, be attracted down to the planets, and become intermingled with their atmospheres.
